We agree with the commenter's suggestion that the inflation factor should be applied to the hospital's data based on the reporting period's midpoint rather than its year end. This calculation will not affect most hospitals' data as a full year was reported and the inflation factor for these hospitals will be the same. In addition, because of this change, data from hospitals whose first year prospective payment system cost reporting period ended after August 31, 1985, will be deflated to the common point. We have also made corrections to the 1984 data for any reporting period data errors, including first year prospective payment system cost reporting periods ending September 30, 1985.

Comment: A few commenters suggested that a regional wage index be developed to replace the current wage index which is based on MSAs. The commenters believe that this type of wage index would be more accurate and fairer to rural hospitals that are near urban areas and must compete in the same labor markets.

Response: The MSA/NECMA definitions as established by the Office of Management and Budget are widely accepted and are used by many Federal programs to account for and recognize economic and population differences among urban areas. We do not believe that a regional wage index would account for wage differences experienced by areas that are geographically close to one another. We believe that a regional wage index would ignore the sometimes large variations that often exist within regions. We intend to examine the issue of labor market areas in conjunction with the development of the FY 1991 wage index.

C. Revisions to the Wage Index for Rural Counties Whose Hospitals Are Deemed Urban

Under section 1886(d)(8)(B) of the Act, for discharges occurring on or after October 1, 1988, hospitals in certain rural counties adjacent to one or more Metropolitan Statistical Areas (MSAs)

are considered to be located in one of the adjacent MSAs if certain standards are met. Because of this provision, as a part of the September 30, 1988 final rule, we reclassified the wage data for those rural areas as if the hospitals in those areas were located in the adjacent MSAs and recomputed the wage index values for the affected MSAs and rural areas.

Because inclusion of the wage data from rural hospitals that are considered to be located in an adjacent MSA under section 1886(d)(8)(B) of the Act resulted in the reduction of the wage index values of several MSAs and rural areas, Congress enacted section 8403(a) of Pub. L. 100–647. Under that provision, which added a new section 1886(d)(8)(C) to the Act, if the inclusion of wage data from rural hospitals now considered to be located in an urban area results in a reduction of the wage value for the affected MSA or rural area, then the wage index values for those affected areas must be recomputed as if section 1886(d)(8)(B) of the Act had not been enacted. The wage index value for those rural counties with hospitals that were deemed urban and that are affected by this recomputation must be calculated separately. This provision is effective for discharges occurring on or after October 1, 1989 and before October 1, 1991.

Therefore, we proposed to calculate the wage index for FY 1990 in the following manner with respect to the geographic classification of hospitals:

- MSAs whose wage index values are reduced because of the inclusion of wage data from hospitals in adjacent rural counties that have been deemed to be located in the MSAs would have their wage index values recalculated as if section 1886(d)(8)(B) of the Act had never been enacted; that is, data from the rural hospitals would be excluded in calculating these MSAs' wage index values.
- Each county whose hospitals have been deemed to be located in such an MSA would have its own unique wage index value, that is, a wage index value calculated on a county-specific basis.
- Rural areas whose wage index values are reduced by the exclusion of wage data from hospitals that have been deemed to be located in adjacent MSAs would have their wage index recalculated as if those hospitals were not deemed to be urban. In this case, the wage data for hospitals located in the rural counties that have been deemed urban would be included in two wage areas, that is, both the affected rural area and the county-specific wage area for the deemed hospitals. Those rural areas whose wage index values are increased by the exclusion of the wage data for those hospitals that have been deemed urban would retain the increased wage index value.

Using 1984 data, the proposed wage index value for every MSA in which rural hospitals have been deemed to be located was lower than it would have been if those hospitals had not been included. Therefore, the proposed wage index value for the MSA was computed without including data from the deemed rural hospitals and the proposed wage index value was computed on a county-specific basis for every rural county whose hospitals have been deemed to be urban. As proposed, there were seven rural areas that had their wage index value recalculated to include the hospitals that have been deemed urban. Since we have traditionally designated the urban and rural wage index as Tables 4a and 4b, as set forth in the addendum to this document, in the proposed rule, we designated this new county-specific set of wage index values as Table 4c.

Comment: We received a large number of comments suggesting that our proposal to implement section 1886(d)(8)(C) of the Act does not reflect the intent of Congress. Specifically, the commenters pointed out that in many counties whose hospitals were redesignated as urban under the provisions of section 1886(d)(8)(B) of the Act, our proposal to implement a county-specific wage index resulted in those hospitals receiving total prospective payments significantly lower than what they had received following implementation of section 1886(d)(8)(B) of the Act in FY 1989 because those hospitals would be subject to a lower wage index value. Many hospitals would have a wage index value lower than the Statewide rural wage index value. Commenters also noted that because of the low county-specific wage index value, in some cases, hospitals redesignated as urban would receive lower payments than when previously designated as rural. The commenters believe that Congress did not intend to reduce the wage index value applicable to these hospitals below what they had received when they were designated as rural hospitals.

The commenters offered several alternative approaches to rectify this situation. Some commenters suggested that the wage index value for hospitals in those counties redesignated as urban should not be allowed to fall below the Statewide rural wage index value. Alternatively, commenters suggested that the wage index value for these counties be calculated as the highest of the wage index value for the MSA to which they are deemed to belong, the county-specific wage index value, or the Statewide rural wage index value. Finally, other commenters suggested that we calculate the wage index value of the counties whose hospitals were deemed urban according to the provisions of section 1886(d)(8)(B) of the Act as added by section 4005(a) of Pub. L. 100–203, but calculate, the wage index values for the MSA and rural areas affected according to the provisions of section 1886(d)(8) of the Act as amended by section 8403(a) of Pub. L. 100–647. In this way, the hospitals deemed to be urban retain the benefit of a higher wage index value without affecting the values of the affected MSAs and rural areas. One commenter believes that we could use our general "exceptions and adjustments" authority in section 1886(d)(5)(C)(iii) of the Act to make any adjustment for the affected counties.

Reponse: Section 1886(d)(8)(C) of the Act is very specific as to how wage areas must be treated and does not give us discretion with regard to redesignated counties whose hospital wage index values are lower than the Statewide rural wage index value that would have applied to them absent this new provision. Given the specificity of the law, we believe this provision should be implemented as legislated by Congress.

With respect to Congressional intent, we find no evidence that Congress specifically intended to exempt from a county-specific wage index those redesignated counties whose hospitals have wage index values that are lower than the Statewide rural wage index value. The conference report notes only that the Secretary is expected to develop alternatives to minimize the impact of section 1886(d)(8)(C) of the Act on those hospitals, to be included in a report to Congress required under section 8403(b) of Pub. L. 100–647. (H.R. Rep No. 1104, 100th Cong., 2d Sess. 276 (1989).) If Congress had intended to exclude those counties from a county-specific wage index, we believe that the legislation would have been drafted accordingly.

With respect to the suggestion that the Secretary use the exceptions and adjustment authority as provided by section 1886(d)(5)(C)(iii) of the Act, we do not agree that it would be appropriate at this time to use this authority. Although we recognize that hospitals in certain counties will be disadvantaged by this provision during FY 1990 to the extent that they will receive a lower wage index value than if they had continued to be paid as rural hospitals subject to the Statewide rural wage index value, these same hospitals received the greatest increases in payments during FY 1989 when they were paid on the basis of the wage index of the MSA to which they were deemed under the provisions of section 1886(d)(8)(B) of the Act. It is clear that Congress was aware of the impact this provision would have on redesignated hospitals. As noted above, if Congress had intended a different application of this provision, we believe that the law would have provided for it. Therefore, we do not believe it would be appropriate to use our exceptions authority and that section 1886(d)(8)(C) of the Act should be implemented as written.

Comment: Several hospitals that are located in rural counties and are now deemed urban and, therefore, have their own county-specific wage index values, suggested that the new county-specific wage index values are lower than the Statewide rural area values because the wage data for their hospitals are incorrect.

Response: Any hospital that believes that there is an error in its 1984 wage data may request that we make a correction. However, before a correction is made, the hospital must provide adequate documentation supporting a data correction to its fiscal intermediary. After verifying the documentation, the intermediary will submit the request along with a recommendation to HCFA's central office. If the correction is appropriate, HCFA will notify the regional office of the revised wage index value to be implemented effective for discharges occurring on or after the date the regional office is notified of the change. In accordance with our longstanding policy, changes to the wage index are implemented on a prospective basis only. (See our discussion on this issue in the September 30, 1988 final rule (53 FR 38496).)

D. Future Updates to the Hospital Wage Index

Section 1886(d)(3)(E) of the Act (as amended by section 4004(a) of Pub. L. 100–203) requires that wage indexes that are applied to the labor-related portion of the national average standardized amounts of the prospective payment system be updated not later than October 1, 1990 and at least every 36 months thereafter. This section further provides that the Secretary base the update on a survey of the wages and wage-related costs of hospitals in the United States that participate in the prospective payment system. The survey must measure, to the extent feasible, the earnings and paid hours of employment by occupational category and must exclude data with respect to the wages and wage-related costs incurred in furnishing skilled nursing facility services.

To accomplish this task, we developed two wage index survey forms. The first form (Form A) requested data similar to past surveys, with a few noted exceptions. In addition to the total wages and hours collected in past surveys, Form A also asked for data relative to the salary and hours associated with direct patient-care contracted labor, home office, and fringe benefits. Form A excluded salary and hours associated with the skilled nursing facilities and other related cost centers. The second form (Form B), in addition to the data requested on Form A, requested data relative to several occupational categories.

Before initiating the new hospital wage survey, the proposed forms (A & B) were submitted for prior consultation to various hospital industry representatives, including the major hospital associations, as well as to the fiscal intermediaries. We solicited comments on both forms, including the feasibility of obtaining accurate data. The comments we received suggested that most hospitals would be unable to accurately provide data by occupational categories at this time. As a result of the comments on these two forms, we have modified Form A, now referred to as HCFA–2561.

The HCFA–2561 is currently being used to collect data for the FY 1991 update to the wage index as required by section 1886(d)(3)(E) of the Act. However, before implementing this updated wage index or reaching decisions in the future on the collection of data by occupational categories and incorporating future wage survey forms into the hospital cost report, we are interested in receiving input from the public. Therefore, in the proposed rule, we solicited comments on the following issues:

- Should the wage index include data on contracted labor? For purposes of the wage index survey, contracted labor has been defined as direct patient-care contract labor such as registry nurses. Should the definition be expanded to include contracted services indirectly related to patient-care, such as billing or housekeeping services?
- What portion, if any, of home-office salaries and hours should be added to the wages and hours incurred solely by the hospital?
- Which fringe benefits, if any, should be included in computing the wage index? How should they be valued?
- Would hospitals be capable of providing and identifying verifiable salaries and hours by occupational categories? What occupational groupings would be appropriate?
- If occupational data were collected, what formula or methodology should be used in calculating an occupational-mix index? How would the methodology reflect the varying personnel and hiring decisions made by hospitals, that is, one hospital may hire registered nurses for patient-care whereas another hospital in the same geographic area may employ licensed practical nurses instead?
- Should the HCFA–2561 be incorporated into the hospital report in order to obtain wage data on a regular basis? What level of hospital-specific wage data should be available to the public, including other hospitals? Can the occupational category data be retrieved by adding new schedules to the hospital cost report?

In order to give the public ample time to thoroughly evaluate the six issues listed above, we stated in the proposed rule that we will accept comments on these issues up to September 30, 1989. Comments on these six issues should be submitted to the following address:

Health Care Financing Administration, Office of Reimbursement Policy, Division of Hospital Payment Policy, Attn: Wage Index Issues, 1–H–1 East Low Rise, 6325 Security Boulevard, Baltimore, Maryland 21207.

Because of the extended time for public comment, we have not responded in this final rule to any comments received in response to the proposed rule concerning future updates to the wage index. We plan to respond to these comments in the proposed rule concerning the FY 1991 changes to the prospective payment system.

IV. Other Decisions and Changes to the Regulations

A. Annual Publication of Prospective Payment Rates (Section 412.8)

The September 1, 1983 final rule (47 FR 39819) added a provision to the regulations stating that when prospective payment rates are not published by September 1 before the beginning of the Federal fiscal year in which the rates would apply, the rates in effect on September 1 of the year in question will apply unchanged for the following Federal fiscal year. This provision in § 412.8(b)(4) has been superseded by changes to the statute.

Specifically, section 1886(b)(3)(B) of the Act, as amended by section 9109(b) of the Consolidated Omnibus Budget Reconciliation Act of 1985 (Pub. L. 99–272) and section 4002 of Pub. L. 100–203, specifies the update factors for prospective payment hospitals beginning in FY 1986 and each year thereafter. Because the law sets the rates for each Federal fiscal year, which are effective October 1 of each year, the provisions of § 412.8(b)(4) no longer conform to the law. Therefore, we proposed to delete this section.

Comment: We received a few comments regarding our proposal to delete the provision of § 412.8(b)(4) from the regulations. It was suggested that these regulations not be deleted but rather revised to state that in the event that revised prospective payment rates are not published by September 1, then the rates in the succeeding fiscal year will be the rates as of September 1, increased by the most recent hospital market basket forecast.

Response: We believe that it is unnecessary to include such a provision in the regulation. Section 1886(b)(3)(B) of the Act, as amended by section 9109(b) of Pub. L. 99–272 and section 4002 of Pub. L. 100–203, specifies the update factors for prospective payment hospitals, which for FY 1990 and each subsequent year is equal to the market basket percentage increase. Section 1886(b)(3)(B)(iii) of the Act defines the market basket percentage increase as the percentage, as estimated by the Secretary before the beginning of the applicable fiscal year, by which the cost of the mix of goods and services comprising routine, ancillary, and special care unit inpatient hospital services will exceed the cost of these goods and services for the preceding fiscal year.

We believe that we are required by the law to use the most recent hospital market basket forecast in making this estimate. In the absence of a published rate, the prospective payment rates will increase as of the succeeding fiscal year by an amount equal to the most recent forecasted increase in the hospital market basket, as prescribed by law.

In addition, since the update factors for prospective payment hospitals are set by law, the legislatively mandated factors would automatically be applied to the rates regardless of whether a notice was published timely. Given the fact that the update factors are subject to change annually based on recommendations submitted to Congress by the Department and ProPAC (sections 1886(e)(4) and 1886(e)(3)(A) of the Act, respectively), the market basket increase may not be the update factor prescribed by Congress for any given fiscal year. Therefore, since the law would take precedence over any regulations we may publish, we do not believe it is necessary to stipulate the update factor that would be applied to the rates if a notice of new rates is not published timely.

B. Burn Outliers (Section 412.84)

Section 4008(d)(1)(A) of Pub. L. 100–203 changed the marginal cost factor to 90 percent for day and cost outliers in DRGs related to burn cases. This provision was effective for discharges occurring on or after April 1, 1988 and expires as of October 1, 1989. We proposed to retain the marginal cost factor for cost outliers at 90 percent; however, we proposed to reduce the marginal cost factor for day outlier cases to 60 percent effective for discharges occurring on or after October 1, 1989 (that is, the same marginal cost factor as other DRGs). Therefore, we proposed to amend § 412.84 accordingly.

In the September 30, 1988 final rule (53 FR 38505), we indicated that ProPAC had issued a report that addressed outlier payments for burn cases and that we would review ProPAC's findings and recommendations to determine if changes in the burn outlier policy may be appropriate for FY 1990.

ProPAC's report indicated that increased outlier payments may only be appropriate for those cases treated in specialized burn centers and units. However, recognizing that no clear criteria currently exist to classify such centers, ProPAC postponed making specific recommendations pending further evaluation. While we recognize ProPAC's concern that outlier cases result in a more serious impact on specialized burn centers and units than to general hospitals treating burn cases, we generally do not believe it appropriate to create a new class of hospital (that is, burn hospitals and burn units) simply for purposes of targeting outlier payments.

As an interim measure, ProPAC recommended that burn cases be paid cost outliers only, based on a 90 percent marginal cost factor. In addition, ProPAC believes that the outlier payment pool for burn cases should be maintained at 19 percent of total payment for burn cases. This 19 percent figure represents the impact on burn outlier payments of increasing the marginal cost factor from 60 percent to 90 percent. ProPAC also recommended separate outlier thresholds for burn cases be established in order to maintain the 19 percent outlier payment pool.

While ProPAC's recommendation may target more burn outlier payments to specialized burn treatment centers, there is currently no statutory authority to eliminate day outlier payments. However, we agree that the 90 percent marginal cost factor may not be appropriate for less severe burn cases. Therefore, we believe it would be appropriate to reduce the marginal cost factor from 90 percent to 60 percent for day only outliers associated with burn cases since these generally represent less resource-intensive cases. Thus, as proposed, exceptionally costly day outliers, that is, those that meet both the day and cost outlier thresholds, would be paid the greater of 60 percent of the per diem Federal rate for each day beyond the length of stay threshold or 90 percent of the difference between adjusted charges and the cost thresholds.

Comment: Several commenters were concerned about our proposal to reduce the marginal cost factor for burn day outlier cases from 90 to 60 percent. One commenter stated that the reduction should be accomplished gradually over several years to give the affected hospitals time to adjust to the payment changes. Another commenter believes that lowering the marginal cost factor for day outliers to the same factor as all other day outliers reintroduces financial risk for hospitals that treat these cases and promotes the delivery of services in more costly settings. Also, this commenter states that the fact that HCFA is changing the policy so soon after its implementation (that is, April 1, 1988) violates the fundamental principle of the prospective payment system that the system is designed to assure hospital managers of predictability of rates and regulations.

Response: Our data show that specialized burn units generally receive more costly burn outliers cases that tend to be more resource intensive. General hospitals, on the other hand, mainly treat the less severe burn cases that may qualify as day outliers. We believe our proposed policy most closely achieves the policy goals of targeting outlier payments for the most costly burn cases, while at the same time maintaining outlier payments at approximately the same percentage of total payments for burn cases. We note that ProPAC supports this policy as an improvement over current law since it reduces the financial risk associated with treating burn cases at specialized centers.

With regard to the comment on violation of the principles of the prospective payment system, we note that the marginal cost factor for burn outliers was revised to 90 percent as of April 1, 1988 because we were required to do so by the provisions of section 4008(d)(1)(A) of Pub. L. 100–203. This provision expires as of October 1, 1989. Thus, we believe that a change in outlier policy for burn cases should have been anticipated by hospitals treating these cases. We are retaining the 90 percent factor for cost outliers. However, absent this policy, the marginal cost factor for both day and cost burn outliers would have reverted to the factor used for all other outliers, that is, 60 and 75 percent, respectively.

C. Payments to Sole Community Hospitals (Section 412–92)

Section 1886(d)(5)(C)(ii) of the Act provides special payment protections under the prospective payment system to sole community hospitals (SCHs). The statute defines an SCH as a hospital that, by reason of factors such as isolated location, weather conditions, travel conditions, or absence of other hospitals (as determined by the Secretary), is the sole source of inpatient hospital services reasonably available to Medicare beneficiaries. The regulations that set forth the criteria that a hospital must meet to be classified as an SCH are at § 412.92(a). To be classified as an SCH, a hospital must either have been designated as an SCH prior to the beginning of the prospective payment system or meet one of the following requirements:

- It must be located more than 50 miles from other like hospitals.
- It must be located between 25 and 50 miles from other hospitals, and it must—
  - —Serve at least 75 percent of inpatients in its service area;
  - —Be isolated by local topography or extreme weather conditions for one month of each year; or
  - —Have fewer than 50 beds and would qualify on the basis of market share except that some patients seek specialized care unavailable at the hospital.
- It must be located between 15 and 25 miles from other hospitals and isolated by local topography or extreme weather for one month of each year.

SCHs are paid a blended rate based on 75 percent of the hospital-specific rate and 25 percent of the Federal regional rate. An SCH is eligible for a payment adjustment if, for reasons beyond its control, it experiences a decline in volume of greater than five percent compared to its preceding cost reporting period. (This adjustment is also available to a hospital that could qualify as an SCH but chooses not to be paid as an SCH.) In addition, an SCH is eligible for an adjustment to its hospital-specific rate if it adds new services or facilities. SCHs are also exempt from the percentage reductions in reasonable cost payments for capital-related costs, as provided in section 1886(g)(3) of the Act.

In the September 30, 1988 final rule (53 FR 38513), we noted, in response to several ProPAC recommendations concerning SCHs, that our analysis of the SCH provisions is an on-going process. We also noted that we would continue to study whether our criteria are appropriate for determining which hospitals are the sole source of care for Medicare beneficiaries and whether sufficient protections are in place to assure beneficiary access to inpatient hospital services in rural areas.

Our analysis indicates that some SCHs would receive higher Medicare payments if they were to forego SCH status and be paid at the national rate. We believe those SCHs may be reluctant to give up their status because they may have difficulty requalifying if circumstances change to make SCH status more favorable in the future.

With this concern in mind, we proposed a revision to § 412.92(b)(4)(iii). That section currently states that if a hospital cancels its classification as an SCH, it may not apply for reclassification as an SCH unless all hospitals within 50 miles of it have closed. Because we believe this provision is restrictive and may prevent some existing SCHs from relinquishing their status even though it might be financially advantageous for them to do so, we proposed elimination of the hospital-closure-within-50-miles provision in § 412.92(b)(4)(iii). Instead, we proposed that, if a hospital cancels its status as an SCH, it may requalify for classification as an SCH only after 1 full year has passed since the cancellation was effective and only if the hospital meets the criteria for qualification that are in effect at the time it reapplies.

Section 1886(d)(5)(C)(ii) of the Act provides for reasonable compensation for significant increases in operating costs resulting from the addition of new services or facilities. Although a similar provision was originally proposed by regulation, Congress explicitly provided for the payment adjustment for new inpatient facilities or services in section 9111(a) of Pub. L. 99–272, which amended section 1886(d)(5)(C)(ii) of the Act. The payment adjustment was established effective with cost reporting periods beginning on or after October 1, 1983 and before October 1, 1989 as a temporary measure until a permanent payment methodology could be developed to recognize significant distortions in operating costs resulting from the addition of new services or facilities. The regulations implementing the payment adjustment are at § 412.92(g).

To date, there has been no legislative change to establish a different payment methodology to provide reasonable compensation for significant cost increases resulting from the addition of new services or facilities. In view of the expiration of the statutory provision explicitly providing for this payment adjustment, we proposed to extend indefinitely by regulation the provisions at § 412.92(g) in order not to disadvantage any SCH that experiences a significant increase in operating costs resulting from new inpatient services or facilities.

Currently, if a hospital wishes to receive a payment adjustment because it experienced a significant volume decrease, it must submit a request for the adjustment to its intermediary along with documentation demonstrating the size of the decrease in discharges and explaining the circumstances giving rise to the decline in discharges and how they were beyond the hospital's control. The hospital must also furnish evidence of the actions it took to control costs in the face of the circumstances cited and the resulting decline in discharges. The intermediary reviews and analyzes the documentation and then forwards the documentation along with its analysis and recommendation on approval to HCFA. HCFA determines the volume adjustment within 180 days from the date it receives the hospital's request and all other necessary information from the intermediary.

In an effort to streamline and expedite this process, we proposed that this determination process be decentralized and handled entirely by the intermediaries. We believe that there is now sufficient experience reviewing hospitals' applications for volume adjustments for intermediaries to make these determinations. We also proposed to revise § 412.92(e)(3) to make this change. We proposed that the intermediaries use the same criteria for review that are currently in place in § 412.92(e). For further discussion of this process, see the September 1, 1983 final rule (48 FR 39786), the June 10, 1987 proposed rule (52 FR 22090), and the September 30, 1987 final rule (53 FR 38510).

We are preparing manual instructions for the intermediaries concerning the determinations of volume adjustments. We proposed that any requests for a volume adjustment that intermediaries have not submitted to HCFA by

September 30, 1989 be processed for a final determination by the intermediaries.

With the deterioration in the financial condition of many rural hospitals, our ability to define appropriately those hospitals that represent the sole source of care reasonably available to Medicare beneficiaries has become increasingly important. In this regard, our criteria for SCH designation have remained largely unchanged since the beginning of the prospective payment system. The regulations reflect an assumption that any hospital located more than 50 miles from the nearest like hospital is the sole source of care reasonably available; conversely, it is assumed that a hospital located within 25 miles of a like hospital would not be the sole source of care reasonably available unless weather conditions make other hospitals inaccessible at least one month per year.

For hospitals located between 25 and 50 miles of another hospital, a market test or a measure of extremes in topography or weather conditions is used to determine whether the hospital qualifies for SCH designation. As clarified in the September 30, 1988 final rule (53 FR 38510), a hospital located between 25 and 50 miles of a like hospital may qualify as an SCH if, during the cost reporting period ending before it applies for SCH status, it admitted at least 75 percent of all the hospitalized residents or 75 percent of all the Medicare beneficiaries who were admitted to any like hospital located within the larger of the requesting hospital's service area or a 50 mile radius. A hospital's service area is the area from which a hospital draws at least 75 percent of its inpatients or a service area defined by a health systems agency. Thus, while a hospital located between 25 and 50 miles of the nearest like hospital cannot be presumed to be or not to be an SCH, it can demonstrate by the size of its market share that it serves as the sole source of inpatient services reasonably available. Also, if a hospital located between 25 and 50 miles of the nearest like hospital has fewer than 50 beds, it can be deemed to meet the market share criterion if its intermediary certifies that the hospital would have met this criterion were it not for the fact that some Medicare beneficiaries or residents of the hospital's service area were forced to seek care outside the service area due to the unavailability of certain specialty services at the hospital with fewer than 50 beds.

An analysis performed by Systemetrics under contract to ProPAC found that there is an interrelationship between the definition of market area and market share. Generally speaking, the more broadly a hospital's market area is defined, the lower the hospital's market share percentage will be. Further, the greater the distance to the nearest neighbor hospital, the more broadly the market area is defined. One result of the relationship between market share and distance to the nearest hospital is that only a small percentage of the hospitals located more than 50 miles from another hospital would meet the market test. Moreover, the proportion of facilities meeting the 75 percent market test is smaller for those 35 to 39 miles from their nearest neighbor than for those isolated by 25 to 34 miles.

We have concluded from our analysis of the Systemetrics data that the current market share test is inappropriate for hospitals that are located more than 35 miles from a like hospital. The market area for these hospitals, as currently defined, is sufficiently broad to make the 75 percent market share standard unreasonable. The Systemetrics data show only nine percent of hospitals between 35 and 49 miles from another hospital had a market share greater than 75 percent even though the estimated travel time between two hospitals located 35 miles apart would be 45 minutes on the average.

We considered modifying the SCH criteria for hospitals located 35 to 50 miles from a like hospital by narrowing the definition of market area or relaxing the 75 percent market share standard for these hospitals, or implementing both of these changes. We rejected this approach for several reasons. First, we believe that the SCH criteria are already too complicated and that increasing the complexity by adding unique criteria for hospitals located between 35 to 50 miles would be undesirable. Second, given the worsening financial condition of many rural hospitals, we do not believe it would be appropriate to delay changing the criteria until the analyses that would be needed to develop appropriate modifications in the market share test are completed. Finally, considering that the average travel time between two hospitals 35 miles apart is 45 minutes, we believe it is reasonable to assume that a hospital more than 35 miles from a like hospital is the sole source of care reasonably available to Medicare beneficiaries. Therefore, effective October 1, 1989, we proposed to modify our SCH criteria as set forth at § 412.92(a)(1) and (2) to eliminate the market share test for hospitals located more than 35 miles from a like hospital.

We also invited comment on how the SCH criteria might be improved or simplified. In this regard, we stated that we are continuing to analyze whether modifications should be made in the market share test for hospitals located between 25 to 35 miles from a like hospital.

We believe the Systemetrics data confirm the appropriateness of our standard that a hospital located within 25 miles of a like hospital would not be the sole source of care reasonably available unless topography or weather conditions make other hospitals inaccessible at least 1 month per year. The data show that only one percent of hospitals within 25 miles of another hospital provide at least 75 percent of the inpatient services received by Medicare beneficiaries residing within their service area. However, concern has been expressed regarding our criteria in § 412.92(a)(2) and (3), which define isolation of hospitals due to local topography or periods of prolonged severe weather. Under current policy, we require that a hospital must document its inaccessibility for 30 consecutive days in each of the past 3 years in order to qualify as an SCH on this basis (see 48 FR 39781, September 1, 1983). The documentation must be substantiated by an outside source, for example, the State Highway Department or a local public safety official.

In the proposed rule, we stated that we are also considering modifying this policy to require the hospital to document its inaccessibility for 30 nonconsecutive days in 2 out of the last 3 years. We also solicited comments regarding whether this standard would be appropriate.

Comment: Many commenters wrote concerning our suggested changes in the SCH qualifying criteria. All approved of our proposal to eliminate the market share test for hospitals more than 35 miles from the nearest hospital. However, many commenters offered various alternatives to our criteria as follows: One commenter suggested that we abolish the current criteria and reinstate the guidelines that were in effect prior to the implementation of the prospective payment system. Another commenter suggested that we abolish distance as a measure and rely solely on whether a hospital meets the 75 percent market share standard. One commenter believes that SCH status should be granted to a hospital if it provides services that are not available from any other hospital within a 35-mile radius while another believes that we should consider travel time instead of mileage in determining SCH status.

Response: While we appreciate all of the commenters suggestions, we do not believe we can implement any of them at this time. For reasons discussed in detail in the January 3, 1984, final rule (48 FR 271), we replaced the discretionary SCH criteria we used prior to the implementation of the prospective payment system with more objective numerical standards. The current standards incorporate the principles of the criteria that were in effect prior to the implementation of the prospective payment system while at the same time ensuring consistency in classifying hospitals as SCHs. Moreover, the market share test is an operational measure of the variables that influence patients in their decision to seek care at a particular hospital. That is, a hospital's market share will increase if travel or weather conditions curtail access to another hospital, or if physicians admit patients primarily to that particular hospital. If patients commonly use other hospitals for services, we conclude that those alternative hospitals are accessible to them, and that they are not limited to obtaining care at only one hospital.

We chose not to use physician admitting practices as a separate variable because they are included within market share. Physician admitting practices are a major determinant of market share, so using market share as a criteria does include consideration of physician admitting practices. Also, we chose not to use availability of public transportation as a separate criteria because it is included within the market share criteria, and because public mass transit systems are not a common method of transportation for patients receiving inpatient services.

In response to other commenters, we do not believe we should limit our review of SCH qualifications solely to travel time or to the provision of specialty services not available from any other hospital within a 35-mile radius. As we have noted previously, travel time as a measure is subject to many variables such as traffic congestion, road conditions, and time of day. For instance, what might be a 15-minute trip under ideal conditions could be a substantially longer trip on wet or snowy roads or in heavy traffic. Specific travel conditions would have to be defined and each hospital's application reviewed against these specific conditions in order to achieve consistency and equity in the decision process. Since such specific conditions would be extremely difficult to define and more difficult to measure objectively, we do not believe travel time is as valid a measure as road miles.

Neither do we believe that provision of specialty services not offered by any other hospital within 35 miles should be the sole measure of an SCH. Not only would "specialty" services have to be specifically defined, but measures of the need for and use of such services would have to be established. Furthermore, we do not believe the SCH provision was enacted to protect hospitals providing unique specialty services. Rather, we believe its intent was to ensure Medicare beneficiary access to care ordinarily found in general community hospitals.

With regard to the commenter who suggested that we drop mileage as a criterion and consider only whether the hospital treats at least 75 percent of the patients admitted to a hospital within its service area, we do not believe this suggestion is equitable. As we noted in the proposed rule (54 FR 19650), the data gathered by Systemetrics in its study of rural hospitals and SCH criteria show that the more isolated a hospital is, the greater the chance that it does not meet the 75 percent market share test. Thus, a large number of truly isolated hospitals could not qualify for SCH status. In addition, only 3.3 percent of all rural hospitals meet the 75 percent market share test (before adjustment for specialized care obtained outside the service area of rural hospitals with fewer than 50 beds). Thus, this commenter's suggestion could result in only 89 hospitals nationwide meeting the proposed standard. We do not believe that such a restrictive standard would protect Medicare beneficiaries' access to care or would be in the best interest of the rural hospitals.

Finally, although we are not implementing any of the commenters' suggestions at this time, we will keep them all in mind as we continue to review the SCH qualifying criteria in conjunction with the comments we received on beneficiary access to care in rural areas.

Comment: One commenter suggested numerous revisions to our qualifying criteria ranging from redefining the service area as the smaller of a 35-mile radius from the hospital or the area from which a hospital draws at least 50 percent of its patients. The commenter proposed that we lower the market share test from 75 percent to 60 percent and that we lower from 35 miles to 25 miles the distance from another hospital as the presumptive proof of SCH status. The stated goal of all of these revisions was not only to assure reasonable access for Medicare beneficiaries, but also to improve financial benefits to rural hospitals.

Response: We do not agree with the premise for the commenter's suggestions. All of them would liberalize the SCH provisions beyond what we believe was Congressional intent in establishing this provision. For instance, granting SCH status to any hospital more than 25 miles from any other hospital would mean that a beneficiary located between the two hospitals would be no more than 12.5 miles from a hospital; we do not believe such a short distance reflects an accessibility problem.

Redefining the service area as the commenter suggested would result in a significant increase in the number of rural hospitals qualifying as SCHs and would include some hospitals that we believe do not represent the sole source of care reasonably available to Medicare beneficiaries. If a significant portion of the residents in a hospital's service area seek care from other hospitals, this indicates that alternative sources of inpatient care are reasonably available.

Although we are not accepting any of the commenter's specific suggestions at this time, we have concluded that the geographic area considered in the market share test is too broad. Under current policy, a hospital may qualify as an SCH if it admitted at least 75 percent of all the hospitalized residents or 75 percent of all the Medicare beneficiaries who were admitted to any like hospitals located within the larger of the requesting hospital's service area or a 50-mile radius. Consistent with our decision to eliminate the market share test for hospitals located more than 35 miles from a like hospital, we are narrowing the geographic area to take into account admissions to like hospitals located within the larger of the requesting hospital's service area or a 35-mile radius. To implement this policy, we are revising § 412.92(a)(2)(i) and (b)(1)(ii)(B). Moreover, we will continue to analyze whether modification in the SCH definitions are needed to ensure reasonable access to care. However, to the extent that rural hospitals require financial assistance and protection from closure, we believe these objectives should be accomplished in alternative ways—not by so liberalizing the SCH criteria that a large percentage of the rural hospitals would qualify as SCHs. We acknowledged that we stated in the proposed rule (54 FR 19651) that the improvements we proposed in the SCH qualifying criteria were made in recognition of the difficulties facing rural hospitals; however, we believe there is a limit to the extent to which these difficulties should be resolved through the SCH provisions and even through the Medicare program.

We again acknowledge that we are keenly aware of the problems facing isolated rural hospitals and the potential consequences for Medicare beneficiaries should large numbers of these hospitals close. However, as we noted in the proposed rule as a part of our discussion on beneficiary access to care in rural areas (54 FR 19651), "A policy involving changes to the Medicare program alone would not be sufficient to assure essential access to rural health care. A viable and effective rural health care policy must involve Federal, State and local governments, and private insurers." As discussed below in section IV. D. of this preamble, we are continuing to receive comments solicited on this subject and will give all reasonable suggestions serious consideration.

Comment: Only two commenters responded to our proposal to liberalize the provision regarding road closing due to inaccessibility. Both favored our proposal, but believe it did not go far enough. That is, one commenter believes that the determination of accessibility should be arrived at by agreement between the State Highway Department and the hospital. The other commenter believes that while a highway department may consider a road passable, it might be highly inadvisable for a Medicare beneficiary to be driving on such roads.

Response: We are disappointed that our request for comment from interested parties did not generate greater response, and we appreciate the commenters who did address this issue. Neither, however, offered specific suggestions that can be implemented on a nationwide basis. We believe a determination of inaccessibility must be made by a disinterested party such as a State Highway Department and not by the affected hospital. This would be the only way to ensure consistency and impartiality.

Similarly, we agree that while it may be more difficult for aged Medicare beneficiaries to negotiate slippery roads, we do not know how this distinction can be made objectively. Differences in age and driving experience and skill are determining factors usually employed in deciding whether to attempt travel under difficult conditions. We know of no objective standards that can be implemented to measure such factors on an equitable basis. Therefore, we are not adopting the commenters' suggestions. However, we are modifying our policy to permit a hospital to qualify if it can demonstrate its inaccessibility for 30 nonconsecutive days in 2 out of the last 3 years before it applies. To clarify this point, we are revising § 412.92(a)(3).

Comment: All the comments we received on our proposal to transfer final processing of the SCH volume adjustment requests to the fiscal intermediaries were favorable. However, several commenters pointed out that we had not discussed hospital appeal rights following this transfer. They also urged HCFA review of the intermediary determinations to ensure timeliness, accuracy, and consistency. One commenter suggested that the current 180-day processing time be reduced to 90 days.

Response: We agree with the commenters' suggestions regarding appeal rights and HCFA oversight of intermediary determinations and we inadvertently neglected to mention these issues in our proposed rule.

Hospitals will retain the same appeal rights of intermediary determinations as they had of HCFA determinations. That is, if a hospital is dissatisfied with the intermediary's final determination, it may request a hearing before the provider Reimbursement Review Board as outlined at § 405.1836. Similarly, although we did not discuss in the proposed rule that we would maintain ongoing review of the intermediaries processing of hospitals' requests, these reviews will be conducted to ensure timeliness, accuracy, and consistency.

With regard to the commenter's suggestions that the alloted 180-day processing time for SCH applications be reduced from 180 to 90 days, we do not believe it is appropriate to impose such a short time frame on the intermediaries at this time. Certainly, we expect the intermediaries to process a hospital's request as rapidly as possible. However, we also recognize that because of other priorities and ongoing workloads, it may not always be possible for the intermediary to complete processing within a 90-day time frame. Therefore, while we are not adopting the commenter's suggestions, we are urging intermediaries to give these requests for volume adjustments a high priority and to process them as rapidly as possible.

Comment: Although we did not propose any changes in the payment methodology used to pay SCHs, we received three comments on this issue. One commenter pointed out that the current payment adjustment provides no incentive for a hospital to become an SCH. Two commenters stated that continuing to base SCH payments on the original base year costs does not adequately reflect current costs.

Response: We are aware that there are many hospitals that are entitled to the SCH adjustment but that have chosen not to apply for it because they receive greater payment under the prospective payment system using the fully national payment rates than they would as an SCH. However, as we have noted in the past, the current methodology is established by law. Therefore, we do not have the authority to alter this method.

We also recognize that, in some instances, it might be advantageous for a hospital to change its SCH status from time to time; that is, in some years, the national payment rates might be greater than the amount a hospital would receive as an SCH and, in other years, the opposite might be true. For this reason, we are relaxing the previous restriction on permitting a hospital to requalify for SCH status once it has relinquished its SCH designation.

Comment: One commenter requested that we clarify which qualifying criteria would be in effect if the criteria change between the time a hospital files for SCH status and the time a final determination is made on its application. The commenter also stated that if the later criteria are more favorable to the hospital, HCFA should permit the hospital to withdraw its application and refile it for consideration under the later criteria.

Response: Generally, a hospital's application will be considered using the criteria in effect at the time it submits its application to its intermediary. However, we agree with the commenter that if revisions to the regulations become effective prior to the HCFA regional office's issuing a final decision on the application, and if the hospital believes the revised criteria are more favorable to it or simplify its documentation requirements, the hospital may request that a determination be based on the later and more favorable criteria.

D. Beneficiary Access to Care in Rural Areas

The nation's rural health care system is undergoing a difficult period of transition in response to several complex factors including changing practice patterns, evolving delivery systems, regional economic change, facility conversion, declining admissions, patient mobility, and demographic change. These factors, coupled with the incentives for efficiency offered by Medicare's prospective payment system, present increasing pressures on the rural health care delivery system.

The challenge facing rural providers, State and local governments, Medicare, and other third-party insurers is to adopt policies that acknowledge the variety of factors affecting the long-term financial viability of rural providers and assure essential access to health care for rural residents.

As a long term initiative, we are evaluating whether refinements to the prospective payment system would be appropriate to improve our payment policy for rural hospitals. This evaluation includes—

- An assessment of whether the special payment protections for SCHs are adequate to provide beneficiaries with continued access to quality care;
- Examination of whether it would be appropriate to establish separate outlier thresholds for cases in urban and rural hospitals; and
- Research to replace the separate urban and rural rates with a single rate adjusted for severity and other factors that explain differential hospital cost experience.

Although we believe that it is important to implement appropriate Medicare payment policies for rural hospitals, we note that the critical issue facing the nation is assuring continued access to health care for all rural residents. Medicare payments account for 34 percent of rural hospitals' total revenues. Other revenue sources, such as Medicaid, private insurance, and self-pay, make up the remaining 66 percent of revenues. A policy involving changes to the Medicare program alone would not be sufficient to assure essential access to rural health care. A viable and effective rural health care policy must involve Federal, State and local governments, and private insurers.

To assist the Department in examining the many important issues affecting this principle of assuring "essential access", in the proposed rule, we requested comments on the following:

- How should the existing SCH policy be reformed and targeted to protect beneficiaries in rural areas with "essential access" problems?
- What are an appropriate operational definitions of "essential access" (for example, distance, market share, patient mobility, transportation, weather, or types of essential services provided)?
- What roles should Federal and State government play in identifying "essential access" facilities?
- Should the Federal government and States ensure that Medicaid payment policies acknowledge the need to assure "essential access" to care for beneficiaries in rural areas and, if so, how?
- Should States take actions to encourage third-party payors to acknowledge the need to assure "essential access" to care for rural residents?
- How can the rural transition grant program (authorized by section 4005(e) of Pub. L. 100–203) be targeted to specifically assist "essential access" facilities in planning, coordination, service delivery modification, and conversion efforts?
- How can the Fedral government best coordinate rural health policy with those of the State governments?

In order to give the public ample time to respond to the issues raised regarding "essential access" to health care by rural residents, the proposed rule stated that we would accept comments on these issues up to September 30, 1989. Comments on these issues should be submitted to the following address: Health Care Financing Administration, Office of Reimbursement Policy, Division of Hospital Payment Policy, Attn: Rural Access Issues, 1–H–1 East Low Rise, 6325 Security Boulevard, Baltimore, Maryland 21207.

As stated in the proposed rule, because these issues are not directly related to the Medicare prospective payment system, we are not responding to these comments in this final rule. However, we will take them into consideration as we develop a Departmental rural health policy designed to assure essential access to health care in rural areas.

E. Cancer Hospitals (Section 412.94)

Section 1886(d)(5)(C)(iii) of the Act authorizes special treatment for hospitals involved extensively in treatment for and research on cancer. In our regulations at § 412.94(a), we set forth the criteria a hospital must meet to be considered a cancer hospital. In § 412.94(b), we provide that, during its first cost reporting period subject to the prospective payment system, a qualifying cancer hospital may elect to be reimbursed on a reasonable cost basis, subject to the rate of increase limit. We have received inquiries concerning whether the provisions of sections 1815(e)(1) and 1886(g)(3) of the Act, which apply generally to prospective payment hospitals and not to hospitals excluded from the prospective payment system that receive payment on a reasonable cost basis, apply to these cancer hospitals since they are paid on a reasonable cost basis rather than on the basis of a prospective payment rate.

Section 1815(e)(1) of the Act provides that, effective with claims received on or after July 1, 1987, certain requesting prospective payment hospitals will receive payment for Medicare services on a periodic interim payment (PIP) basis. Under PIP, payment is based on the estimated annual payments for care provided to Medicare patients, and equal biweekly payments are made to hospitals without regard to the submission of individual bills. However, an end-of-year settlement in made once all bills for the year have been submitted and processed. Generally, under the provisions of section 1815(e)(1) of the Act and the regulations that implement it, § 412.116, an otherwise qualifying prospective payment hospital receives PIP only if its intermediary fails to make prompt payment of the hospital's bills, or if the hospital previously qualified as a hospital serving a disproportionate share of low-income patients or as a small rural hospital. Hospitals that are not "subsection (d) hospitals," as well as other providers such as skilled nursing facilities and home health agencies, continue to be eligible for PIP if they meet the other qualifying conditions.

Section 1886(g)(3) of the Act requires, effective October 1, 1986, specified reductions in the amount of payment for capital-related costs of inpatient hospital services of all prospective payment hospitals except sole community hospitals. This provision is set forth in regulation at § 412.113.

Except for sole community hospitals as provided in section 1886(g)(3)(B) of the Act, sections 1815(e)(1) and 1886(g)(3) of the Act apply to all subsection (d) hospitals and subsection (d) Puerto Rico hospitals (as defined in sections 1886(d) (1)(B) and (9)(A) of the Act, respectively). The authority in section 1886(d)(5)(C)(iii) of the Act that permits special treatment under the prospective payment system for a cancer hospital does not alter that hospital's status as a subsection (d) hospital (that is, a prospective payment hospital). Therefore, there is no legislative authority for exempting cancer hospitals from the provisions of sections 1815(e)(1) and 1886(g)(3) of the Act merely because they are paid on the same basis as hospitals excluded from the prospective payment system (that is, on a reasonable cost basis).

We have recently advised the HCFA regional offices to direct fiscal intermediaries that have not already done so to begin applying the provisions of §§ 412.113 and 412.116 to cancer hospitals receiving payments under § 412.94. The intermediaries were directed to apply the provisions of §412.113 retroactively, beginning with

portions of cost reporting periods occurring during FY 1987 as required by section 1886(g)(3) of the Act. However, the provisions of § 412.116 can not be applied retroactively due to the nature of PIP. Therefore, we directed the intermediaries to terminate current PIP payments to cancer hospitals that do not qualify to receive PIP under the provisions of § 412.116(b)(1) (i), (ii), or (iii). As with other prospective payment hospitals that no longer receive PIP, these cancer hospitals that have their PIP payments terminated will receive payments for inpatient operating costs related to care of Medicare patients on the basis of submitted bills rather than receiving equal biweekly payments.

Accordingly, we proposed to revise § 412.94(b) to clarify that cancer hospitals receiving payment on a reasonable cost basis retain their status as subsection (d) hospitals and are subject to all other regulations governing hospitals subject to the prospective payment system.

Comment: One commenter believes that Congress' intent was to remove PIP and to reduce capital payments only for hospitals subject to the prospective payment system and that such application was not intended to apply to cancer hospitals that qualify for reasonable cost reimbursement under the provisions of § 412.94. The commenter also noted that most Medicare intermediaries continued PIP and unreduced capital payments to the eight cancer hospitals that qualify for reasonable cost reimbursement and that such action is consistent with the intent of Congress.

Several commenters recognized that our clarification of the regulations at § 412.94 is consistent with the statute. However, they recommended that any cancer hospitals currently receiving PIP should continue to receive PIP. The commenters believe that continuation of PIP would prevent operational disruptions in these hospitals and, given the small number of cancer hospitals, would have only a minimal cost impact on the Medicare program.

Finally, one commenter requested that the preamble address whether qualifying cancer hospitals are exempt from the methodology regarding private room differential and from reasonable compensation equivalent (RCE) limits on physician Part A services, computations that are applicable to hospitals subject to the rate of increase limits under section 1886 (a) and (b) of the Act but not to hospitals paid under the prospective payment system.

Response: We believe, as some commenters agreed, that the statute requires application of the PIP provision and capital reduction provision applicable to prospective payment hospitals to qualifying cancer hospitals since they are also prospective payment hospitals. Therefore, we are required to apply these provisions to cancer hospitals. We believe that we cannot grant an exception to these provisions for the subject cancer hospitals, including, with regard to the PIP provision, cancer hospitals currently receiving PIP. The fact that some intermediaries did not properly apply the PIP and capital reduction provisions to the cancer hospitals is the reason that we are clarifying the regulation.

Section 412.94(b)(1) provides that qualifying cancer hospitals are to be paid on a reasonable cost basis under 42 CFR part 413. The methodology regarding the private room cost differential is set forth in § 413.53. Therefore, the regulations regarding the private room cost differential are applicable to cancer hospitals paid under reasonable cost reimbursement. The RCE limits are included in the regulations at § 405.482. Although the RCE limits are not included in part 413, they are an integral part of the applicable reasonable cost regulations. The latter regulations were formerly codified as subpart D of Part 405. When the prospective payment regulations now in Part 412 were recodified on March 29, 1985, all the reasonable cost regulations, including the RCE limits, were in subpart D. When the reasonable cost regulations were recodified as part 413 on September 30, 1986, certain regulations pertaining to teaching hospitals and provider-based physicians were not so recodified but remained in subpart D. However, the reference to the reasonable cost regulations in § 412.94 was changed from "subpart D of part 405" to "part 413". (See 51 FR 34793 (September 30, 1986).) Although not all the reasonable cost regulations were included in this new designation as they had been by the former designation, there was no intent to change their applicability. As we stated at the time, "In no instance do we intend any of the amendments to affect the substance of the Medicare rules." (51 FR 34790.) Thus, the applicability of the RCE limits to cancer hospitals did not change. They remain an integral part of determining payment for physican Part A services to a hospital that is paid on a reasonable cost basis. For § 412.94 cancer hospitals, payment is made under the reasonable cost regulations in part 413 and elsewhere and not under the prospective payment provisions of part 412. Therefore, these limits are applicable in determining the reasonable cost reimbursement for cancer hospitals. We have revised § 412.94(b)(1) to refer to the reasonable cost provisions of both subparts D and E of part 405.

F. Rural Referral Centers (Section 412.96)

Under the authority of section 1886(d)(5)(C)(i) of the Act, § 412.96 sets forth the criteria a hospital must meet in order to receive special treatment under the prospective payment system as a referral center (that is, payment is based on the other urban payment rate rather than the rural payment rate), One of the criteria under which a rural hospital may qualify as a referral center is to have 275 or more beds available for use.

A rural hospital that does not meet the bed size criterion can qualify as a rural referral center if the hospital meets two mandatory criteria (number of discharges and case-mix index) and at least one of three optional criteria (medical staff, source of inpatients, or volume of referrals). With respect to the two mandatory criteria, currently a hospital is classified as a rural referral center if its—

- Case-mix index is equal to the lower of the median case-mix index for urban hospitals in its census region, excluding hospitals with approved teaching programs, or the median case-mix index for all urban hospitals nationally; and
- Number of discharges is at least 5,000 discharges per year or, if fewer, the median number of discharges for urban hospitals in the census region in which the hospital is located. (We note that the number of discharges criterion for an osteopathic hospital is at least 3,000 discharges per year.)

1. Case-Mix Index

Section 412.96(c)(1) provides that HCFA will establish updated national and regional case-mix index values in each year's annual notice of prospective payment rates for purposes of determining referral center status. In determining the proposed national and regional case-mix index values, we followed the same methodology we used in the November 24, 1986 final rule, as set forth in regulations at § 412.96(c)(1)(ii). Therefore, the proposed national case-mix index value includes all urban hospitals nationwide and the proposed regional values are the median values of urban hospitals within each census region, excluding those with approved teaching programs (that is, those hospitals receiving indirect medical education payments as provided in § 412.118).

These values are based on discharges occurring during FY 1988 (October 1,

BEST COPY AVAILABLE

1987 through September 30, 1988) and include bills posted to HCFA's records through December 1988. Therefore, in addition to meeting other criteria, we proposed that to qualify for or to retain rural referral center status for cost reporting periods beginning on or after October 1, 1989, a hospital's case-mix index value for FY 1988 would have to be at least—

- 1.2187; or
- Equal to the median case-mix index value for urban hospitals (excluding hospitals with approved teaching programs as identified in § 412.118) calculated by HCFA for the census region in which the hospital is located as indicated in the table below.

	Region	Case-mix index value
1.	New England (CT, ME, MA, NH, RI, VT)	1.1596
2.	Middle Atlantic (PA, NJ, NY)	1.1596
3.	South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	1.2107
4.	East North Central (IL, IN, MI, OH, WI)	1.1644
5.	East South Central (AL, KY, MS, TN,)	1.1598
6.	West North Central (IA, KS, MN, MO, NB, ND, SD)	1.1742
7.	West South Central (AR, LA, OK, TX)	1.2082
8.	Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	1.2379
9.	Pacific (AK, CA, HI, OR, WA)	1.2272

Based on the latest data available (through June 1989), the final national case-mix index value is 1.2205 and the median case-mix index values by region are set forth in the table below.

	Region	Case-mix index value
1.	New England (CT, ME, MA, NH, RI, VT)	1.1681
2.	Middle Atlantic (PA, NJ, NY)	1.1591
3.	South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	1.2122
4.	East North Central (IL, IN, MI, OH, WI)	1.1555
5.	East South Central (AL, KY, MS, TN)	1.1615
6.	West North Central (IA, KS, MN, MO, NB, ND, SD)	1.1741
7.	West South Central (AR, LA, OK, TX)	1.2094
8.	Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	1.2402
9.	Pacific (AK, CA, HI, OR, WA)	1.2432

For the benefit of hospitals seeking to qualify as referral centers or those wishing to know how their case-mix index value compares to the criteria, we are publishing the FY 1988 case-mix index values in Table 3c in section IV of the addendum to this final rule. In keeping with our policy on discharges, these case-mix index values are computed based on all Medicare patient discharges subject to DRG-based payment.

2. Discharges

Section 412.96(c)(2)(i) provides that HCFA will set forth the national and regional numbers of discharges in each year's annual notice of prospective payment rates for purposes of determining referral center status. As specified in section 1886(d)(5)(C)(i)(II) of the Act, the national standard is set at 5,000 discharges. However, we proposed to update the regional standards, which are based on discharges for urban hospitals during the fourth year of the prospective payment system (that is, October 1, 1986 through September 30, 1987), which is the latest year for which we have complete discharge data available.

Therefore, in addition to meeting other criteria, we proposed that to qualify for or to retain rural referral center status for cost reporting periods beginning on or after October 1, 1989, a hospital's number of discharges for its cost reporting period that began during FY 1988 would have to be at least—

- 5,000; or
- Equal to the median number of discharges for urban hospitals in the census region in which the hospital is located as indicated in the table below.

	Region	Number of discharges
1.	New England (CT, ME, MA, NH, RI, VT)	6749
2.	Middle Atlantic (PA, NJ, NY)	8138
3.	South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	6451
4.	East North Central (IL, IN, MI, OH, WI)	7850
5.	East South Central (AL, KY, MS, TN)	6113
6.	West North Central (IA, KS, MN, MO, NB, ND, SD)	5832
7.	West South Central (AR, LA, OK, TX)	4526
8.	Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	7403
9.	Pacific (AK, CA, HI, OR, WA)	4927

Based on the latest discharge data available, the final median number of discharges by census region are set forth in the table below.

	Region	Number of discharges
1.	New England (CT, ME, MA, NH, RI, VT)	6599
2.	Middle Atlantic (PA, NJ, NY)	7750

We again note that to qualify for or to retain rural referral center status for cost reporting periods beginning on or after October 1, 1989, an osteopathic hospital's number of discharges for its cost reporting period that began during FY 1988 would have to be at least 3,000.

3. Retention of Referral Center Status

In the August 31, 1984 final rule, we announced that we were instituting a periodic review of the status of hospitals that qualified for a payment adjustment as referral centers (49 FR 34746). That final rule stated that this review would allow us to determine if these hospitals continued to meet the criteria for referral center status. The final rule stated that we would grant referral center status to a hospital for a 3-year period. At the end of the 3 years, we would evaluate a hospital's performance in meeting the criteria for qualifying as a referral center. A hospital would have been required to meet the criteria for at least 2 of those 3 years. If it did, the hospital would retain its referral center status for another 3-year period. If the hospital did not meet the criteria for at least 2 of the 3 years, the hospital's status as a referral center would end with the last day of the third cost reporting period for which it received the referral center payment adjustment.

Before we were able to implement this review, the Omnibus Budget Reconciliation Act of 1986 (Pub. L. 99–509) was enacted on October 21, 1986. Section 9302(d)(2) of Pub. L. 99–509 stated that any hospital that was classified as a rural referral center on the date of the enactment of that law will continue to be classified as a referral center for cost reporting periods beginning on or after October 1, 1986 and before October 1, 1989. Thus, any hospital that was classified as a referral center as of October 21, 1986 (the date of enactment of Pub. L. 99–509) is guaranteed this status through its cost reporting period beginning before October 1, 1989

We believe it is important that the rural referral center benefit be available only to those hospitals that continue to be in compliance with the statutory criteria for designation. Therefore, with the expiration of the requirement of section 9302(d)(2) of Pub. L. 99–509 on October 1, 1989, we proposed to implement essentially the same retention criteria and methodology specified in § 412.96(f) that we had developed prior to the enactment of Pub. L. 99–509 with one variation. These previous criteria and methodology were discussed in the June 10, 1985 proposed rule (50 FR 24380) and the September 3, 1985 final rule (50 FR 35676).

Basically, to retain status as a referral center, a hospital must meet the criteria for classification as a referral center specified in § 412.96(b) or (c) for at least 2 of the 3 years after it qualifies as a referral center or it must qualify on the basis of the requirements for the current year. A hospital may meet the specific criteria in either paragraph for individual years during the 3-year period or the current year. For example, a hospital may meet the two mandatory requirements in § 412.96(c)(1) (case-mix index) and (c)(2) (number of discharges) and the optional criterion in paragraph (c)(3) (medical staff) during the first year. During the second and third year, the hospital may meet the criteria under § 412.96(b)(1) (rural location and appropriate bed size).

A hospital must meet all of the criteria within any section of the regulations in order to meet the retention criteria for a given year. That is, it must meet all of the criteria of § 412.96(b)(1) or § 412.96(b)(2) or § 412.96(c). For example, if a hospital meets the case-mix index standards in § 412.96(b)(2) in years 1 and 3 and the number of discharge standards in years 2 and 3, it would not meet the retention criteria. All of the standards must be met in the same year.

When we begin implementation of the provisions of § 412.96(f), some hospitals will have been classified as referral centers for more than 3 years without having been reviewed for continuing compliance with the referral center criteria. We proposed that the review process be limited to the hospital's compliance during the last 3 years. Thus, if a hospital meets the criteria for at least 2 of the last 3 years or for the current year, it would retain its status for another 3 years. No hospital would be subject to a review until the end of its third full cost reporting period as a referral center. Therefore, those hospitals that first qualified as referral centers as of April 1, 1988 by virtue of having at lest 275 beds will not be subject to review until the end of their their full cost reporting period as a referral center.

In the past few years, there have been several changes in the methodology used to set the case-mix index and the number of discharges criteria. We have constructed the following chart and example to aid hospitals that qualify as referral centers under the criteria in § 412.96(c) in projecting whether they will retain their status as a referral center.

Under § 412.96(f), to qualify for a 3-year extension effective with cost reporting periods beginning in FY 1990, a hospital must meet the mandatory criteria in § 412.96(c) for FY 1990 or it must meet the criteria for 2 of the last 3 years as follows.

For the cost reporting period beginning during FY	Use hospital's case-mix index for FY	Use the discharges for the hospital's cost reporting period beginning during FY	Use numerical standards as published in the Federal Register on
1990	1988	1988	Sept. 1, 1989.
1989	1987	1987	Sept. 30, 1988.
1988	1986	1986	Sept. 1, 1987.
1987	1985	1985	Nov. 24, 1986 and Aug. 24, 1987.

Example: A hospital with a cost reporting period beginning July 1 qualified as a referral center effective July 1, 1985. The hospital has fewer than 275 beds. Its status as a referral center is protected through the end of its cost reporting period beginning July 1, 1989. To determine if the hospital should retain its status as a referral center for an additional 3-year period, we would review its compliance with the applicable criteria for its cost reporting periods beginning July 1, 1987, July 1, 1988, July 1, 1989, and July 1, 1990. The hospital must meet the criteria either for its cost reporting beginning July 1, 1990 or for two out of the three past periods. For example, to be found to have met the criteria at § 412.96(c)(2) for its cost reporting period beginning July 1, 1988, the hospital's case-mix index value during FY 1986 must have equaled or exceeded the lower of the national or the appropriate regional standard as published in the September 1, 1987 final rule. The hospital's total number of discharges during its cost reporting year beginning July 1, 1986 must have equaled or exceeded 5000 or the regional standard as published in the September 1, 1987 final rule.

For those hospitals that seek to retain referral center status by meeting the criteria of § 412.96(b)(1) and (b)(1)(ii) (that is, rural location and appropriate bed size (500 or more beds for discharges occurring before April 1, 1988 and 275 or more beds thereafter)), we would look at the number of beds shown for indirect medical education purposes (as defined at § 412.118(b)) on the hospital's cost report for the appropriate year. As discussed above, we would consider only full cost reporting periods beginning on or after April 1, 1988 when determining a hospital's status under § 412.96(b)(1)(ii). This definition varies from the bed size criterion used to determine a hospital's initial status as a referral center because we believe it is important for a hospital to demonstrate that it has maintained at least 275 beds throughout its entire cost reporting period, not just for a particular portion of the year.

In the proposed rule, we projected that 25 percent of hospitals currently designated as rural referral centers will not meet the retention criteria. We are revising this figure to 19 percent based on more current data. Our projection is based on comparison of the existing rural referral centers' actual case-mix index values and number of discharges to the lower of the national or regional standards for the applicable years. Approximately 80 percent of the hospitals we project will not retain their status did not meet the proposed case-mix index criterion for qualifying as a rural referral center in FY 1990; based on MEDPAR data processed through December 31, 1988, the average case-mix index value for the hospitals not meeting the case-mix index criterion is six percent lower than the applicable criterion. Approximately 40 percent of the hospitals that we project will not retain status failed to meet the discharge standards. Twenty-five percent met neither the discharge nor the case-mix index criterion for FY 1990 or for 2 out of the last 3 years.

We received many comments concerning the various aspects of payment to rural referral centers. These comments and our response follow.

Comment: Several commenters suggested revisions in the manner in which we set the national and regional case-mix index criteria. That is, some believed that the case-mix index criteria should be based on the mean case-mix index of urban hospitals rather than on the median which we now use. One commenter suggested that we establish a hospital's average case-mix index value over a 3-year period and compare it to the average case-mix index value of urban hospitals for the same 3-year period. One commenter suggested that we develop "proper" case-mix index criteria, but did not elaborate further. Finally, one commenter stated that establishing the case-mix index criterion standards at the median was unfair since it means that a rural hospital must maintain a case-mix index value higher than 50 percent of all urban hospitals.

Response: Section 9302(d)(1) of the Omnibus Budget Reconciliation Act of 1986 (Pub. L. 99–509) amended section 1886(d)(5)(C)(i) of the Act to statutorily establish case-mix index, annual number of discharges, and "any other criteria established by the Secretary" as one method under which a rural hospital can qualify as a rural referral center. Section 1886(d)(5)(C)(i)(II) of the Act specifically requires that a rural hospital have "a case mix equal to or greater than the *median* case mix for hospitals (other than hospitals with approved teaching programs) located in an urban area in the same region * * *" (emphasis added). Thus, we believe we are prohibited by law from implementing any of the suggestions offered.

We believe the current methodology is an equitable measure of the complexity of the cases treated by a hospital. As we have noted in previous discussions, Congress intended that the rural referral center adjustment be granted only to large facilities that treat "patients who require an intensity of resources beyond the capabilities of general community hospitals." (120 Cong. Rec. S3224–3226 (daily ed. March 17, 1983).) Congress also described referral centers as "large, technologically sophisticated hospitals * * * which are characterized by high case mix indices, diverse geographical patient origin, and numerous multidisciplinary medical education programs." (129 Cong. Rec. S3224–3226 (daily ed. March 17, 1983).) Thus, we believe Congress intended that qualification as a rural referral center be limited to those rural hospitals that can demonstrate through maintenance of high case-mix index values that they are truly providing highly specialized and intensive care.

In addition to the fact that the law requires that we establish the qualifying standards using the median case-mix index value of urban hospitals, we also believe the median is the appropriate measure. Means can be skewed by extremes either at the upper or lower ends. The median is less likely to be significantly altered by such extremes.

Finally, section 1886(d)(5)(C)(i)(I) of the Act, as originally added by section 2311(a) of the Deficit Reduction Act 1984 (Pub. L. 98–369), specifically states that certain operating characteristics of rural referral centers should be similar to those of a typical urban hospital located in the same census region. We believe the median more accurately reflects the typical urban hospital than would the mean. For these reasons, we do not believe it is unreasonable to expect rural hospitals seeking rural referral center status to meet a standard that exceeds that of 50 percent of the urban hospitals.

Comment: Although we did receive one favorable comment, many commenters disagreed with our proposal to implement triennial reviews of approved rural referral centers. Commenters' alternative suggestions to our proposal included extension of the grandfathering provision for 3 to 5 years, eliminating the reviews altogether, or delaying implementation of the review until proposed legislation that would extend the grandfathering provision has been acted upon.

Response: We continue to believe that it is equitable and reasonable to review periodically approved rural referral centers' compliance with the criteria in the statute and regulations to ensure that only those hospitals that are truly functioning as rural referral centers receive the special adjustment. Some hospitals qualified as rural referral centers based on their case-mix index values and number of discharges from 1981 and have not met the criteria since that time. We do not believe it is fair to the remaining rural hospitals to continue to recognize these hospitals as rural referral centers. Thus, we do not agree with the commenters who suggested either not doing the reviews at all or delaying them for several years.

We have compared data from the two groups of rural referral centers (those projected to retain their status and those projected to lose their status) to rural hospitals that are not referral centers and to hospitals located in other urban areas. These data show that the hospitals projected to retain referral center status do, in fact, bear a marked similarity to hospitals in other urban areas in comparison of both case-mix index values and numbers of discharges. Similarly, the statistics of rural referral centers projected to lose their status more closely resemble those of all other rural hospitals. For example, the rural hospitals retaining referral center status had an average case-mix index value of 1.2289 compared to an average case-mix index value of 1.2753 for hospitals in other urban areas; discharges averaged 8,165 and 8,009, respectively. The rural referral centers projected to lose their status had an average case-mix index value of 1.1275 and discharges of 5,412, which, while above the averages of 1.0739 and 1,753 for all other rural hospitals, are still enough lower than the statistics of other urban hospitals to illustrate their dissimilarity. In addition, we compared the FY 1987 average cost per case of rural referral centers projected to retain their status ($3,192) to the average cost per case of other urban hospitals ($3,967). The average cost per case for the referral centers projected to lose their status was $2,898 while that of all other rural hospitals was $2,462.

We believe that all of these data demonstrate that those rural referral centers that we project will lose their status more closely resemble other rural hospitals than they do other urban hospitals. We believe these data support reimplementation of the periodic reviews of rural referral center and the retention of only those hospitals that continue to meet the qualifying critiera.

With regard to proposed legislation that would extend the grandfathering provision, we cannot set policy or delay implementing regulatory provisions based on pending legislation that may be enacted in any one of several forms or may not be enacted at all. If legislation that has an impact on our policy concerning rural referral centers if enacted, we will comply with it as rapidly as possible.

Comment: One commenter suggested that the criteria to retain rural referral center status should be limited to case-mix index and referrals only and should not include number of discharges. Another commenter stated that the 5,000 national discharge standard that must be met to qualify for rural referral status is arbitrary and irrelevant in view of declining hospital utilization. A third commenter requested that we publish the specific number of Medicare discharges by hospital as we do case-mix index values, so that these numbers can be reviewed for accuracy.

Response: As noted above, section 1886(d)(5)(C)(i)(II) of the Act requires that we consider a rural hospital's annual number of total discharges along with its case-mix index value (as well as optional criteria as determined by the Secretary) in classifying rural hospitals as rural referral centers under this section. Specifically, that section of the Act requires that a hospital have "at least 5,000 discharges a year or, if less, the median number of discharges in urban hospitals in the region in which the hospital is located . . ." (We note that this section also provides that rural osteopathic hospitals must have 3,000 annual discharges.)

Thus, the fact that a hospital must maintain a specific number of discharges annually is not only a

statutory requirement, but the national level of 5,000 is also set by law, as is the requirement that the regional standards must be determined based on the median number of discharged from urban hospital in the same census region. Therefore, we do not have the authority to eliminate discharges as a standard or to alter the national number required. In addition, we believe it is reasonable to require a hospital to meet the same standards to retain rural referral center status as must be met to acquire that status during any given year.

It should also be noted that the 5,000 discharges standard is lower than the median number of discharges from eight of the nine census regions. In some regions, it is significantly lower (by more than 2,750 discharges annually in census region 2). In addition, data taken from hospital cost reports for cost reporting periods beginning during FYs 1987 and 1988 show that, on a national basis, although the median number of discharges from rural hospitals declined from 1,451 in 1987 to 1,403 in 1988, the median number of discharges from urban hospitals actually increased from 6,314 in 1987 to 6,335 in 1988. In view of these statistics, we believe the 5,000 total discharges standard is quite reasonable. Therefore, we are not adopting the commenters' suggestions.

Regarding the suggestion that we publish the annual number of Medicare discharges for verification purposes, we are uncertain how such information would benefit hospitals seeking rural referral center status. A hospital's total annual discharges are considered in determining its qualification as a rural referral center—not just its Medicare discharges. That number is obtained from the hospital's cost report for the appropriate year; the number of Medicare discharges is not a consideration in determining rural referral center status.

Although annual Medicare discharges may be obtained from central office records, we do not believe the number alone is of significance for hospitals in determining rural referral center status. In addition, since, for purposes of qualifying as a rural referral center, a hospital's discharges are determined based on each hospital's cost reporting year, it would be an administrative expense for HCFA to provide Medicare discharge information based on each hospital's cost reporting period. Therefore, we are not adopting the commenter's suggestion.

Comment: We received one comment suggesting that since the change in the rural referral center policy will have an impact on payments to hospitals, it should be implemented in a budget-neutral fashion.

Response: It has not been our practice to make budget neutrality adjustments to reflect increases or decreases in aggregate payments due to changes in hospital status for special payment provisions except when we have been required to do so by the statute. For example, although we made a budget neutrality adjustment as required by section 9302(d)(3) of Pub. L. 99–509 when the rural referral center case-mix index criterion was revised to exclude teaching hospitals effective for cost reporting periods beginning on or after October 1, 1986, we did not make subsequent adjustments to the payment rates for additional payments made to newly qualifying referral centers after that date and before the bed-size criterion was lowered effective April 1, 1988 by section 1886(d)(5)(C)(i)(I) of the Act. Therefore, we do not believe we should adjust the rates when hospitals no longer qualify. We have also taken this position for disproportionate share hospitals which must qualify annually for additional payments under the disproportionate share hospital provision.

Moreover, we believe a budget neutrality adjustment would be premature. Our projection of how many hospitals will not retain referral center status is based on available information; for example, we have used FY 1987 discharges in our estimate. We will not actually know how many hospitals lose their rural referral center status until the retention status determination is made by the Regional Office. This determination will include consideration of the hospitals' FY 1988 discharges. Also, affected hospitals will not lose their rural referral center status until the beginning of their next cost reporting period, which in many cases will be well into the next Federal fiscal year.

G. Disproportionate Share Adjustment (Section 412.106)

Section 8401 of Pub. L. 100–647 amended section 1886(d)(5)(F)(i) of the Act to extend payment of the disproportionate share adjustment through discharges that occur before October 1, 1995. Prior to enactment of Pub. L. 100–203, the payment adjustment for disproportionate share hospitals was to be made only through discharges occurring before October 1, 1990. We proposed to revise § 412.106(b)(1) and (b)(2) to conform our regulations with this statutory provision. We received no comments on this provision. Therefore, we are adopting our changes as proposed. However, we are taking this opportunity to clarify the regulations at § 412.106, which deal with the adjustment for disproportionate share hospitals. These revisions are not intended to revise the regulations (except for the change required by section 1886(d)(5)(F)(i) of the Act described above), but are merely designed to make the regulations easier to read and understand.

H. Indirect Medical Education Costs (Section 412.118)

Section 1886(d)(5)(B) of the Act provides that prospective payment hospitals that operate medical education programs receive an additional payment for the indirect costs of medical education. The regulations governing the calculation of this additional payment are set forth at § 412.118. Each hospital's additional indirect medical education payment is determined by multiplying the hospital's total DRG revenue by the applicable education adjustment factor.

Section 4003(a) of Pub. L. 100–203 revised section 1886(d)(5)(B)(ii) of the Act to reduce the education adjustment factor used to determine the indirect medical education payment for approximately 8.1 percent to approximately 7.7 percent for discharges occurring on or after October 1, 1988 and before October 1, 1990. Section 8401 of Pub. L. 100–647 extended the applicability of this education adjustment factor through discharges occurring before October 1, 1995. We note that the education adjustment factor is an approximation because the adjustment factor is applied on a curvilinear or variable basis. An adjustment made on a curvilinear basis reflects a nonlinear cost relationship; that is, each absolute increment in a hospital's ratio of interns and residents to beds does not result in an equal proportional increase in costs.

For discharges occurring on or after October 1, 1988 and before October 1, 1995, the indirect medical education factor equals the following:

$$1.89 \times \left[\left(1 + \frac{\text{interns and residents}}{\text{beds}}\right)^{.405} - 1\right]$$

For discharges occurring on or after October 1, 1995, the indirect medical education factor equals the following:

$$1.43 \times \left[\left(1 + \frac{\text{interns and residents}}{\text{beds}}\right)^{.5795} - 1\right]$$

We proposed to amend § 412.118 (c) and (d) to implement the provisions of amended section 1886(d)(5)(B)(ii) of the Act. We received no comments on these changes; therefore, they are adopted as proposed.

I. Interim Payment Provision for Hospitals with Unusually Long Lengths of Stay (Section 412.116)

On August 15, 1986, we published a final rule, effective for discharges occurring on or after July 1, 1987, which provided for the elimination of the PIP method of payment for all hospitals (51 FR 29386) except for services furnished by rural hospitals with fewer than 100 beds. Under PIP, a hospital is paid on an interim basis for services furnished to beneficiaries. These interim payments are based on the hospital's projected annual costs (for hospitals excluded from the prospective payment system) or payments under the prospective payment system for Medicare patients and are made in equal biweekly payments to the hospital without regard to the submission of individual bills. Any overestimation or underestimation of the hospital's actual costs or total prospective payments to the extent not adjusted during the year is adjusted at the time of cost report settlement.

Because prospective payments are based on discharge information and, therefore, cannot be made until after discharge, in the August 15, 1986 final rule, we included a provision for special interim payments for unusually long lengths of stay in prospective payment hospitals no longer receiving PIP. Under that provision, a hospital was permitted to request an interim payment if a Medicare beneficiary's stay exceeded 30 days. The amount of the interim payment was equal to the hospital's Federal rate per discharge multiplied by the appropriate DRG weighting factor. Only one interim payment per discharge was permitted. The amount of the interim payment was to be deducted from the final payment determined following the patient's discharge. No such provision was made for hospitals excluded from the prospective payment system since payment to these hospitals is not made on a per discharge basis and they have the option of submitting interim bills during an unusually long stay.

The provisions of the August 15, 1986 final rule were effectively invalidated by section 9311(a) of the Omnibus Budget Reconciliation Act of 1986 (Pub. L. 99–509), which added section 1815(e) of the Act to set forth specifically the circumstances under which PIP is available for services furnished by hospitals and other providers. Generally, inpatient hospital services furnished by hospitals excluded from the prospective payment system, as well as skilled nursing facility services, home health services, and hospice care, may be paid on a PIP basis. With certain exceptions, inpatient hospital services furnished by prospective payment hospitals are not eligible for payment on a PIP basis. Subsequently, we published a final rule with comment period on January 21, 1988 (53 FR 1621) which, in addition to implementing the provisions of section 1815(e) of the Act, eliminated the provision allowing a special interim payment for long stay cases set forth in the August 15, 1986 final rule.

In response to the January 21, 1988 final rule, we received a number of comments objecting to the elimination of the provision for special interim payments for unusually long lengths of stay. These commenters cited that we had originally provided for the special interim payments in order to alleviate the cash flow problems that certain hospitals might encounter after they no longer received PIP. The commenters indicated that a cash flow shortage continues to be a problem for a hospital that cannot receive any Medicare payment for a patient who has been in the hospital for an unusually long time. Some commenters believed that the problem was more acute for small hospitals or for rural hospitals, but all believed that not receiving an interim payment for a long-stay patient represented a hardship to the hospital. Others commented that the problem is exacerbated by the fact that the number of patients remaining in their hospitals awaiting skilled nursing facility (SNF) placement is increasing due to the shortage of beds in Medicare-participating SNFs in their areas.

In addition to the hardships raised by the commenters, the enactment on July 1, 1988 of the Medicare Catastrophic Coverage Act of 1988 (Pub. L. 100–360) has had an adverse impact on prospective payment hospitals with unusually long lengths of stay. Before enactment of Pub. L. 100–360, a beneficiary was entitled to 90 days of inpatient hospital services during each spell of illness. In addition, a beneficiary could draw from a lifetime reserve of 60 days if that beneficiary's inpatient hospital days exceeded 90 days in a spell of illness. However, under section 1812(a)(1) of the Act, as amended by section 101(b) of Pub. L. 100–360, essentially unlimited inpatient hospital days are available for Medicare beneficiaries effective with services furnished on or after January 1, 1989. Therefore, effective January 1, 1989, in extremely long stay cases, Medicare payment for benefits that previously would have been exhausted will continue to accrue until discharge.

In light of the comments discussed above and the changes made by Pub. L. 100–360, we have reconsidered our position with respect to providing some form of special interim payment to prospective payment hospitals for long stays. We are revising the regulations at § 412.116 to state that hospitals subject to the prospective payment system that are not on PIP may request a special interim payment after a patient has been in the hospital at least 60 covered days and may request additional interim payments thereafter at intervals of at least 60 days. We believe that this

policy represents a reasonable and equitable solution for those hospitals that, with respect to extremely long stay cases, have been adversely affected by the elimination of PIP.

The amount of the initial interim payment will be equal to the rate for the DRG that results from applying the GROUPER classification to the diagnosis, procedures, and other pertinent information that is reported on the initial interim bill. The payment for the initial interim bill will be determined as if the bill were the final bill. That is, the intermediary will pay the hospital based on the DRG determined for the bill plus any outlier payments as of the date of the last day for which services have been billed. Subsequent interim bills, including the final bill, will be processed as adjustment bills, with payment determined as if the bill were the final bill. Generally, the adjusted payment from subsequent bills will result from outlier payments accruing since the previous bill. These special interim payments are effective [date of publication] for all qualifying current and subsequent inpatient hospital admissions.

As we stated above, this change to our payment policy is made primarily in response to the comments received on the January 21, 1988 final rule with respect to the special interim payments issue. We have made our final determination on this issue and are publishing it at this time because we believe it to be of paramount importance to the hospital industry as well as in the best interest of the public to issue as soon as possible. The other comments submitted in response to the January 21 final rule will be addressed in a separate document to be published in the future.

V. Other ProPAC Recommendations

As required by law, we reviewed the March 1, 1989 report submitted by ProPAC and gave its recommendations careful consideration in conjunction with the proposals set forth in the proposed rule. We also responded to the individual recommendations in the proposed rule. The comments we received on our treatment of the ProPAC recommendations are set forth below along with our responses to those comments. However, if we received no comments from the public concerning a ProPAC recommendation or our response to that recommendation, we have not repeated the recommendation and response in the discussion below. Recommendations 1 through 7 concerning the update factors are discussed in Appendix B of this document. Recommendation 13 concerning reassignment of patients with Guillain-Barre syndrome is discussed in section II.B. of this preamble.

A. Adjustments to the Prospective Payment System Payment Formula

Indirect Medical Education Adjustment (Recommendation 8)

Recommendation: The Secretary should seek legislation to reduce the indirect medical education adjustment from 7.7 percent to 6.6 percent for FY 1990. This reduction should be implemented in a budget neutral fashion with the savings returned to all hospitals through corresponding increases in the standardized amounts. ProPAC estimates that the indirect medical education adjustment should be 4.4 percent. However, concern about implementing such a large reduction led ProPAC to recommend that only one-third of the total reduction be implemented this year. ProPAC also recommends that further reductions should be made only after review of costs and analysis of impact.

Response in the Proposed Rule: We agree that the current indirect medical education adjustment paid to teaching hospitals is excessive and should be reduced. We believe that the adjustment should be reduced to 4.05 percent for each 10 percent increment in the intern and resident-to-bed ratio applied on a curvilinear basis. That figure represents our estimate of the actual impact of the indirect costs of teaching activity on hospital costs. We note that this figure does not differ significantly from the ProPAC estimate, which is 4.4 percent for each 10 percent increment in the ratio of interns and residents-to-beds.

Our analyses indicate that teaching hospitals have had favorable Medicare operating margins under the prospective payment system. Hospitals, on average, experienced operating margins of 5.3 percent during FY 1987. Teaching hospitals, on the average, experienced higher Medicare operating margins. Teaching hospitals with an intern and resident-to-bed ratio of less than 25 percent had Medicare operating margins of 7.6 percent during FY 1987; teaching hospitals with greater than a 25 percent intern and resident-to-bed ratio had Medicare operating margins of 13.6 percent on average during FY 1987.

We believe that teaching hospitals have fared exceptionally well under the prospective payment system and are able to absorb a reduction in the indirect medical education adjustment. Therefore, while we recognize that a change in the adjustment from 7.7 percent to 4.05 percent is sizeable, we do not believe that gradually reducing the adjustment, as ProPAC has recommended, is justified. Moreover, in view of the budgetary constraints, we believe it would be inappropriate to pay in excess of the estimate of the actual indirect costs of teaching activity. Further, because we believe payments to other hospitals are adequate, we believe that the change in the indirect medical education adjustment formula should not be implemented in a budget neutral fashion.

Comment: Several commenters objected to our recommendation concerning the adjustment factor for indirect medical education. Some commenters urged that we accept ProPAC's recommendation for a phased-in reduction of the adjustment, that is, for FY 1990, from 7.7 to 6.6 percent. Others objected to any reduction in the adjustment.

Response: We want to note that we did not propose to reduce the adjustment for indirect medical education in the proposed rule. Since the current adjustment is required by section 1886(d)(5)(B)(ii) of the Act, any change to the formula would require legislation. In the proposed rule, we were responding to a recommendation submitted by ProPAC that the Secretary seek legislation to reduce the adjustment formula. We responded that we concurred with ProPAC that the current formula results in an adjustment that is excessive and indicated that we believe the adjustment should be reduced from the current 7.7 percent to 4.05 percent (54 FR 19655).

We based our recommendation on the results of a 1985 study conducted by the Congressional Budget Office (CBO) that shows that the average cost per Medicare discharge increases by 4.05 percent for each 10 percent increase in the intern-to-bed ratio. A more recent study conducted by CBO ("Setting Medicare's Indirect Teaching Adjustment for Hospitals," May 1989) found that, depending on the model used, the adjustment factor could range from a low of 3.5 percent to a high of 5.2 percent. In addition, a study by the General Accounting Office (GAO) (as well as the ProPAC study) confirms that the current adjustment is excessive. (GAO Report No. HRD–89–33, January 5, 1989, "Medicare Indirect Medical Education Payments Are Too High.") GAO used several different models to estimate the effect of teaching programs on Medicare inpatient operating costs per discharge. Depending on the model used in the analysis, GAO estimated that the teaching effect on the Medicare cost per discharge ranges from 3.73

percent to 6.51 percent. The model that includes the Medicare payment variables, outlier cases, and bed size estimates the teaching effect at 4.05 percent.

B. Quality of Care

Evaluation of PRO Review of Quality of Care (Recommendation 14)

Recommendation: The Secretary should evaluate the impact of the PROs on quality of care. Intensified analysis of the PRO findings and validation of the PRO quality review process should be included in the evaluation. The validity, reliability, and efficiency of the PRO quality screens should receive special emphasis in the evaluation. In addition, the Secretary should continue to develop, test, and implement more sophisticated methods of inpatient and outpatient quality review. The Secretary should also develop additional mechanisms to identify and evaluate quality of care beyond the immediate period of hospitalization, placing more emphasis on outcomes of care.

Response in the Proposed Rule: We agree with the recommendation for evaluation of the impact of PROs on quality of care. We have the following two mechanisms in place that evaluate a PRO's application of quality screens:

- An independent contractor, the so-called "SuperPRO" (currently Systemetrics, Inc.), validates the determinations made by a PRO specifically to identify quality issues that should have been addressed by the PRO using generic screening criteria. This review is a rereview of the medical records originally examined by the PRO. Whenever discrepancies arise, the PRO is given an opportunity to rebut the SuperPRO's findings. The final SuperPRO decisions are used as educational tools for PROs. HCFA also reviews these decisions to identify areas in which corrective action is needed. During the PRO contract negotiations, SuperPRO findings, including those related to generic quality screens, will be considered in the PRO evaluation process.
- The Peer Review Organization Monitoring Protocol and Tracking System (PROMPTS) monitors the PROs performance in the area of quality of care. PROMPTS involves regional office rereview of PRO clinical decisions, including generic screen failures. If the regional office disagreements with a PRO's decisions exceeds a specific threshold, the PRO must submit a corrective action plan. These corrective actions are then monitored by HCFA, and subsequent SuperPRO findings are closely examined to monitor a PRO's performance. We routinely analyze those areas where the disagreement rate exceeds the threshold and require the PRO to take additional corrective action, if necessary. Additionally, the PRO's performance in this activity is considered in the PRO evaluation process.

SuperPRO and PROMPTS are essential parts of the PRO evaluation process and are used to carefully monitor and evaluate the validity, reliability, and efficiency of PRO application of quality screens. HCFA agrees with ProPAC's recommendation that the Secretary should continue to develop, test, and implement more sophisticated methods of inpatient and outpatient quality review.

Additionally, we are developing methodology for the PROs to use in proposing pilot projects in each of these areas. For example, we will be looking at proposals under which the PROs would review the quality of care in physicians' offices and in other outpatient settings. The pilot studies would be designed to track the patient across all settings in which care is received to assess health longitudinally. We also will be planning pilot projects under which PRO review will be lessened in hospitals whose performance appears superior, as judged by such things as consistently lower than expected risk-adjusted mortality and rehospitalization rates. This will help us to determine whether patient outcomes in these hospitals differ significantly from those where the normal PRO review process is in place.

Comment: One commenter disagreed with our assertion that our existing PRO review activities are sufficient. The commenter noted that these activities represent simply administrative tools used in the administration of the program and that it is time to undertake a thorough, independent review of the impact of PROs on quality of care for Medicare beneficiaries.

Response: We do not agree that all of the activities we cited are mere evaluative tools and, thus, simply administrative mechanisms used in the proper and efficient administration of the program. We are, however, about to begin a demonstration to review services furnished by physicians in various settings (ranging from inpatient hospital services to those furnished in physicians' offices). This review, which will include reviews of beneficiaries who have been hospitalized, will enable us to discern the outcomes experienced by beneficiaries.

In addition, we have begun a project, which collects abstracted clinical data, to detect deteriorations of improvements in the medical treatment of Medicare beneficiaries. These may be measured by changes from year to year in the incidence of interventions such as hospitalization or by diagnostic or therapeutic interventions in the ambulatory setting and in the outcomes of such interventions as measured by mortality, morbidity, disability, and expenditures. To establish a baseline measure of health and functional statutes, we are considering developing a registry that will contain assessments of the condition of the Medicare beneficiary at the time of entry and at appropriate intervals thereafter. Such information will permit more effective evaluation of trends by taking into account the variations in the initial condition of the beneficiary.

The data generated from these and other pilot projects will allow us to refine goals and objectives for the program based upon outcome measurements. While this also could be considered part of good program administration, we view it as an assessment of the program's overall impact. Any other measurement activity would require baseline comparative data, which are not currently available.

C. Ambulatory Surgery Payment

1. Medicare Payment for Hospital Outpatient Surgery (Recommendation 16)

Recommendation: Beginning in FY 1990, Medicare payment for the facility component of hospital outpatient surgery including capital should be entirely prospective. Separate rates should be established for each of the six groups proposed for payment of services furnished in ambulatory surgery centers (ASCs). The rate for FY 1990 should be based on a blend of hospital-specific costs, average hospital costs, and the rate paid to freestanding ASCs. The rate should be updated annually.

The level of the prospective rates should be the same in FY 1990 as they would have been under current policy. Payments should be adjusted to reflect differences in area wages. These changes in hospital outpatient surgery payment policy should apply to the list of ASC-approved procedures only; other Medicare payment provisions should continue for all other procedures. ProPAC does not recommend special treatment of eye and ear specialty hospitals.

Response in the Proposed Rule: We agree with ProPAC's objective to develop a prospective payment system for hospital outpatient ambulatory surgical services. However, we do not agree with the approach ProPAC has recommended. As we stated in our interim report to Congress last year on this subject, a prospective payment system for hospital outpatient ambulatory surgical services should be based on two basic principles. First, Medicare program outlays should be no greater under a hospital outpatient prospective payment system than under the current system. Second, the prospective payment system should create a level playing field between ASC and hospital outpatient departments; that is, any difference between hospital-based payments and ASC payments should be based on justifiable differences in cost.

We plan to continue studying different approaches to incorporate hospital outpatient surgical services into a prospective payment system that is based on the principles stated above. Thus, we recommend no further changes to the hospital outpatient ambulatory surgical payment system at this time.

Comment: We received one comment, which was from ProPAC. While ProPAC basically agrees with the premise of our response in the proposed rule, it continues to recommend an interim prospective payment system for hospital outpatient surgeries. In addition, ProPAC recommended an investigation of ways to improve data from ASCs.

Response: We continue to believe we should not support any changes in Medicare payment policy for hospital outpatient surgical procedures at this time. Instead, we will continue in our efforts to develop a fully prospective payment system for all hospital outpatient services as mandated by section 1135(d) of the Act, as enacted by section 9343(f) of Pub. L. 99–509.

ProPAC's comment stated that ProPAC agreed with us that an outpatient prospective payment system should recognize justifiable differences in costs of furnishing services between hospital outpatient departments and ASCs. However, while ProPAC identified several factors that would account for the cost difference, ProPAC stated that the effect on costs in not understood and proposed that the interim system give "less prominence" to the freestanding ASC rates in establishing the outpatient rates. In this regard, since Congress mandated that any such differences in costs between ASCs and hospital outpatient departments be taken into account in establishing a prospective system (section 1135(d) of the Act), we do not believe a prospective payment system should be implemented. In addition, ProPAC's concern regarding data constraints with respect to ASC rates further justifies our position to make no changes at the present time.

Our recommendation is based on the fact that we do not have sufficient data at this time to assess the impact the proposed changes would have on beneficiaries, hospitals, and the Medicare program. We are only just beginning to receive the first cost reports reflecting the current payment system for ambulatory surgical procedures in hospitals. In addition, various studies are now being conducted that should provide valuable data when completed. We believe a move from the current system to a new system on a temporary basis would be very disruptive to the industry, and implementing the system would place a significant strain on our current resources, particularly in such a short period of time as the ProPAC's proposal would require. Therefore, we continue to recommend no further changes at this time.

2. Beneficiary Liability for Hospital Outpatient Surgery (Recommendation 17)

Recommendation: The Secretary should modify the methodology used to determine Medicare Part B coinsurance for certain ambulatory surgery services performed in hospital outpatient departments. Currently, beneficiary coinsurance is based on hospital submitted charges. ProPAC believes that beneficiary coinsurance should be limited to 20 percent of the payment amount allowed by Medicare. The Medicare program should bear the costs of the change.

Response in the Proposed Rule: As was stated in our response to Recommendation 16, we oppose making any changes to the present payment system for ambulatory surgical services. Therefore, we would be unable to implement this ProPAC recommendation for the present time.

In addition, the present system pays in the aggregate for surgery performed in a hospital outpatient setting based on the lesser of cost or charges or a blend of a hospital-specific amount and the ASC payment amount. Because the system is based on payments in the aggregate, calculated upon retroactive settlement, it is not possible to determine the actual payment amount based on individual bills, as would be necessary to implement ProPAC's proposal. Therefore, we believe that no changes should be made at this time.

Comment: In its comments on the proposed rule, ProPAC reiterated its position that the Medicare program should assume responsibility for 80 percent of the payment amount. ProPAC recommended that the method for calculating part B coinsurance for hospital outpatient surgery be modified.

Response: As we stated above, we recommend no change to the present payment system. This being the case, ProPAC's recommendation, which is based on a fully prospective payment system, would not apply under the present system. Under the present system, Medicare payment is not determined on an individual beneficiary basis but is made in the aggregate for all ASC beneficiary services furnished during the cost reporting period. Therefore, we will give this recommendation consideration after a prospective payment system for all outpatient services is in place.

VI. Other Required Information

A. Effective Dates

The effective date of this final rule (including the addendum and appendixes) is October 1, 1989. However, the changes we are making to § 412.116 concerning special interim payments to hospitals not receiving PIP for unusually long lengths of stay are effective on September 1, 1989.

B. Waiver of 30-Day Delay in the Effective Date

We ordinarily provide for a 30-day delay in the effective date of a substantive final rule. However, if adherence to this procedure would be impractical, unnecessary, or contrary to public interest, we may waive the delay in the effective date. As discussed in detail in section IV.I. of this preamble, on January 21, 1988, we published a final rule with comment period that set forth, in part, the circumstances under which a prospective payment hospital could receive PIP payments for the services it furnishes. That rule implemented the provisions of section 9311(a) of Pub. L. 99–509, which effectively invalidated an August 15, 1986 final rule in which we had eliminated PIP for all hospitals except small rural hospitals.

Although the August 15, 1986 final rule had provided for a special interim payment to prospective payment hospitals not receiving PIP for unusually long stays, we did not make that same provision in the January 21, 1988 final rule. However, in this final rule, after consideration of the comments we received in response to the January 21, 1988 final rule concerning the special interim payment and because of the elimination of a day limitation on hospital inpatient services by section 101(b) of Pub. L. 100–360, we have decided to restore the special interim payment to prospective payment hospitals not receiving PIP.

We have made this change effective on September 1, 1989, for all current qualifying inpatient hospitals admissions. If we were to provide a 30-day delay in the effective date of these changes, hospitals experiencing these unusually long stays would be required to wait another 30 days before requesting a special interim payment and thus be deprived of the benefits of this change. Thus, a 30-day delay in effective date would be contrary to public interest. For these reasons, we find good cause to waive the normal 30-day delay in effective date for the changes made to § 412.116.

C. Paperwork Reduction Act

This final rule does not impose information collection requirements. Consequently, it need not be reviewed by the Office of Management and Budget under the authority of the Paperwork Reduction Act of 1980 (44 U.S.C. 3501–3511).

D. List of Subjects in 42 CFR Part 412

Health facilities, Medicare.

42 CFR part 412 is amended as set forth below:

Chapter IV—Health Care Financing Administration, Department of Health and Human Services

Subchapter B—Medicare Programs

PART 412—PROSPECTIVE PAYMENT SYSTEM FOR INPATIENT HOSPITAL SERVICES

A. The authority citation for part 412 continues to read as follows:

Authority: Secs. 1102, 1122, 1815(e), 1871, and 1886 of the Social Security Act (42 U.S.C. 1302, 1320a–1, 1395g(e), 1395hh, and 1395ww).

Subpart A—General Provisions

B. Subpart A is amended as follows:

§ 412.8 [Amended]

In § 412.8, paragraph (b)(4) is removed.

Subpart F—Payment for Outliers

C. Subpart F is amended as follows:

§ 412.84 [Amended]

In § 412.84(k), the phrase "and before October 1, 1989" is removed, and the cross reference to "paragraph (i)" is revised to read "paragraph (j)."

Subpart G—Special Treatment of Certain Facilities

D. Subpart G is amended as follows:

1. In § 412.92, the introductory text of paragraph (a) is republished; in paragraph (a)(1), the introductory text of paragraph (a)(2), and paragraph (a)(2)(i), the number "50" is revised to read "35"; paragraph (a)(3) is revised; in paragraph (b)(1)(ii)(B), the number "50" is revised to read "35"; paragraph (b)(4)(iii) is revised; in the introductory text of paragraph (e)(3) and paragraph (e)(3)(i), the term "HCFA" is revised to read "the intermediary"; paragraph (e)(3)(ii) is revised; in paragraph (e)(3)(iii), the term "HCFA" is revised to read "the intermediary"; and, in paragraph (g)(6), the phrase, "beginning before October 1, 1989" is removed. The changes read as follows:

§ 412.92 Special treatment: Sole community hospitals.

* * * * *

(a) *Criteria for classification as a sole community hospital.* HCFA classifies a hospital as a sole community hospital if it is located in a rural area (as defined in § 412.62(f)), and meets one of the following conditions: * * *

(3) The hospital is located between 15 and 25 miles from other like hospitals but because of local topography or periods of prolonged severe weather conditions, the other like hospitals are inaccessible for at least 30 days in each 2 out of 3 years.

(b) *Classification procedures.* * * *

(4) *Cancellation of classification.* * * *

(iii) If a hospital requests that its sole community hospital classification be cancelled, it may not be reclassified as a sole community hospital unless it meets the following conditions:

(A) At least one full year has passed since the effective date of its cancellation.

(B) The hospital meets the qualifying criteria set forth in paragraph (a) of this section in effect at the time it reapplies.

* * * * *

(e) *Additional payments to sole community hospitals experiencing a significant volume decrease.* * * *

(3) * * *

(ii) The intermediary makes its determination within 180 days from the date it receives the hospital's request and all other necessary information.

* * * * *

2. In § 412.94, paragraph (b)(1) is revised and a new paragraph (b)(4) is added to read as follows:

§ 412.94 Special treatment: Cancer hospitals.

* * * * *

(b) *Payment.* (1) A hospital meeting the criteria in paragraph (a) of this section may elect, during its first cost reporting period subject to the prospective payment system, to be paid on a reasonable cost basis under part 413 of this chapter (and under other regulations governing reasonable cost in subparts D and E of part 405 of this chapter), and subject to the rate of increase limit under § 413.40 of this chapter.

* * * * *

(4) A hospital that elects reasonable cost reimbusement is otherwise subject to the prospective payment system with respect to hospital inpatient services, as provided in § 412.20. The provisions in §§ 412.113 and 412.116 concerning payment for capital-related costs and method of payment for inpatient hospital services, respectively, are applicable to such a hospital.

3. In § 412.96, paragraph (f) is revised to read as follows:

§ 412.96 Special treatment: Referral centers.

* * * * *

(f) *HCFA review of referral center status.*—(1) *General rule.* The status of each hospital that is receiving a referral center adjustment is reviewed by the HCFA regional office every 3 years to determine if the hospital continues to meet the applicable criteria.

(2) *Retention criteria.* To retain referral center status, a hospital must meet the applicable criteria—

(i) In at least 2 of the last 3 years; or

(ii) For the current year.

(3) *Cancellation of referral center status.* If a hospital does not meet either of the retention criterion in paragraph (f)(2) of this section and no longer qualifies for a referral center adjustment, HCFA discontinues the adjustment beginning on the first day of the hospital's next cost reporting period.

* * * * *

4. Section 412.106 is revised to read as follows:

§ 412.106 Special treatment: Hospitals that serve a disproportionate share of low-income patients.

(a) *General considerations.* (1) The factors considered in determining whether a hospital qualifies for a payment adjustment include the number of beds, the number of patient days, and the hospital's location.

(i) The number of beds in a hospital is determined in accordance with § 412.118(b).

(ii) The number of patient days includes only those days attributable to areas of the hospital that are subject to the prospective payment system and excludes all others.

(iii) The hospital's location, in an urban or rural area, is determined in

accordance with the definitions in § 412.62(f).

(2) The payment adjustment is applied to the hospital's total DRG revenues.

(i) A hospital's total DRG revenues are determined on the basis of DRG-adjusted prospective payment rates or, for transition period payments, on the basis of the Federal portion of the hospital's payment rates.

(ii) For purposes of this section, total DRG revenues include outlier payments under Subpart F of this part, but exclude additional payments made under this subpart or under § 412.118 for indirect medical education costs.

(b) *Determination of a hospital's disproportionate patient percentage*—(1) *General rule.*

A hospital's disproportionate patient percentage is determined by adding the results of two computations and expressing that sum as a percentage.

(2) *First computation: Federal fiscal year.* For each month of the Federal fiscal year in which the hospital's cost reporting period begins, HCFA—

(i) Determined the number of covered patient days that—

(A) Are associated with discharges occurring during each month; and

(B) Are furnished to patients who during that month were entitled to both Medicare Part A and SSI, excluding those patients who received only State supplementation;

(ii) Adds the results for the whole period; and

(iii) Divides the number determined under paragraph (b)(2)(ii) of this section by the total number of patient days that—

(A) Are associated with discharges that occur during that period; and

(B) Are furnished to patients entitled to Medicare Part A.

(3) *First computation: Cost reporting period.* If a hospital prefers that HCFA use its cost reporting period instead of the Federal fiscal year, it must furnish its intermediary, in machine-readable format as prescribed by HCFA, data on its Medicare part A patients for its cost reporting period.

(4) *Second computation.* The fiscal intermediary determines, for the hospital's cost reporting period, the number of patient days furnished to patients entitled to Medicaid but not to Medicare part A, and divides that number by the total number of patient days in that same period.

(5) *Disproportionate patient percentage.* The intermediary adds the results of the first computation made under either paragraph (b)(2) or (b)(3) of this section and the second computation made under paragraph (b)(4) of this section and expresses that sum as a percentage. This is the hospital's disproportionate patient percentage, and is used in paragraph (c) of this section.

(c) *Criteria for classification.* A hospital is classified as a "disproportionate share" hospital under any of the following circumstances:

(1) The hospital's disproportionate patient percentage, as determined under paragraph (b)(5) of this section, is at least equal to one of the following:

(i) 15 percent, if the hospital is located in an urban area and has 100 or more beds, or is located in a rural area and has 500 or more beds.

(ii) 40 percent, if the hospital is located in an urban area and has fewer than 100 beds.

(iii) 45 percent, if the hospital is located in a rural area and has fewer than 500 beds.

(2) The hospital is located in an urban area, has 100 or more beds, and can demonstrate that, during its cost reporting period, more than 30 percent of its net inpatient care revenues are derived from State and local government payments for care furnished to indigent patients.

(d) *Payment adjustment*—(1) *Method of adjustment.* If a hospital serves a disproportionate number of low-income patients, its total DRG revenues are increased by an adjustment factor as specified in paragraph (d)(3) of this section.

(2) *Effective dates for payment adjustment.* Payment adjustment under this section is effective for discharges that occur on or after May 1, 1986 (October 1, 1988 for rural hospitals with 500 or more beds) and before October 1, 1995.

(3) *Payment adjustment factors.* (i) If the hospital meets the criteria of paragraph (c)(1)(i) of this section, the payment adjustment factor is 2.5 percent, plus one-half the difference between the hospital's disproportionate patient percentage and 15 percent.

(ii) If the hospital meets the criteria of paragraph (c)(1)(ii) of this section, the payment adjustment factor is 5 percent

(iii) If the hospital meets the criteria of paragraph (c)(1)(iii) of this section, the payment adjustment factor is 4 percent

(iv) If the hospital meets the criteria of paragraph (c)(2) of this section, the payment adjustment factor is 25 percent.

Subpart H—Payments to Hospitals Under the Prospective Payment System

E. Subpart H is amended as follows:

1. In § 412.116, paragraphs (d) and (e) are redesignated as paragraph (e) and (f), respectively, and a new paragraph (d) is added to read as follows:

§ 412.116 Method of payment.

* * * * *

(d) *Special interim payment for unusually long lengths of stay.*—(1) *First interim payment.* A hospital that is not receiving periodic interim payments under paragraph (b) of this section may request an interim payment after a Medicare beneficiary has been in the hospital at least 60 days. Payment for the interim bill is determined as if the bill were a final discharge bill and includes any outlier payment determined as of the last day for which services have been billed.

(2) *Additional interim payments.* A hospital may request additional interim payments at intervals of at least 60 days after the date of the first interim bill submitted under paragraph (d)(1) of this section. Payment for these additional interim bills, as well as the final bill, is determined as if the bill were the final bill with appropriate adjustments made to the payment amount to reflect any previous interim payment made under the provisions of this paragraph (d).

* * * * *

§ 412.118 [Amended]

2. In § 412.118, in paragraphs (c)(1), (c)(2), (d)(1), and (d)(2), the phrase "October 1, 1990" is revised to read "October 1, 1995".

(Catalog of Federal Domestic Assistance Program No. 13.773, Medicare—Hospital Insurance)

Acting Administrator, Health Care Financing Administration.

Approved: August 25, 1989.

Louis W. Sullivan,

Secretary.

Editorial Note: The following addendum and appendixes will not appear in the Code of Federal Regulations.

ADDENDUM—SCHEDULE OF STANDARDIZED AMOUNTS EFFECTIVE WITH DISCHARGES ON OR AFTER OCTOBER 1, 1989 AND UPDATE FACTORS AND TARGET RATE PERCENTAGES EFFECTIVE WITH COST REPORTING PERIODS BEGINNING ON OR AFTER OCTOBER 1, 1989

I. Summary and Background

In this addendum, we are making changes in the amounts and factors for determining prospective payment rates for Medicare inpatient hospital services. We are also setting forth new target rate percentages for determining the rate-of-increase limits (target amounts) for hospitals and hospital units excluded from the prospective payment system.

For hospital cost reporting periods beginning on or after October 1, 1989, except for sole community hospitals and hospitals located in Puerto Rico, each hospital's payment per discharge under the prospective payment system will be comprised of 100 percent of the Federal rate. Except for hospitals affected by the regional floor, the Federal rate is based on 100 percent of the national rate.

Sole community hospitals are to be paid on the basis of a rate per discharge composed of 75 percent of the hospital-specific rate and 25 percent of the applicable Federal regional rate (section 1886(d)(5)(C)(ii) of the Act). Hospitals in Puerto Rico are paid on the basis of a rate per discharge composed of 75 percent of a Puerto Rico rate and 25 percent of a national rate (section 1886(d)(9)(A) of the Act). Hospitals affected by the regional floor are paid on the basis of 85 percent of the Federal national rate and 15 percent of the Federal regional rate.

As discussed below in section II, we are making changes in the determination of the prospective payment rates. The changes, to be applied prospectively, will affect the calculation of the Federal rates. Section III sets forth our changes for determining the rate-of-increase limits for hospitals excluded from the prospective payment system. The tables to which we refer in the preamble to the final rule are presented at the end of this addendum in section IV.

II. Changes to Prospective Payment Rates for Hospitals for FY 1990

The basic methodology for determining prospective payment rates is set forth at § 412.63 for hospitals located outside of Puerto Rico. The basic methodology for determining the prospective payment rates for hospitals located in Puerto Rico is set forth at §§ 412.210 and 412.212. Below we discuss the manner in which we are changing some of the factors used for determining the prospective payment rates. The Federal and Puerto Rico rate changes, once issued as final, will be effective with discharges occurring on or after October 1, 1989. As required by section 1886(d)(4)(C) of the Act, we must adjust the DRG classifications and weighting factors for discharges in FY 1990.

In summary, the standardized amounts set forth in Tables 1a, 1b, and 1c of section IV of this addendum were—

- Adjusted to ensure budget neutrality as provided in section 1886(d)(8)(D) of the Act;
- Adjusted by the revised urban and rural outlier offsets; and
- Updated by 5.5 percent (that is, the market basket percentage increase).

A. Calculation of Adjusted Standardized Amounts

1. Standardization of Base-Year Costs or Target Amounts

Section 1886(d)(2)(A) of the Act required the establishment of base-year cost data containing allowable operating costs per discharge of inpatient hospital services for each hospital. The preamble to the interim final rule, published September 1, 1983 (48 FR 39763), contains a detailed explanation of how base-year cost data were established in the initial development of standard amounts for the prospective payment system and how they are used in computing the Federal rates.

Section 1886(d)(9)(B)(i) of the Act required that Medicare target amounts be determined for each hospital located in Puerto Rico for its cost reporting period beginning in FY 1987. The September 1, 1987 final rule contains a detailed explanation of how the target amounts were determined and how they are used in computing the Puerto Rico rates (52 FR 33043, 33066).

The standardized amounts are based on per discharge averages of adjusted hospital costs or, for Puerto Rico, adjusted target amounts, from a base period, updated and otherwise adjusted in accordance with the provisions of section 1886(d) of the Act. Sections 1886 (d)(2)(C) and (d)(9)(B)(ii) of the Act required that the updated base-year per discharge costs and, for Puerto Rico, the updated target amounts, respectively, be standardized in order to remove from the cost data the effects of certain sources of variation in cost among hospitals. These include case mix, differences in area wage levels, cost of living adjustments for Alaska and Hawaii, indirect medical education costs, and payments to hospitals serving a disproportionate share of low-income patients.

Since all adjustments for variation in hospital operating costs or target amounts have already been accounted for consistent with the construction of the standardized amounts, no revision was made at the hospital level for those factors. That is, the adjustments for differences in case mix, wages, cost-of-living, indirect medical education costs, and payments to hospitals serving a disproportionate share of low-income patients reflected in the FY 1990 standardized amounts are identical to those reflected in the current (FY 1989) standardized amounts.

2. Computing Urban and Rural Averages Within Geographic Areas

In determining the prospective payment rates for FY 1984, section 1886(d)(2)(D) of the Act required that the average standardized amounts be determined for hospitals located in urban and rural areas of the nine census divisions and the nation. Under section 1886(d)(9)(B)(iii) of the Act, the average standardized amount per discharge for FY 1988 must be determined for hospitals located in urban and rural areas in Puerto Rico.

For FY 1990, except for hospitals in Puerto Rico and those hospitals that are affected by the regional floor, the Federal rates will be comprised of 100 percent of the national rate (section 1886(d)(1)(A)(iii) of the Act). The Federal rate for hospitals affected by the regional floor is based on 85 percent of the national rate and 15 percent of the regional rate. Section 1886(d)(5)(C)(ii) of the Act specifies that a sole community hospital's Federal rate is based on 100 percent of the regional rate. Hospitals in Puerto Rico are paid a blend of 75 percent of the applicable Puerto Rico standardized amount and 25 percent of a national standardized payment amount.

Section 4002(c)(1) of the Omnibus Budget Reconciliation Act of 1987 (Pub. L. 100–203) amended section 1886(d)(3) of the Act to require the Secretary to compute three average standardized amounts for discharges occurring in a fiscal year beginning on or after October 1, 1987: one for hospitals located in rural areas; one for hospitals located in large urban areas; and one for hospitals located in other urban areas. Section 4002(b) of Pub. L. 100–203 amended section 1886(d)(2)(D) of the Act to define a "large urban area" as an urban area with a population of more than 1,000,000. In addition, section 4009(i) of Pub. L. 100–203 provides that a New England County Metropolitan Area (NECMA) with a population of more than 970,000 is classified as a large urban area. As required by section 1886(d)(2)(D) of the Act, population size is determined by the Secretary based on the latest population data published by the Bureau of the Census. Under that section as now amended, urban areas that do not meet the definition of a "large urban area" are referred to as "other urban areas."

Based on 1987 population estimates published by the Bureau of the Census, the current 46 large urban areas continue to meet the criteria to be defined as large urban areas for FY 1990. A list of those areas was set forth in a notice published on April 5, 1988 at 53 FR 11138. In addition, these areas are identified by an asterisk in Tables 4a and 4c as set forth in section IV of this addendum. No additional areas were identified. Therefore, we are making no change in these areas for purposes of this final rule.

Table 1a contains the three national standardized amounts that would be applicable to most hospitals. Table 1b sets forth the 27 regional standardized amounts that would be applicable to sole community hospitals and to hospitals subject to the regional floor. Under section 1886(d)(9)(A)(ii) of the Act, the national standardized payment amount applicable to hospitals in Puerto Rico consists of the discharge-weighted average of the national rural standardized amount, the national large urban standardized amount, and the national other urban standardized amount (as set forth in Table 1a). The national average standardized amount for Puerto Rico is set forth in Table 1c. This table also includes the three standardized amounts that would be applicable to most hospitals in Puerto Rico.

The methodology for computing the national average standardized amounts is identical to the methodology for determining the regional amounts.

We stated in the addendum to the proposed rule that the Office of Management and Budget (OMB) may announce revised listings of the Metropolitan Statistical Area (MSA) and NECMA designations that are used in calculating the standardized amounts. We noted that if OMB makes the announcement before we issue the final rule, we would list the revised MSA/NECMA designations in the addendum to the final rule. Consistent with Medicare policy and our regulations at § 412.63(b)(4), any changes in designation are effective for discharges occurring on or after October 1, 1989.

Since publication of the proposed rule, OMB has announced a new MSA, Jamestown-Dunkirk, NY, which comprises the county of Chatauqua and has Jamestown and Dunkirk as its central cities. We have incorporated this change in the final wage index set forth in Tables 4a, 4b, and 4c in the addendum to this final rule.

3. Updating the Average Standardized Amounts

In accordance with section 1886(d)(3)(A) of the Act, we are updating the large urban, other urban, and rural average standardized amounts and the hospital-specific rate (which applies only to sole community hospitals) using the applicable percentage increase specified in section 1886(b)(3)(B)(i) of the Act. The percentage increase to be applied is mandated under that section of the law as the estimated percentage increase in the hospital market basket for hospitals located in all areas. The percentage change in the market basket reflects the average change in the price of goods and services purchased by hospitals to furnish inpatient care. The most recent forecasted hospital market basket increase and, thus, the applicable percentage increase for FY 1990 is 5.5 percent.

The 5.8 percent market basket rate of increase set forth in the proposed rule was based on the February 1989 hospital input price forecasts. However, the August 1989 forecasts indicate a decline in the projected FY 1990 hospital market basket index for the February forecasts. The components of the market basket in which the most significant changes have occurred between the two forecasts include pharmaceuticals, which increased by 0.1 percent, and malpractice insurance, which decreased by 0.3 percent. We note that the decrease in the malpractice insurance forecast occurred because the hospital insurance industry is experiencing a deceleration in malpractice insurance premium increases. Malpractice insurance premiums are now forecasted to increase at a lower rate (three to four percent) than in the February forecast. We also note that the forecast for the main component of the hospital market basket, wages and salaries, remained essentially unchanged from the previous forecast.

Although the update factor for FY 1990 is set by law, we were required by section 1886(e)(3)(B) of the Act to report to Congress no later than March 1, 1989 on our initial recommendation of update factors for FY 1990 for both prospective payment hospitals and hospitals excluded from the prospective payment system. For general information purposes, we published this report as appendix B of the proposed rule. Our final recommendation on the update factors (which is required by sections 1886 (e)(4) and (e)(5)(A) of the Act) is set forth as appendix B of this final rule.

Comment: One commenter stated that the hospital market basket does not accurately reflect the true economic expenses incurred by hospitals since nonhospital wages are included in the labor component of the market basket.

Response: The rebased hospital market basket was established in FY 1987, and we have not proposed any changes to the market basket forecasting methodology for FY 1990. The methodology we used to forecast the market basket inflation for FY 1990 is consistent with that outlined in the September 3, 1986 final rule (51 FR 31461). We do not believe it is appropriate to make changes to specific market basket components without also examining all of the other components of the market basket. While changing the proxy measures used in the wage component of the market basket mey result in a higher inflation forecast for that component, it is also possible that further analysis of the appropriateness of the forecasting measures used in the other components of the market basket could result in lower forecasts being developed. Therefore, we do not believe it is appropriate to adopt changes to various components of the market basket and that any revisions should be made only in conjunction with a complete rebasing of the market basket. Absent rebasing, we believe it is important that the model we use in developing the market basket forecasts be carried forward over a period of years so that forecasts will be consistent from year to year.

We agree that the issue of appropriate wage proxies warrants further consideration. We are planning to include a rebased hospital market basket as a part of the proposed rule concerning changes in the inpatient hospital prospective payment system for FY 1991. We will consider options for revising the market basket components as part of that process.

4. Other Adjustments to the Average Standardized Amounts

a. *Indirect Medical Education.* Section 1886(d)(3)(C)(ii) of the Act provides that, effective for discharges occurring on or after October 1, 1986, the average standardized amounts be further reduced, taking into consideration the effects of the standardization for indirect medical education costs as described in section II.A.1. of this addendum. The required adjustment is to ensure that the program savings that would be achieved through standardizing for indirect medical education on one basis and computing indirect medical education payments on another basis are preserved.

The first such adjustment was implemented for the standardized amounts effective October 1, 1986. (See the September 3, 1986 final rule (51 FR 31521).) Since section 1886(d)(3)(C)(ii) of the Act, as amended by section 4003(a)(2) of Pub. L. 100–203, required a revision of the adjustment due to the reduction of the adjustment factor for computing indirect medical education payments effective October 1, 1988, we made a further adjustment to the standardized amounts effective October 1, 1988 to achieve the incremental savings that resulted from that reduction in indirect medical education payments. See the September 30, 1988 final rule (53 FR 38539) for the factors used to make this adjustment. Since there has been no change in the indirect medical education factor for FY 1990, we are not proposing to make any further adjustment to the standardized amounts for FY 1990.

b. *Rural Hospitals Deemed to be Urban.* Section 1886(d)(8)(B) of the Act provides that certain rural hospitals are deemed urban effective with discharges occurring on or after October 1, 1988. Section 1886(d)(8)(C) of the Act, as added by section 8403(a) of the Technical and Miscellaneous Revenue Act of 1988 (Pub. L. 100–647), specifies that if the wage index values applicable to MSAs that are now deemed to include certain rural hospitals and to the rural areas in which those hospitals are actually located were reduced because of the provisions of section 1886(d)(8)(B) of the Act, those wage index values must be recalculated as if that section had not been enacted. A separate wage index value is calculated for each of the affected counties (that is, those rural counties whose hospitals are deemed urban).

Section 1886(d)(8)(D) of the Act specifies two payment conditions that must be met. First, the FY 1990 urban standardized amounts are to be adjusted so as to ensure that total aggregate payments under the prospective payment system after implementation of the provisions of sections 1886(d)(8)(B) and (C) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. That is, the additional payments to those rural hospitals that have been deemed urban must be financed through a reduction in the urban standardized amounts. Second, the rural standardized amounts are to be adjusted to ensure that aggregate payments to rural hospitals not affected by these provisions neither increase nor decrease as a result of implementation of these provisions. That is, aggregate payments to those rural hospitals that have not been deemed urban should not change as a result of these provisions. The following budget neutrality adjustment factors were applied to the proposed standardized amounts: Urban—.99943; Rural—1.00030.

After further analysis of the effect of payments to rural hospitals as a result of the implementation of section 1886(d)(8)(C) of the Act, we noted inaccuracies in our computation of the proposed budget neutrality adjustment applicable to rural hospitals.

The provisions of section 1886(d)(8)(C) of the Act essentially restore the wage index values for those rural areas negatively impacted by the redesignation of certain rural hospitals previously included in the computation of those areas' rural wage index values. Thus, with implementation of this section, there is no effect on aggregate payments to those rural hospitals. However, hospitals in rural areas that experienced increases in their wage index values when the affected counties were redesignated under section 1886(d)(8)(B) of the Act are allowed to retain those higher values. The net effect of the enactment of sections 1886(d)(8)(B) and (C) of the Act is to increase aggregate payments to rural hospitals over those prior to implementation of these provisions. Therefore, in order to achieve budget neutrality, a decrease in the rural rates would be required to offset the additional payments to rural hospitals whose wage index values have increased. Through an oversight in the methodology used in developing the proposed budget neutrality factor, the rural rates were not adjusted to meet this requirement.

In addition, we incorrectly included rural referral centers not located in redesignated counties with rural hospitals. Since rural referral centers are paid the other urban rate, their payments were reduced by the budget neutrality factor applied to the urban rates. In effect, the methodology we used to calculate the proposed budget neutrality factor applicable to the rural rates would have compensated other rural hospitals for a reduction in payments that they will not incur. Therefore, rural referral centers not located in redesignated counties have been included with urban hospitals for the purpose of the budget neutrality computation. This methodological change has a negligible effect on rural referral centers.

The following adjustment factors were applied to the final standardized amounts: Urban—.99940; Rural—.99925.

c. *Outliers.* Section 1886(d)(5)(A) of the Act requires that, in addition to the basic prospective payment rates, payments must be made for discharges involving day outliers and may be made for cost outliers. Section 1886(d)(3)(B) of the Act correspondingly requires that the urban and rural standardized amounts, respectively, be separately reduced by the proportion of estimated total DRG payments attributable to estimated outlier payments for hospitals located in urban areas and those located in rural areas. Section 1886(d)(9)(B)(iv) of the Act requires that the urban and rural standardized amounts be reduced by the proportion of estimated total payments made to hospitals in Puerto Rico attributable to estimated outlier payments.

Consequently, instead of a uniform reduction factor applying equally to all the standardized amounts, there are two separate reduction factors, one applicable to the urban national and regional standardized amounts and the other applicable to the rural national and regional standardized amounts. Furthermore, sections 1886(d)(5)(A)(iv) and 1886(d)(9)(i) of the Act direct that outlier payments may not be less than five percent nor more than six percent of total payments projected to be made based on the prospective payment rates in any year.

In the September 30, 1988 final rule, we set the outlier thresholds so as to result in estimated outlier payments (prior to consideration of the additional covered days that will result from the elimination of a day limitation on Medicare inpatient hospital services under section 101 of the Medicare Catastrophic Coverage Act of 1988 (Pub. L. 100–360)) equal to 5.1 percent of total prospective payments. We also set the same outlier thresholds and offsets for the Puerto Rico prospective payment standardized amounts as we had for hospitals located outside Puerto Rico. Because certain changes we made to the outlier policy were not effective until November 1, 1988, we had two sets of outlier thresholds for FY 1989. For discharges on or after October 1, 1988 and before November 1, 1988, the day outlier threshold is the geometric mean length of stay for each DRG plus the lesser of 22 days or 2.0 standard deviations and the cost outlier threshold is the greater of 2.0 times the prospective payment rate for the DRG or $23,750. For discharges on or after November 1, 1988, the day outlier threshold is the geometric mean length of stay for each DRG plus the lesser of 24 days or 3.0 standard deviations and the cost outlier threshold is the greater of 2.0 times the prospective payment rate for the DRG or $28,000. The outlier adjustments for FY 1989 were .9437 for the urban rates and .9777 for the rural rates.

We proposed to continue to set the outlier thresholds so as to result in estimated outlier payments equal to 5.1 percent of total prospective payments. Therefore, for FY 1990, we proposed to set the day outlier threshold at the geometric mean length of stay for each DRG plus the lesser of 27 days or 3.0 standard deviations and the cost outlier threshold at the greater of 2.0 times the prospective payment rate for the DRG or $32,000.

The proposed outlier adjustment factors for FY 1990 were as follows: Urban—.943688; Rural—.977956.

In this final rule, we have continued to set the outlier thresholds so as to result in estimated outlier payments equal to 5.1 percent of total prospective payments. Therefore, for FY 1990, the day outlier threshold is the geometric mean length of stay for each DRG plus the lesser of 28 days or 3.0 standard deviations and the cost outlier threshold at the greater of 2.0 times the prospective payment rate for the DRG or $34,000.

The final outlier adjustment factors for FY 1990 are as follows: Outlier Reduction Factors—Urban—.9436; Rural—.9782.

The 5.1 percent projection of outlier payments is based on covered days in the FY 1988 MEDPAR file and does not reflect the increase in outlier payments that will occur in FY 1990 as a result of the elimination of the day limitation on Medicare inpatient hospital services under section 101 of Pub. L. 100–360. Based on FY 1988 data currently available regarding noncovered days of hospital care furnished to Medicare beneficiaries under the benefit structure in effect prior to the effective date of Pub. L. 100–360, we estimate that outlier payment for the additional days of covered care will be about 1.3 percent of total DRG payments. By making an average 5.1 percent offset to the standardized amount in 1990 instead of the 6.4 percent that will actually be paid, we are ensuring that the additional benefits from Pub. L. 100–360 are financed out of additional Federal monies rather than through the updated standardized amounts and outlier funds. For a more detailed explanation of this adjustment made to account for the effect of section 101 of Pub. L. 100–360, see the September 30, 1988 final rule (53 FR 38519). In that rule, we requested comments on the methodology we were using to take the effects of section 101 of Pub. L. 100–360 into account. We are developing a final rule to respond to the comments received from the public; however, we are using the same methodology in FY 1990 as was used to make the adjustment in FY 1989.

Table 8 of section IV of this addendum updates the Statewide average cost-to-charge ratios for urban hospitals and for rural hospitals to be used in calculating cost outlier payments for those hospitals for which the intermediary is unable to compute a reasonable hospital-specific cost-to-charge ratio. Effective October 1, 1989, these Statewide average ratios replace the ratios published in the September 30, 1988 final rule (53 FR 38628). These average ratios will be used to calculate cost outlier payments for those hospitals for which the intermediary computes cost-to-charge ratios lower than 0.36 or greater than 1.23. This range represents 3.0 standard deviations (plus or minus) from the mean of the log distribution of cost-to-charge ratios for all hospitals. These revised parameters will be applied to all updates to hospital-specific cost-to-charge ratios based on cost report settlements occurring during FY 1990.

Comment: Several commenters objected to the current outlier thresholds and the split between cases paid using the cost outlier methodology and cases paid using the day outlier methodology. One commenter urged that we alter our outlier policy to favor cost outliers. Another commenter suggested that we favor day outliers.

Response: As we noted in the September 30, 1988 final rule (53 FR 38504), the 60 percent cost and 40 percent day outlier split results from the methodology used to pay the outlier cases and not on the threshold criteria. The percentage of payments for day outliers under the current outlier policy has increased relative to those under the policy in effect prior to FY 1989 since high cost day outlier cases are now paid using the cost outlier methodology. Further, we believe that the current outlier policy is still relatively new (it was implemented on November 1, 1988), and that more data are needed to analyze its impact. We will analyze these data as we receive them and reexamine our outlier policy if any adverse effects are detected.

The outlier thresholds essentially maintain the current outlier payment split with 34 percent of cases being paid using the cost outlier methodology and 66 percent using the day outlier methodology. We note that 14 percent of total outlier cases would meet the day outlier threshold but would be paid using the cost outlier methodology because it yields the higher payment. Our simulation of FY 1990 outlier payments based on FY 1988 Medicare provider analysis and review file (MEDPAR) data indicates that the percentage of cases that qualify as day outliers is about 80 percent.

The cases qualifying as day outliers are expected to receive 84 percent of outlier payments in FY 1990. An estimated 20 percent of outlier cases would be cost-only outlier cases, which are expected to receive about 16 percent of outlier payments. The following table illustrates this finding in greater detail:

Type of outlier	Percentage of outlier cases	Percentage of outlier payments
Meets day threshold only	56	28.3
Meets day and cost thresholds, paid using day methodology	10	17.9
Meets day and cost thresholds, paid using day methodology	14	37.8
Subtotal—All cases meeting day threshold	80	84
Meets cost threshold only	20	16
Total	100	100

Comment: Several commenters suggested that the size of the outlier payment pool be increased from 5.1 percent to the legal maximum of 6 percent so that the outlier thresholds could be lowered. Other commenters wanted to maintain the 5.1 percent pool. Still other commenters, while in favor of an increase in the outlier pool, suggested that it be done with no corresponding additional offsets to the prospective payment rates.

Response: Increasing the size of the outlier pool to six percent in order to reduce the outlier thresholds would increase the number of outlier cases, but it would also proportionately reduce the basic payment for all cases. In addition, as we have noted in previous prospective payment rules (most recently at 53 FR 38505; September 30, 1988), our research indicates that increasing the outlier pool to six percent would cause only a marginal decrease in the risk faced by hospitals under the prospective payment system. We continue to believe that it is desirable at this time to maintain a smaller outlier pool than the maximum six percent because it allows proportionately greater payment for typical cases.

If we were to increase the outlier pool from 5.1 percent to 6 percent without making a corresponding adjustment to the payment rates, we would be adding program funds to the prospective payment system above and beyond the update factor and, in doing so, would violate the restriction that outlier thresholds be set so as to ensure equality between outlier offsets and projected outlier payment, as required under the current law. Section 1886(d)(3)(B) of the Act mandates that outlier payments be financed out of the total payments made under the prospective payment system. Therefore, any increase in the amount of outlier payments will necessarily reduce funds available for typical cases.

Comment: A few commenters suggested that in fiscal years in which outlier payments have fallen short of the outlier reserve, these undisbursed funds should be paid to the hospitals.

Response: We have responded to similar comments in the September 3, 1986 final rule (52 FR 31525), the September 1, 1987 final rule (52 FR 33048), and the September 30, 1988 final rule (53 FR 38508). We are required by section 1886(d)(5)(A) of the Act to estimate, using the most recent data available, what the level of the outlier thresholds should be in order to yield the proper total amount of outlier payments. We believe we have consistently met our statutory obligation to ensure that the rate offsets used to finance outlier payments were equal to the estimated proportion of total prospective payments for outliers. We have used the most recent Medicare discharge data available to estimate total prospective payments and outlier payments as a percentage thereof. This is necessarily a prospective process and the resulting estimate may be inaccurate based on later data. We do not believe that payment or recoupment of outlier monies based on retrospective adjustments to the thresholds would be appropriate.

Although we overestimated the outlier pool in the first years of the prospective payment system and thus underestimated outlier payments, this has not been the case for the last few years. Based on the most recent billing data, we estimate that in FY 1988 outlier payments represented 6.7 percent of total prospective payment system payments which is 1.7 percent higher than the 5.0 percent outlier pool established for that year. We believe this discrepancy between outlier payments and the outlier pool resulted from the fact that the outlier thresholds established for FY 1988 assumed a 2.7 percent update to the prospective payment rates. However, this update was in effect for only 132 days of FY 1988 and was subsequently revised by the provisions of sections 4002 of Pub. L. 100–203. For FY 1989, we estimate that outlier payments will represent approximately 5.9 percent of total prospective payment system payments and will exceed the outlier pool of 5.1 percent by about 0.8 percent. If we were to make retroactive adjustments for incorrect outlier pool estimates as the commenters suggested, we would now be making reductions in prospective payments.

B. Adjustments for Area Wage Levels and Cost-of-Living

This section contains an explanation of the application of two types of adjustments to the adjusted standardized amounts that will be made by the intermediaries in determining the prospective payment rates as described in section II.D. of this addendum. For discussion purposes, it is necessary to present the adjusted standardized amounts divided into labor and nonlabor portions. Tables 1a, 1b, and 1c, as set forth in this addendum, contain the actual labor-related and nonlabor-related shares that will be used to calculate the prospective payment rates for hospitals located in the 50 States, the District of Columbia, and Puerto Rico.

1. Adjustment for Area Wage Levels

Sections 1886(d)(2)(H) and 1886(d)(9)(C)(iv) of the Act require that an adjustment be made to the labor-related portion of the prospective payment rates to account for area differences in hospital wage levels. This adjustment is made by the intermediaries by multiplying the labor-related portion of the adjusted standardized amounts by the appropriate wage index for the area in which the hospital is located. In section III of the preamble to this final rule, we discuss certain revisions we are making to the wage index. This index is set forth in Tables 4a, 4b, and 4c of this addendum

2. Adjustment for Cost of Living in Alaska and Hawaii

Section 1886(d)(5)(C)(iv) of the Act authorizes an adjustment to take into account the unique circumstances of hospitals in Alaska and Hawaii. Higher labor-related costs for these two States are taken account of in the adjustment for area wages above. For FY 1990, the adjustment necessary for nonlabor-related costs for hospitals in Alaska and Hawaii will be made by the intermediaries by multiplying the nonlabor portion of the standardized amounts by the appropriate adjustment factor contained in the table below.

TABLE OF COST-OF-LIVING ADJUSTMENT FACTORS, ALASKA AND HAWAII HOSPITALS

Alaska—All areas	1.25
Hawaii:	
Oahu	1.225
Kauai	1.175
Maui	1.20
Molokai	1.20
Lanai	1.20
Hawaii	1.15

(The above factors are based on data obtained from the U.S. Office of Personnel Management.)

C. DRG Weighting Factors

As discussed in section II of the preamble to this final rule, we have developed a classification system for all hospital discharges, sorting them into DRGs, and have developed weighting factors for each DRG that are intended to reflect the resource utilization of cases in each DRG relative to that of the average Medicare case.

Table 5 of section IV of this addendum contains the weighting factors that we will use for discharges occurring in FY 1990. These factors have been recalibrated as explained in section II.C. of the preamble to this final rule.

D. Calculation of Prospective Payment Rates for FY 1990

General Formula for Calculation of Prospective Payment Rates for FY 1990

Prospective Payment Rate for all hospitals located outside Puerto Rico except sole community hospitals = Federal Portion

Prospective Payment Rate for Sole Community Hospitals = 75 percent of the hospital-specific portion + 25 percent of Federal portion

Prospective Payment Rate for Puerto Rico Hospitals = 75 percent of the Puerto Rico rate + 25 percent of a discharge-weighted average of the large urban, other urban, and rural national rates

1. Federal Portion

For discharges on or after October 1, 1989 and before October 1, 1990, except for sole community hospitals and hospitals located in Puerto Rico, the hospital's rate is comprised exclusively of the Federal rate. The Federal rate is comprised of 100 percent of the Federal national rate except for those hospitals located in Census regions that have a regional rate that is higher than the national rate. The Federal rate for these hospitals equals 85 percent of the Federal national rate and 15 percent of the Federal regional rate. For discharges occurring on or after October 1, 1989 and before October 1, 1990, rural hospitals in regions I, II, III, and IV and urban and large urban hospitals in regions I, IV, and VI are affected by the regional floor. For sole community hospitals, the 25 percent Federal portion is based entirely on the Federal regional rate. The Federal rates are determined as follows:

Step 1—Select the appropriate regional or national adjusted standardized amount considering the type of hospital and designation of the hospital as large urban, other urban, or rural (see Tables 1a and 1b, section IV of this addendum).

Step 2—Multiply the labor-related portion of the standardized amount by the applicable wage index for the geographic area in which the hospital is located (see Tables 4a, 4b, and 4c, section IV of this addendum).

Step 3—For hospitals in Alaska and Hawaii, multiply the nonlabor-related portion of the standardized amount by the appropriate cost-of-living adjustment factor.

Step 4—Sum the amount from step 2 and the nonlabor portion of the standardized amount (adjusted if appropropriate under step 3).

Step 5—Multiply the final amount from step 4 by the weighting factor corresponding to the appropriate DRG (see Table 5, section IV of this addendum).

Step 6—For sole community hospitals, multiply the result in step 5 by 25 percent. The result is the Federal portion of the FY 1990 prospective payment for a given discharge for a sole community hospital.

2. Hospital-Specific Portion (Applicable Only to Sole Community Hospitals)

The hospital-specific portion of the prospective payment rate is based on a hospital's historical cost experience. For the first cost reporting period under prospective payment, a hospital-specific rate was calculated for each hospital, derived generally from the following formula:

$$\frac{\text{Base year costs per discharge}}{\text{1981 case-mix index}} \times \text{update factor} = \text{Hospital-specific rate}$$

For sole community hospitals, the hospital-specific portion equals 75 percent of the hospital-specific rate for all cost reporting periods beginning on or after October 1, 1983. For each subsequent cost reporting period, the hospital-specific portion is derived as follows:

Hospital-Specific Rate × Update Factor × DRG Weight × .75.

For a more detailed discussion of the hospital-specific portion, we refer the reader to the September 1, 1983 interim final rule (48 FR 39772).

a. *Updating the Hospital-Specific Rates for FY 1990 Cost Reporting Periods.* For cost reporting periods beginning on or after October 1, 1989, we are increasing the hospital-specific rates by 5.5 percent (the market basket percentage increase) for hospitals located in all areas. As required by section 1886(b)(3)(B) of the Act, this is the same percentage increase by which we are increasing the Federal rates for FY 1990.

b. *Calculation of Hospital-Specific Portion.* For sole community hospital cost reporting periods beginning on or after October 1, 1989 and before October 1, 1990, the hospital-specific portion of a hospital's payment for a given discharge is calculated by—

Step 1—Multiplying the hospital's hospital-specific rate for the preceding cost reporting period by the applicable update factor (that is, 5.5 percent);

Step 2—Multiplying the amount resulting from Step 1 by the specific DRG weighting factor applicable to the discharge; and

Step 3—Multiplying the result in step 2 by 75 percent. (The result is the hospital-specific portion of the FY 1990 prospective payment for a given discharge for a sole community hospital. The prospective payment rate is the sum of this amount and the 25 percent Federal portion, which is based entirely on the Federal regional rate.)

3. General Formula for Calculation of Prospective Payment Rates for Hospitals Located in Puerto Rico Beginning On or After October 1, 1989 and Before October 1, 1990

a. *Puerto Rico Rate.* Puerto Rico prospective payment rate is determined as follows:

Step 1—Select the appropriate adjusted average standardized amount considering the large urban, other urban, or rural designation of the hospital (see Table 1c, section IV of the addendum).

Step 2—Multiply the labor-related portion of the standardized amount by the appropriate wage index (see Tables 4a and 4b, section IV of the addendum).

Step 3—Sum the amount from step 2 and the nonlabor portion of the standardized amount.

Step 4—Multiply the result in step 3 by 75 percent.

Step 5—Multiply the amount from step 3 by the weighting factor corresponding to the appropriate DRG weight (see Table 5, section IV of the addendum).

b. *National Rate.* The national prospective payment rate is determined as follows:

Step 1—Multiply the labor-related portion of the national average standardized amount (see Table 1c, section IV of the addendum) by the appropriate wage index.

Step 2—Sum the amount from step 1 and the nonlabor portion of the national average standardized amount.

Step 3—Multiply the result in step 2 by 25 percent.

Step 4—Multiply the amount from step 3 by the weighting factor corresponding to the appropriate DRG weight (see Table 5, section IV of the addendum).

The sum of the Puerto Rico rate and the national rate computed above equals the prospective payment for a given discharge for a hospital located in Puerto Rico.

III. Target Rate Percentages for Hospitals and Hospital Units Excluded From the Prospective Payment System

The inpatient operating costs of hospitals and hospital units excluded from the prospective payment system are subject to rate-of-increase limits established under the authority of section 1886(b) of the Act, which is implemented in § 413.40 of the regulations. Under these limits, an annual target amount (expressed in terms of the inpatient operating cost per discharge) is set for each hospital, based on the hospital's own historical cost experience, trended forward by the applicable update factors. This target amount is applied as a ceiling on the allowable costs per discharge for the hospital's next cost reporting period.

A hospital that has inpatient operating costs per discharge in excess of its target amount would be paid no more than that amount. However, a hospital that has inpatient operating costs less than its target amount would be paid its cost plus the lower of (1) 50 percent of the difference between the inpatient operating cost per discharge and the target amount, or (2) 5 percent of the target amount.

Each hospital's target amount is adjusted annually, before the beginning of its cost reporting period, by an applicable target rate percentage. For cost reporting periods beginning on or after October 1, 1989 and before October 1, 1990, section 1886(b)(3)(B)(ii) of the Act provides that the applicable percentage increase is the market basket percentage increase. In order to determine a hospital's target amount for its cost reporting period beginning in FY 1990, the hospital's target amount for its reporting period that began in FY 1989 is increased by the market basket percentage for FY 1990. The most recent forecasted hospital market basket increase for FY 1990 is 5.5 percent. Therefore, the applicable percentage increase is also 5.5 percent.

Comment: We received one comment urging us to develop a separate market basket index for rehabilitation facilities.

Response: We agree that the development of a separate market basket for rehabilitation hospitals should be explored further. We are currently working with the National Association of Rehabilitation Facilities to develop data sources for constructing a market basket specific to those facilities. We intend to conduct an indepth analysis of this issue in conjunction with our overall rebasing of the hospital market basket for FY 1991 to determine whether separate market baskets should be established for hospitals and hospital units excluded from the prospective payment system.

IV. Tables

This section contains the tables referred to throughout the preamble to this proposed rule and in this addendum. For purposes of this proposed rule, and to avoid confusion, we have retained the designations of Tables 1 through 5 that were first used in the September 1, 1983 initial prospective payment final rule (48 FR 39844). Tables 1a, 1b, 1c, 3C, 4a, 4b, 4c, 5, 6a, 6b, 6c, 6d, 6e, 6f, 7A, 7B, and 8 are presented below. The tables are as follows:

Table 1a—National Adjusted Standardized Amounts, Labor/Nonlabor
Table 1b—Regional Adjusted Standardized Amounts, Labor/Nonlabor
Table 1c—Adjusted Standardized Amounts for Puerto Rico, Labor/Nonlabor
Table 3C—Hospital Case Mix Indexes for Discharges Occurring in Federal Fiscal Year 1988

TABLE 6A—NEW DIAGNOSIS CODES

Diagnosis Code	Description	DRG	CC
088.81	Lyme disease	423	No.
088.89	Other specified arthropod-borne diseases	423	No.
345.00	Generalized nonconvulsive epilepsy, without mention of intractable epilepsy	24, 25, 26	No.
345.01	Generalized nonconvulsive epilepsy, with intractable epilepsy	24, 25, 26	Yes.
345.10	Generalized convulsive epilepsy, without mention of intractable epilepsy	24, 25, 26	Yes.
345.11	Generalized convulsive epilepsy, with intractable epilepsy	24, 25, 26	Yes.
345.40	Partial epilepsy, with impairment of consciousness, without mention of intractable epilepsy	24, 25, 26	No.
345.41	Partial epilepsy, with impairment of consciousness, with intractable epilepsy	24, 25, 26	Yes.
345.50	Partial epilepsy, without mention of impairment of consciousness, without mention of intractable epilepsy	24, 25, 26	No.
345.51	Partial epilepsy, without mention of impairment of consciousness, with intractable epilepsy	24, 25, 26	Yes.
345.60	Infantile spasms, without mention of intractable epilepsy	24, 25, 26	No.
345.61	Infantile spasms, with intractable epilepsy	24, 25, 26	Yes.
345.70	Epilepsia partialis continua, without mention of intractable epilepsy	24, 25, 26	No.
345.71	Epilepsia partialis continua, with intractable epilepsy	24, 25, 26	Yes.
345.80	Other forms of epilepsy, without mention of intractable epilepsy	24, 25, 26	No.
345.81	Other forms of epilepsy, with intractable epilepsy	24, 25, 26	Yes.
345.90	Epilepsy, unspecified, without mention of intractable epilepsy	24, 25, 26	No.
345.91	Epilepsy, unspecified with intractable epilepsy	24, 25, 26	Yes.
403.00	Hypertensive renal disease, malignant, without mention of renal failure	331, 332, 333	Yes.
403.01	Hypertensive renal disease, malignant, with renal failure	316	Yes.
403.10	Hypertensive renal disease, benign, without mention of renal failure	331, 332, 333	No.
403.11	Hypertensive renal disease, benign, with renal failure	316	Yes.
403.90	Hypertensive renal disease, unspecified, without mention of renal failure	331, 332, 333	No.
403.91	Hypertensive renal disease, unspecified, with renal failure	316	Yes.
404.00	Hypertensive heart and renal disease, malignant, without mention of congestive heart failure or renal failure	134	Yes.
404.01	Hypertensive heart and renal disease, malignant, with congestive heart failure	124, 127	Yes.
404.02	Hypertensive heart and renal disease, malignant, with renal failure	316	Yes.
404.03	Hypertensive heart and renal disease, malignant, with congestive heart failure and renal failure	124, 127	Yes.
404.10	Hypertensive heart and renal disease, benign, without mention of congestive heart failure or renal failure	134	No.
404.11	Hypertensive heart and renal disease, benign, with congestive heart failure	124, 127	Yes.
404.12	Hypertensive heart and renal disease, benign, with renal failure	316	Yes.
404.13	Hypertensive heart and renal disease, benign, with congestive heart failure and renal failure	124, 127	Yes.
404.90	Hypertensive heart and renal disease, unspecified, without mention of congestive heart failure or renal failure	134	No.
404.91	Hypertensive heart and renal disease, unspecified, with congestive heart failure	124, 127	Yes.
404.92	Hypertensive heart and renal disease, unspecified, with renal failure	316	Yes.
404.93	Hypertensive heart and renal disease, unspecified, with congestive heart failure and renal failure	124, 127	Yes.
410.00	Acute myocardial infarction, of anterolateral wall, episode of care, unspecified	132, 133	No.
410.01	Acute myocardial infarction, of anterolateral wall, initial episode of care	115, 121, 122, 123	Yes.
410.02	Acute myocardial infarction, of anterolateral wall, subsequent episode of care	132, 133	No.
410.10	Acute myocardial infarction, of other anterior wall, subsequent episode of care unspecified	132, 133	No.
410.11	Acute myocardial infarction, of other anterior wall, initial episode of care	115, 121, 122, 123	Yes.
410.12	Acute myocardial infarction, of other anterior wall, subsequent episode of care	132, 133	No.
410.20	Acute myocardial infarction, of inferolateral wall, episode of care unspecified	132, 133	No.
410.21	Acute myocardial infarction, of inferolateral wall, initial episode of care	115, 121, 122, 123	Yes.
410.22	Acute myocardial infarction, of inferolateral wall, subsequent episode of care	132, 133	No.
410.30	Acute myocardial infarction, of inferoposterior wall, episode of care unspecified	132, 133	No.
410.31	Acute myocardial infarction, of inferoposterior wall, initial episode of care	115, 121, 122, 123	Yes.
410.32	Acute myocardial infarction, of inferoposterior wall, subsequent episode of care	132, 133	No.
410.40	Acute myocardial infarction, of other inferior wall, episode of care unspecified	132, 133	No.
410.41	Acute myocardial infarction, of other inferior wall, initial episode of care	115, 121, 122, 123	Yes.
410.42	Acute myocardial infarction, of other inferior wall, subsequent episode of care	132, 133	No.
410.50	Acute myocardial infarction, of other lateral wall, episode of care unspecified	132, 133	No.
410.51	Acute myocardial infarction, of other lateral wall, initial episode of care	115, 121, 122, 123	Yes.
410.52	Acute myocardial infarction, of other lateral wall, subsequent episode of care	132, 133	No.
410.60	Acute myocardial infarction, true posterior wall infarction, episode of care unspecified	132, 133	No.
410.61	Acute myocardial infarction, true posterior wall infarction, initial episode of care	115, 121, 122, 123	Yes.
410.62	Acute myocardial infarction, true posterior wall infarction, subsequent episode of care	132, 133	No.
410.70	Acute myocardial infarction, subendocardial infarction, episode of care unspecified	132, 133	No.
410.71	Acute myocardial infarction, subendocardial infarction, initial episode of care	115, 121, 122, 123	Yes.
410.72	Acute myocardial infarction, subendocardial infarction, subsequent episode of care	132, 133	No.

410.81	Acute myocardial infarction, of other specified sites, initial episode of care	115, 121, 122, 123	Yes.
410.82	Acute myocardial infarction, of other specified sites, subsequent episode of care	132, 133	No.
410.90	Acute myocardial infarction, unspecified site, episode of care unspecified	132, 133	No.
410.91	Acute myocardial infarction, unspecified site, initial episode of care	115, 121, 122, 123	Yes.
410.92	Acute myocardial infarction, unspecified site, subsequent episode of care	132, 133	No.
411.81	Acute ischemic heart disease without myocardial infarction	124, 140	Yes.
411.89	Other acute and subacute forms of ischemic heart disease	124, 140	Yes.
429.71	Acquired cardiac septal defect	124, 144, 145	Yes.
429.79	Other certain sequelae of myocardial infarction, not elsewhere classified	124, 144, 145	Yes.
493.20	Chronic obstructive asthma (with obstructive pulmonary disease), without mention of status asthmaticus	88	Yes.
493.21	Chronic obstructive asthma (with obstructive pulmonary disease), with status asthmaticus	88	Yes.
651.30	Twin pregnancy with fetal loss and retention of one fetus, unspecified as to episode of care or not applicable	469	No.
651.31	Twin pregnancy with fetal loss and retention of one fetus, delivered, with or without mention of antepartum condition	370, 371, 372, 373, 374, 375.	No.
651.33	Twin pregnancy with fetal loss and retention of one fetus, antepartum condition or complication	383, 384	No.
651.40	Triplet pregnancy with fetal loss and retention of one or more fetus(es), unspecified as to episode of care or not applicable.	469	No.

TABLE 6A—NEW DIAGNOSIS CODES—Continued

Diagnosis Code	Description	DRG	CC
651.41	Triplet pregnancy with fetal loss and retention of one or more fetus(es), delivered, with or without mention of antepartum condition.	370, 371, 372, 373, 374, 375.	No.
651.43	Triplet pregnancy with fetal loss and retention of one or more fetus(es), antepartum condition or complication	383, 384	No.
651.50	Quadruplet pregnancy with fetal loss and retention of one or more fetus(es), unspecified as to episode of care or not applicable.	469	No.
651.51	Quadruplet pregnancy with fetal loss and retention of one or more fetus(es), delivered, with or without mention of antepartum condition.	370, 371, 372, 373, 374, 375.	No.
651.53	Quadruplet pregnancy with fetal loss and retention of one or more fetus(es), antepartum condition or complication	383, 384	No.
651.60	Other multiple pregnancy with fetal loss and retention of one or more fetus(es), unspecified as to episode of care or not applicable.	469	No.
651.61	Other multiple pregnancy with fetal loss and retention of one or more fetus(es), delivered, with or without mention of antepartum condition.	370, 371, 372, 373, 374, 375.	No.
651.63	Other multiple pregnancy with fetal loss and retention of one or more fetus(es), antepartum condition or complication	383, 384	No.
759.81	Prader-Willi syndrome	390	No.
759.82	Marfan syndrome	390	No.
759.89	Other specified anomalies	390	No.
996.60	Infection and inflammatory reaction due to unspecified device, implant, and graft	452, 453	Yes.
996.61	Infection and inflammatory reaction due to cardiac device, implant, and graft	144, 145	Yes.
996.62	Infection and inflammatory reaction due to other vascular device, implant, and graft	144, 145	Yes.
996.63	Infection and inflammatory reaction due to nervous system device, implant, and graft	34, 35	Yes.
996.64	Infection and inflammatory reaction due to indwelling urinary catheter	331, 332, 333	Yes.
996.65	Infection and inflammatory reaction due to other genitourinary device, implant, and graft	331, 332, 333	Yes.
996.66	Infection and inflammatory reaction due to internal joint prosthesis	249	Yes.
996.67	Infection and inflammatory reaction due to other internal orthopedic device, implant, and graft	249	Yes.
996.69	Infection and inflammatory reaction due to other internal prosthetic device, implant, and graft	452, 453	Yes.
996.70	Other complications due to unspecified device, implant, and graft	452, 453	Yes.
996.71	Other complications due to heart valve prosthesis	144, 145	Yes.
996.72	Other complications due to other cardiac device, implant, and graft	144, 145	Yes.
996.73	Other complications due to renal dialysis device, implant, and graft	144, 145	Yes.
996.74	Other complications due to other vascular device, implant, and graft	144, 145	Yes.
996.75	Other complications due to nervous system device, implant, and graft	34, 35	Yes.
996.76	Other complications due to genitourinary device, implant, and graft	331, 332, 333	Yes.
996.77	Other complications due to internal joint prosthesis	249	Yes.
996.78	Other complications due to other internal orthopedic device, implant, and graft	249	Yes.
996.79	Other complications due to other internal prosthetic device, implant, and graft	452, 453	Yes.
V23.7	Insufficient prenatal care	469	Yes.
V30.00	Single liveborn, born in hospital, delivered without mention of cesarean section	391	No.
V30.01	Single liveborn, born in hospital, delivered by cesarean section	391	No.
V31.00	Twin, mate liveborn, born in hospital, delivered without mention of cesarean section	391	No.
V31.01	Twin, mate liveborn, born in hospital, delivered by cesarean section	391	No.
V32.00	Twin, mate stillborn, born in hospital, delivered without mention of cesarean section	391	No.
V32.01	Twin, mate stillborn, born in hospital, delivered by cesarean section	391	No.
V33.00	Twin, unspecified, born in hospital, delivered without mention of cesarean section	391	No.
V33.01	Twin, unspecified, born in hospital, delivered by cesarean section	391	No.
V34.00	Other multiple, mates all liveborn, born in hospital, delivered without mention of cesarean section	391	No.
V34.01	Other multiple, mates all liveborn, born in hospital, delivered by cesarean section	391	No.
V35.00	Other multiple, mates all stillborn, born in hospital, delivered without mention of cesarean section	391	No.
V35.01	Other multiple, mates all stillborn, born in hospital, delivered by cesarean section	391	No.
V36.00	Other multiple, mates live- and stillborn, born in hospital, delivered without mention of cesarean section	391	No.
V36.01	Other multiple, mates live- and stillborn, born in hospital, delivered by cesarean section	391	No.
V37.00	Other multiple, unspecified, born in hospital, delivered without mention of cesarean section	391	No.
V37.01	Other multiple, unspecified, born in hospital, delivered by cesarean section	391	No.
V39.00	Unspecified, born in hospital, delivered without mention of cesarean section	391	No.
V39.01	Unspecified, born in hospital, delivered by cesarean section	391	No.

TABLE 6B—NEW PROCEDURE CODES

Procedure Code	Description	DRG
11.75	Radial Keratotomy [1]	42; 442, 443
11.76	Epikeratophakia [1]	40, 41; 442, 443
31.95	Tracheoesophageal fistulization	Non-OR
32.01	Endoscopic excision or destruction of lesion or tissue of bronchus	Non-OR, 412
32.09	Other local excision or destruction of lesion or tissue of bronchus	75
32.28	Endoscopic excision or destruction of lesion or tissue of lung	Non-OR, 412
38.95	Venous catheterization for renal dialysis	Non-OR
42.33	Endoscopic excision or destruction of lesion or tissue of esophagus	Non-OR, 412
43.11	Percutaneous [endoscopic] gastrostomy [PEG]	Non-OR
43.19	Other gastrostomy	Non-OR
44.43	Endoscopic control of gastric or duodenal bleeding	Non-OR
44.44	Transcatheter embolization for gastric or duodenal bleeding	Non-OR
44.49	Other control of hemorrhage of stomach or duodenum	Non-OR
45.30	Endoscopic excision or destruction of lesion of duodenum	Non-OR, 412
45.43	Endoscopic destruction of other lesion or tissue of large intestine	Non-OR, 412
46.32	Percutaneous [endoscopic] jejunostomy [PEJ]	Non-OR
46.85	Dilation of colon	Non-OR
49.31	Endoscopic excision or destruction of lesion or tissue of anus	Non-OR, 412

TABLE 6B—NEW PROCEDURE CODES—Continued

Procedure Code	Description	DRG
49.39	Other local excision or destruction of lesion or tissue of anus	157, 158; 267
51.10	Endoscopic retrograde cholangiopancreatography [ERCP]	Non-OR, 412
51.14	Other closed [endoscopic] biopsy of biliary duct or sphincter of Oddi	Non-OR, 412
51.15	Pressure measurement of sphincter of Oddi	Non-OR
51.64	Endoscopic excision or destruction of lesion of biliary ducts or sphincter of Oddi	Non-OR, 412
51.84	Endoscopic dilation of ampulla and biliary duct	Non-OR, 412
51.85	Endoscopic sphincterotomy and papillotomy	Non-OR, 412
51.86	Endoscopic insertion of nasobiliary drainage tube	Non-OR, 412
51.87	Endoscopic insertion of stent (tube) into bile duct	Non-OR, 412
51.88	Endoscopic removal of stone(s) from biliary tract	Non-OR
52.13	Endoscopic retrograde pancreatography [ERP]	Non-OR, 412
52.14	Closed [endoscopic] biopsy of pancreatic duct	Non-OR, 412
52.21	Endoscopic excision or destruction of lesion or tissue of pancreatic duct	Non-OR, 412
52.22	Other excision or destruction of lesion or tissue of pancreas or pancreatic duct	191, 192; 292, 293
52.97	Endoscopic insertion of nasopancreatic drainage tube	Non-OR, 412
52.98	Endoscopic dilation of pancreatic duct	Non-OR, 412
57.17	Percutaneous cystostomy	Non-OR
57.18	Other suprapubic cystostomy	308, 309; 344, 345; 360; 400; 406, 407; 442, 443
77.56	Repair of hammer toe	225
77.57	Repair of claw toe	225
77.58	Other excision, fusion, and repair of toes	225; 442, 443
81.40	Repair of hip, not elsewhere classified	210, 211, 212; 442, 443
81.52	Partial hip replacement	209; 292, 293; 442, 443; 471
81.53	Revision of hip replacement	209; 292, 293; 442, 443; 471
81.54	Total knee replacement	209; 442, 443; 471
81.55	Revision of knee replacement	209; 442, 443; 471
81.56	Total ankle replacement	209; 442, 443; 471
81.57	Replacement of joint of foot and toe	225; 442, 443
81.72	Arthroplasty of metacarpophalangeal and interphalangeal joint without implant	7, 8; 228; 441
81.73	Total wrist replacement	209; 442, 443
81.74	Arthroplasty of carpocarpal or carpometacarpal joint with implant	7, 8; 228; 441
81.75	Arthroplasty of carpocarpal or carpometacarpal joint without implant	7, 8; 228; 441
81.80	Total shoulder replacement	209; 442, 443
88.97	Magnetic resonance imaging of other and unspecified sites	Non-OR
88.98	Bone mineral density studies [1]	Non-OR
89.10	Intracarotid amobarbital test	Non-OR
89.19	Video and radio-telemetered electroencephalographic monitoring	Non-OR
94.61	Alcohol rehabilitation	436
94.62	Alcohol detoxification	Non-OR
94.63	Alcohol rehabilitation and detoxification	437
94.64	Drug rehabilitation	436
94.65	Drug detoxification	Non-OR
94.66	Drug rehabilitation and detoxification	437
94.67	Combined alcohol and drug rehabilitation	436
94.68	Combined alcohol and drug detoxification	Non-OR
94.69	Combined alcohol and drug rehabilitation and detoxification	437
97.05	Replacement of stent (tube) in biliary or pancreatic duct	Non-OR
98.51	Extracorporeal shockwave lithotripsy [ESWL] of the kidney, ureter and/or bladder	Non-OR, 323
98.52	Extracorporeal shockwave lithotripsy [ESWL] of the gallbladder and /or bile duct [1]	Non-OR
98.59	Extracorporeal shockwave lithotripsy of other sites [1]	Non-OR

[1] These procedures are not covered under Medicare. See Medicare Coverage Issues Manual 35-54; 35-81 and 50-44. Procedures potentially classified under code 98.59 will be evaluated for Medicare Coverage as they are developed.

TABLE 6C—REVISED PROCEDURE CODE TITLES AND INCLUSION TERMS THAT AFFECT DRG ASSIGNMENT

Procedure Code	Description	DRG
38.93	Venous catheterization, not elsewhere classified	No change
43.41	Endoscopic excision or destruction of lesion or tissue of stomach	Non-OR; 412
45.31	Other local excision of lesion of duodenum	No change
45.41	Excision of lesion or tissue of larger intestine	No change
45.42	Endoscopic polypectomy of large intestine	Non-OR; 412
51.11	Endoscopic retrograde cholangiography [ERC]	Non-OR; 412
51.12	Percutaneous biopsy of gall-bladder or bile ducts	Non-OR
51.82	Pancreatic sphincterotomy	154, 155, 156; 191, 192; 442, 443
52.92	Cannulation of pancreatic duct	No change
52.93	Endoscopic insertion of stent (tube) into pancreatic duct [1]	Non-OR; 412
52.94	Endoscopic removal of stone(s) from pancreatic duct [1]	Non-OR
52.99	Other operation on pancreas, not elsewhere classified [1]	170, 171; 191, 192; 442, 443
57.19	Other cystostomy	308, 309; 442, 443
57.21	Vesicostomy	308, 309; 344, 345; 360; 400; 406, 407; 442, 443
57.22	Revision or closure of vesicostomy	308, 309; 344, 345; 365; 400; 406, 407; 442, 443
77.54	Excision or correction of bunionette	No change
81.02	Other cervical fusion, anterior technique	4; 214, 215; 442, 443

TABLE 6C—REVISED PROCEDURE CODE TITLES AND INCLUSION TERMS THAT AFFECT DRG ASSIGNMENT—Continued

Procedure Code	Description	DRG
81.03	Other cervical fusion, posterior technique	4; 214, 215; 442, 443
81.04	Dorsal and dorsolumbar fusion, anterior technique	4; 214, 215; 442, 443
81.05	Dorsal and dorsolumbar fusion, posterior technique	4; 214, 215; 442, 443
81.06	Lumbar and lumbosacral fusion, anterior technique	4; 214, 215; 442, 443
81.07	Lumbar and lumbosacral fusion, lateral transverse process technique	4; 214, 215; 442, 443
81.08	Lumbar and lumbosacral fusion, posterior technique	4; 214, 215; 442, 443
81.09	Refusion of spine, any level or technique	4; 214, 215; 442, 443
81.51	Total hip replacement	209; 442, 443; 471
81.59	Revision of joint replacement, not elsewhere classified	233, 234; 442, 443
81.71	Arthroplasty of metacarpophalangeal and interphalangeal joint with implant	7, 8; 228; 441
81.79	Other repair of hand, fingers, and wrist	7, 8; 228; 441
81.81	Partial shoulder replacement	209; 442, 443
81.84	Total elbow replacement	209; 442, 443
89.68	Monitoring of cardiac output by other technique	Non-OR

[1] The notes for code 52.99 were revised to include the open procedures formerly included in codes 52.93 and 52.94, thus adding 52.99 to DRGs 170 and 171.

TABLE 6D—EXPANDED DIAGNOSIS CODES THAT ARE NO LONGER ACCEPTED IN GROUPER [1]

Diagnosis Code	Description	DRG
088.8	Other specified arthropod-borne diseases	423
345.0	Generalized nonconvulsive epilepsy	24, 25, 26
345.1	Generalized convulsive epilepsy	24, 25, 26
345.4	Partial epilepsy, with impairment or consciousness	24, 25, 26
345.5	Partial epilepsy, without mention of impairment of consciousness	24, 25, 26
345.6	Infantile spasms	24, 25, 26
345.7	Epilepsia partialis continua	24, 25, 26
345.8	Other forms of epilepsy	24, 25, 26
345.9	Epilepsy, unspecified	24, 25, 26
403.0	Hypertensive renal disease, malignant	331, 332, 333
403.1	Hypertensive renal disease, benign	331, 332, 333
403.9	Hypertensive renal disease, unspecified	331, 332, 333
404.0	Hypertensive heart and renal disease, malignant	134
404.1	Hypertensive heart and renal disease, benign	134
404.9	Hypertensive heart and renal disease, unspecified	134
410.0	Acute myocardial infarction, of anterolateral wall	115, 121, 122, 123
410.1	Acute myocardial infarction, of other anterior wall	115, 121, 122, 123
410.2	Acute myocardial infarction, of inferolateral wall	115, 121, 122, 123
410.3	Acute myocardial infarction, of inferoposterior wall	115, 121, 122, 123
410.4	Acute myocardial infarction, of other inferior wall	115, 121, 122, 123
410.5	Acute myocardial infarction, of other lateral wall	115, 121, 122, 123
410.6	True posterior wall infarction	115, 121, 122, 123
410.7	Acute myocardial infarction, subendocardial infarction	115, 121, 122, 123
410.8	Acute myocardial infarction of other specified sites	115, 121, 122, 123
410.9	Acute myocardial infarction, unspecified site	115, 121, 122, 123
411.8	Other acute and subacute forms of ischemic heart disease, unspecified	124, 140
759.8	Other specified congenital anomalies	390
996.6	Infection and inflamatory reaction due to internal prosthetic device, implant, and graft	452, 453
996.7	Other complications of internal prosthetic device, implant, and graft	452, 453
V30.0	Single liveborn, born in hospital	391
V31.0	Twin, mate liveborn, born in hospital	391
V32.0	Twin, mate stillborn, born in hospital	391
V33.0	Twin, unspecified, born in hospital	391
V34.0	Other multiple, mates all liveborn, born in hospital	391
V35.0	Other multiple, mates all stillborn, born in hospital	391
V36.0	Other multiple, mates live- and stillborn, born in hospital	391
V37.0	Other multiple unspecified, born in hospital	391
V39.0	Liveborn unspecified, born in hospital	391

[1] See Table 6a for New Diagnosis Codes (5 digits).

TABLE 6E—DELETED PROCEDURE CODES

Procedure Code	Description	DRG
32.0	Local excision or destruction of lesion or tissue of bronchus	75
43.1	Temporary gastrostomy	Non-OR
43.2	Permanent gastrostomy	Non-OR
49.3	Local excision or destruction of other lesion or tissue of anus	157, 158; 267
51.97	Therapeutic endoscopic procedures on biliary tract, oral route	Non-OR
52.2	Local excision or destruction of pancreatic lesion	191, 192; 292, 293
52.91	Endoscopic retrograde cannulation of pancreatic duct [ERCP]	Non-OR
98.95	Extracorporeal shockwave lithotripsy [ESWL]	Non-OR
81.18	Other fusion of toe	225; 442, 443
81.31	Arthroplasty of foot and toe with synthetic prosthesis	7, 8; 225; 442, 443
81.39	Other arthroplasty of foot and toe	7, 8; 225; 442, 443

TABLE 6E—DELETED PROCEDURE CODES—Continued

Procedure Code	Description	DRG
81.41	Total knee replacement	209; 442, 443; 471
81.48	Total ankle replacement	209; 442, 443; 471
81.61	Replacement of head of femur with use of methyl methacrylate	209; 292, 293; 442, 443; 471
81.62	Other replacement of head of femur	209; 292, 293; 442, 443; 471
81.63	Replacement of acetabulum with use of methyl methacrylate	209; 442, 443; 471
81.64	Other replacement of acetabulum	209; 442, 443; 471
81.69	Other repair of hip	210, 211, 212; 442, 443
81.86	Arthroplasty of carpals with synthetic prosthesis	7, 8; 228; 441
81.87	Other repair of wrist	7, 8; 228; 441
88.99	Magnetic resonance imaging of other and unspecified sites	Non-OR

BILLING CODE 4120-03-M

Table 6f --Additions to the CC Exclusions List

CCs that are added to the list are in Table 6f--Additions to the CC Exclusions List. Each of the principal diagnoses is shown with an asterisk, and the revisions to the CC Exclusions List are provided in an indented column immediately following the affected principal diagnosis.

Table 6q --Deletions to the CC Exclusions List

CCs that are deleted from the list are in Table 6g--Deletions to the CC Exclusions List. Each of the principal diagnoses is shown with an asterisk, and the revisions to the CC Exclusions List are provided in an indented column immediately following the affected principal diagnosis.

Appendix A—Regulatory Impact Analysis

I. Introduction

Executive Order (E.O.) 12291 requires us to prepare and publish a regulatory impact analysis for any final rule that meets one of the E.O. criteria for a "major rule"; that is, that will be likely to result in—

- An annual effect on the economy of $100 million or more;
- A major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions; or
- Significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

In addition, we generally prepare a regulatory flexibility analysis that is consistent with the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 through 612), unless the Secretary certifies that a final rule will not have a significant economic impact on a substantial number of small entities. For purposes of the RFA, we consider all hospitals to be small entities.

Also, section 1102(b) of the Act requires the Secretary to prepare a regulatory impact analysis for any final rule that may have a significant impact on the operations of a substantial number of small rural hospitals. Such an analysis must conform to the provisions of section 604 of the RFA. With the exception of hospitals located in certain rural counties adjacent to urban areas, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital with fewer than 50 beds located outside of a Metropolitan Statistical Area or New England County Metropolitan Area, as modified, for purposes of the prospective payment system, by section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21). Section 1886(d)(8)(B) of the Act specifies that hospitals located in certain rural counties adjacent to one or more urban areas are deemed to be located in the adjacent urban area. We have identified 52 rural hospitals, some of which may be considered small, that we are classifying as urban hospitals.

It is clear that the changes being implemented in this document will affect both a substantial number of small rural hospitals as well other classes of hospitals, and the effects on some will be significant. Therefore, the discussion below, in combination with the rest of this final rule, constitutes a combined regulatory impact analysis and regulatory flexibility analysis in accordance with E.O. 12291, the RFA, and section 1102(b) of the Act.

Since we have not significantly altered our final policy from the proposed, the impact of this final rule will be virtually identical to the impact presented in our initial analysis. The only differences in this final analysis from the initial impact analysis are to reflect the availability of more recent data since publication of the proposed rule, and the receipt of public comments directed specifically at the initial impact analysis. Thus, the following analysis revises those portions of the initial impact analysis that are affected by the availability of more recent and complete data and responds to the two comments that concerned the impact analysis.

II. Impact on Excluded Hospitals and Units

As of August 15, 1989, over 930 Medicare hospitals and nearly 1,700 units in hospitals included in the prospective payment system currently are paid on a reasonable cost basis subject to the rate-of-increase ceiling requirement of § 413.40. For cost reporting periods beginning in FY 1990, these hospitals will have their individual target amounts increased by the hospital market basket percentage increase. We are projecting an increase in the hospital market basket of 5.5 percent.

The effect this will have on affected hospitals and units will vary depending on each hospital's or unit's existing relationship of costs per discharge to its target amount, and the relative gains in productivity (efficiency) the hospital or unit is able to achieve. For hospitals and units that incur per discharge costs lower than their target amounts, the primary impact will be on the level of incentive payments made under § 413.40(d). A hospital may receive incentive payments for incurring costs that are lower than its target amount, but may not receive payments for costs that exceed the target amount. We expect the increased ceiling on payments would maintain existing incentives for economy and efficiency experienced by excluded hospitals and units.

III. Analysis of the Quantifiable Impact of Changes Affecting Rates and Payment Amounts

A. Basis and Methodology of Estimates

The data used in developing the following quantitative estimates of changes in payments presented in Table I, below, are taken from FY 1988 billing data and hospital-specific data for FY 1986 and FY 1987. Our initial impact analysis used FY 1988 MEDPAR data received through December 1988 (approximately 9.7 million discharges). This final analysis relies on FY 1988 MEDPAR data received through June 1989 (approximately 10 million discharges). Also, for purposes of the final impact analysis, we have excluded the 37 Indian Health Service hospitals that receive payments under the prospective payment system from our hospital data base. These hospitals receive their own wage index and are subject to special payment policies not applicable to any other group of hospitals under the prospective payment system. Because payments to these hospitals are not representative of payments to other hospitals, including them in the impact analysis produces some distortions in our quantitative analysis. By removing them from the data base, we believe the resulting impact estimates will more accurately reflect the effect on the remainder of the prospective payment hospitals of the policy changes being implemented.

With the exception of these changes in our analytical methodology, we are conducting the same analysis in this final rule as we performed in the initial analysis. As in the initial analysis, we compare the effects of changes being implemented in this document for FY 1990 to our estimate of the payment amounts in effect for FY 1989. In addition, we have treated all hospitals in our data base as if they had the same cost reporting period; that is, a cost reporting period coinciding with the Federal fiscal year. Furthermore, our model does not take into account any prospective, behavioral changes in response to this final rule.

The tables and the discussion that follow reflect our best effort to identify and quantify the effects of the changes set forth in this document. It should be noted, however, that as a result of gaps in our data, we are unable to quantify some of the effects of the proposed rule. Also, we could not use all the hospitals in the recalibration of outlier data sets for modeling the impact analysis because in some cases the hospital-specific data necessary for constructing our impact model were missing. Data on hospital bed size and type of ownership were the data elements most frequently missing. The absent data prevented us from properly classifying and displaying these hospitals in the impact analysis. The missing data, however, did not prevent us from using the discharges from these hospitals in recalibrating the DRG weights or calculating the outlier payments that are included in the final column of Table I showing the combined effects of all changes.

The following analysis examines the changes being implemented to the DRG weights and wage index separately. That is, all variables except those associated with the provision under examination were held constant so as to display the effects of each provision compared to the baseline (FY 1989) provisions. In the last column (column 3), we present the combined effect of all changes being implemented in this rule. That is, column 3 displays the combined effects of the previous two columns as well as the FY 1990 update factor and the updating of the outlier payment thresholds. As such, this last column is the only one in which the effects of all the quantifiable payment policy changes on simulated FY 1990 payments are reflected.

Consistent with the display of the impact presented in Table I, the following discussion is divided into two parts. The first part (columns 1 and 2) describes the effects of two major changes in this document: the annual changes to the DRG classification system and recalibration of the DRG weights required under section 1886(d)(4)(C) of the Act (including the adjustment for increased case mix); and replacement of the current wage index based on an equal blend of 1982 and 1984 wage data with a wage index based on 1984 wage data. The final section discusses the combined effect of all provisions of this rule.

Comment: One commenter suggested that the impact analysis include the effect of regulatory changes on payment to hospitals with varying proportions of Medicare utilization.

Response: We agree with the commenter that such an analysis would be useful and we have incorporated Medicare utilization as a category in our impact tables.

Comment: A few commenters suggested refining the impact analysis to include not only the effect of regulatory actions on payments to various classes of hospitals, but also the effect on hospital operating margins.

Response: To date, our analytical efforts have been retrospective in nature; that is, they are concerned with examining the historical record in efforts to trace the impact of the prospective payment system through perceived changes in hospital behavior. Any efforts to predict providers' response to the changes in payment rules contained in this document would take the form of speculation rather than rigorous analytical prediction. Because of limited data, we are confined to making general statements based on reasoned judgment as to the impact of specific policy changes. Since we cannot predict how hospitals will change their behavior in response to these rules, we do not believe that we can reliably project future hospital profit margins based on the data available to us.

For example, we use FY 1988 billing data to estimate the impact of changes in FY 1990 payments. The latest cost data available for predicting FY 1990 profit margins are from FY 1987. Therefore, provider behavior changes in the recent past are not yet reflected in the data available to us, and future changes cannot be predicted. Moreover, our objective in an impact analysis is to access the probable direct consequences of changes being proposed or issued in final, not to evaluate the overall effects of the prospective payment system or to compare payments to expected costs.

In view of the problems we have experienced in quantifying impacts and attributing causality, we believe the approach we are taking in the impact analysis of measuring expected impacts on hospital payments is the most feasible one. We do not believe that we can reliably predict the impact of prospective payment system changes on future hospital profit margins. Therefore, we have focused our analysis on explaining the anticipated changes in hospital payment levels and the decisions that affected entities will have to consider.

TABLE I—IMPACT OF THE CHANGES BEING IMPLEMENTED IN THE PROSPECTIVE PAYMENT SYSTEM FOR FY 1990

[1] Because data necessary to classify some hospitals by category were missing, some hospitals were omitted from the analysis. Therefore, the total number of hospitals in each category may not equal the national total. Also, we have excluded Indian Health Service hospitals from our analysis because they are paid under special payment policies not applicable to any other hospitals under the prospective payment system.

[2] Recalibration of the DRG weights and classification changes are based on FY 1988 MEDPAR data and are performed annually in accordance with section 1886(d)(4)(C) of the Act. This column reflects the −1.22 percent adjustment in the DRG weights for the increase in the case-mix index attributable to DRG reclassification and recalibration. The −1.22 adjustment has a uniform impact on all hospitals.

[3] The wage index constructed entirely from 1984 hourly wage data was compared to the current wage index which is based on a blend of 1982 and 1984 data. The wage index also reflects changes required by section 1886(d)(8)(C) of the Act (which was added by section 8403(a) of Pub. L. 100–647). This provision requires the Secretary to compute a separate wage index value for an urban or rural area if the wage index value for that area was reduced as a result of deeming the hospitals in certain rural counties as urban in accordance with section 1886(d)(8)(B) of the Act.

[4] This column shows the combined effects of all the previous columns as well as the effects of updating the FY 1989 standardized payment amounts by the market basket increase as mandated by section 1886(b)(3)(B)(ii) of the Act. Also, FY 1989 baseline payments reflect an estimate of outlier payments at 5.7 percent in contrast to the 5.1 percent set for the outlier pool. This estimate of payments from the outlier pool is exclusive of the approximately 1.0 percent additional outlier payments that result from the elimination of the day limitation on inpatient hospital services under Pub. L. 100–360. Because our total FY 1990 estimated payments do not perpetuate this 0.6 percent excess of outlier payments relative to the outlier pool, this column reflects the 0.6 percent reduction in total prospective payments necessary to ensure equality between projected outlier payments and the outlier offsets. In addition, this column captures certain interactive effects that we are not able to quantify.

B. Changes to the DRG Classification System and Recalibration of the DRG Weights, and Changes to the Wage Index

In Column 1, we present the combined effects of revising the current DRG definitions and recalibrating the weights to reflect changes in practice patterns, modes of treatment, and new technologies as required each year by section 1886(d)(4)(c) of the Act. These changes are described in section II.C. of the preamble to this rule. (The DRGs that have been recalibrated for this analysis also reflect, insofar as possible, the changes to the DRG classification system set forth in section II.B. of the preamble of this final rule.) As part of recalibrating and normalizing the DRG weights, we are adjusting all the DRG weights to correct for increases in the average case-mix index that have resulted from past GROUPER modifications. As explained in detail in section II.C. of the preamble to this final rule, we are reducing each DRG weight by 1.22 percent over what it would have been without this adjustment. Thus, in the following analysis, we compared estimated FY 1989 hospital payments using an estimate of each hospital's case-mix index based on the current DRG classifications and weighting factors to FY 1989 simulated payments using an estimate of each hospital's case-mix index based on the new DRG classifications and recalibrated weighting factors.

Nationally, revision to the DRG weights being implemented for FY 1990, with all other variables held constant, produce a 1.1 percent decrease in payments per case. However, within certain census divisions and among certain types of hospitals, DRG reclassification and recalibration appears to have a differential impact on hospital payments as a result of shifts in the relative weights among DRGs. In analyzing these shifts, we found that the DRGs with increased relative weights tended to be more expensive initially (higher weighted) than the DRGs with decreased relative weights. Since rural hospitals have a lower case mix, one result is that the average case weight for rural hospitals will decrease relative to the average case weights for urban hospitals. Consequently, reclassifiying and recalibrating DRGs will have a disproportionate impact on rural hospitals. The average reduction in payments to rural hospitals will be about 1.7 percent compared to an average reduction of about 1.0 percent for urban hospitals when we hold other payment variables constant. Holding all other payments variables constant, rural hospitals with fewer than 50 beds will experience a reduction in payments of 2.2 percent. Holding all other payment variables constant, sole community hospitals and other rural hospitals would experience payment reductions of about 1.4 percent.

The fact that DRG reclassification and recalibration has the greatest impact on small rural hospitals and sole community hospitals may explain the larger than average reductions for rural hospitals in the West North Central and West South Central census divisions. The majority of small hospitals and sole community hospitals are located in these areas.

Column 2 of Table II displays the estimated effects of changes to the wage index in this rule. As discussed in section III of the preamble, we are basing the wage index required under section 1886(d)(3)(E) and 1886(c)(9)(B)(vi) of the Act entirely on 1984 gross hourly wage data rather than on an equal blend of an index based on 1982 data and one based on 1984 data (as described in section III.B. of the preamble to this final rule). The wage index values also reflect changes required by section 1886(d)(8)(C) of the Act (which was added by section 8403(a) of the Technical and Miscellaneous Revenue Act of 1988 (Pub. L. 100–647)). This provision requires the Secretary to compute a separate wage index value for an urban or rural area if the wage index value for that area was reduced as a result of deeming hospitals in certain rural counties as urban in accordance with section 1886(d)(8)(B) of the Act (see section III.C. of the preamble to this final rule).

The changes to the wage index will have no significant effect on overall payments. The effect on hospitals in different geographic areas varies from an average 0.6 increase in payments for hospitals in the urban areas of the New England census division to a 0.7 reduction in payments for hospitals located in the urban localities of the East North Central census division. Generally, the new wage index changes will have the same effect on the overall distribution of payments to other urban and rural hospitals. The changes to the wage index will have slight effect on rural hospitals with fewer than 50 beds equal to the effect on all hospitals.

C. Combined Effects

Column 3 of Table I shows the FY 1990 rates that incorporate the combined effects of all the changes we are able to quantify. In addition to the changes described in columns 1 and 2, column 3 reflects the update factors mandated under section 1886(b)(3)(B)(i) of the Act.

Because Column 3 combines the FY 1990 payment rates and all other changes, the effects displayed also include the payment offset for outlier payments required under section 1886(d)(5)(A)(iv) of the Act. This provision requires that total outlier payments should not be less than five percent nor more than six percent of total prospective payments. In our analysis, similar to the analysis for FY 1989, we have set outlier thresholds and offset urban and rural rates for outliers so as to yield estimated outlier payments for FY 1989 equal to 5.1 percent of total DRG payments. In addition, sections 1886(d)(3)(B) and (d)(9)(b)(iv) of the Act requires that the urban and rural rates be offset by the same percentage of total payments that are outlier payments for urban and rural hospitals, respectively. Based on the most recent discharge data available, however, we anticipate that total outlier payments for FY 1989 (exclusive of the impact of the Medicare Catastrophic Coverage Act of 1988 (Pub. L. 100–360)) will equal 5.7 percent of total prospective payments, instead of the 5.1 percent accounted for by the offsets to the current rates. Therefore, column 3 also reflects a reduction of 0.6 percent in payments compared to FY 1989 payments because the FY 1989 baseline payments are overstated by the 0.6 percent outlier payments in excess of the outlier offsets reflected in the FY 1989 standardized amounts. The 5.7 percent estimate of payments from the outlier pool is exclusive of the additional outlier payments that result from the elimination of the limitation on inpatient hospital services under section 101 of Pub. L. 100–360. Outlier payments resulting from the provisions of Pub. L. 100–360 are estimated at 1.0 percent of total DRG payments, resulting in an estimated 6.7 percent in total FY 1989 outlier payments. We estimate that the additional outlier payments resulting from the changes made by Pub. L. 100–360 will be 1.3 percent in FY 1990 and will result in FY 1990 outlier payments equal to 6.4 percent of total DRG payments.

Nationally, the effects of all changes we are making are expected to result in a 3.7 percent payment increase. Geographically, hospitals in rural areas of the South Atlantic census division and urban localities in the West South Central census division will receive the largest percentage increase in prospective payments of 4.3 percent. However, hospitals in rural areas of the Pacific census division and urban

BEST COPY AVAILABLE

hospitals in the East North Central census division could expect only a 3.1 percent increase over FY 1989 payments.

Generally, urban hospitals will receive a payment increase averaging 3.7 percent (the national average) while the average increase for all rural hospitals would be 3.5 percent. Among rural hospitals, it appears that hospitals with over 200 beds would receive an increase in payments of 4.2 percent while hospitals with fewer than 50 beds would receive an increase of about 3.0 percent.

Among the different types of hospitals, rural referral centers will receive the largest increase in payments (5.2 percent) while disproportionate share hospitals located in rural areas will receive the smallest payment increase (2.8 percent). Sole community hospitals will receive an increase of about 3.4 percent. Type of ownership does not appear to be a factor influencing payment increases. Hospitals grouped by type of control (voluntary, proprietary and government) would receive payment increases at or near the national average percentage increase. Hospitals that have high Medicare utilization (hospitals with more than 65 percent Medicare patient days) can expect an average payment increase of about 3.5 percent while hospitals with between 25 and 50 percent Medicare patients days can expect an average payment increase of about 3.8 percent.

We must point out that there are interactions that result from the combining of the various separate provisions analyzed in the previous columns that we are unable to isolate. Thus, the values appearing in column 3 do not represent merely the additive effects of the previous columns plus the update factors.

Table II presents the projected FY 1990 average payments per case for urban and rural hospitals and for the different categories of hospitals shown in Table I, and compares them to the average estimated per case payments for FY 1989. As such, this table presents the combined effects of the changes presented in Table I in terms of the average dollar amounts paid per discharge. That is, the percentage change in average payments from FY 1989 to FY 1990 equals the percentage changes shown in the last column of Table I.

TABLE II.—COMPARISON OF PAYMENT PER CASE

[FY 1990 Compared to FY 1989]

	Number of hospitals	Average FY 1989 payment per case (1)	Average FY 1990 payment per case (2)	Percentage Change[1] (3)
All Hospitals	5,557	4,596	4,767	3.7

[1] Percentage changes shown in this column are taken from Table I, column 3. Because the dollar amounts shown in this table are rounded to the nearest dollar, percentage changes computed on the basis of these amounts will differ slightly from those displayed in this column.

Appendix B—Final Recommendation of Update Factors for Rates of Payment for Inpatient Hospital Services

Section 1886(e)(4) of the Act, as amended by section 4002(f) of Pub. L. 100–203, requires that the Secretary, taking into consideration the recommendations of ProPAC, recommend update factors for FY 1990 that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Section 1886(e)(4) of the Act also applies to the target rate-of-increase limits for hospitals excluded from the prospective payment system.

As required by section 1886(e)(5) of the Act, we published the initial recommended FY 1990 update factors that are provided for under section 1886(e)(4) of the Act as Appendix C of the proposed rule (54 FR 19747). We recommended that the prospective payment rates be increased, on average, by an amount equal to the market basket percentage increase minus 1.5 percentage points. Based on the forecasted hospital market basket increase at the time the proposed rule was published, that is, 5.8 percent, the recommended update was 4.3 percent on average.

However, in making that recommendation, we stated that differential updates for hospitals in rural, large urban, and other urban areas would be more appropriate than a uniform update to the payment amounts. Therefore, we strongly recommended a higher update for hospitals located in rural areas. We also recommended that hospitals located in large urban areas receive a higher update than hospitals located in other urban areas. In addition, we recommended a higher update to the target rate-of-increase limits for hospitals excluded from the prospective payment system than the average update of the market basket increase minus 1.5 percentage points.

In recommending these increases, we took into account the requirement in section 1886(e)(4) of the Act that the amounts be high enough to ensure the efficient and effective delivery of medically appropriate and necessary care of high quality. In addition, as required by section 1886(e)(4) of the Act, we addressed ProPAC's Recommendations 1 through 7, which concern updating the standardized amounts and the rate-of-increase limits. Also, we requested public comment on our recommendation.

We note that although we recommended appropriate update factors, requested and received public comments on these recommendations, and are providing a final recommendation, Congress actually prescribed the update factors to be used in FY 1990 in section 1886(b)(3)(B)(i) of the Act, as amended by section 4002(a) of the Omnibus Budget Reconciliation Act of 1987 (Pub. L. 100–203). That is, as explained in the addendum to this final rule, the applicable percentage increase for FY 1990 for inpatient hospital services for hospitals subject to the prospective payment system is equal to the market basket rate of increase forecasted for FY 1990. The most recent forecasted hospital market basket increase for FY 1990 is 5.5 percent. Therefore, the applicable percentage increase for prospective payment hospitals is 5.5 percent.

For cost reporting periods beginning on or after October 1, 1989, and before October 1, 1990, section 1886(b)(3)(B)(ii) of the Act, as amended by section 4002(e) of Pub. L. 100–203, provides that the applicable percentage increase for hospitals and hospital units excluded from the prospective payment system equals the hospital market basket rate of increase. As noted above, the most recent forecasted market basket increase is 5.5 percent; therefore the increase in these hospitals and hospital units target rate is also 5.5 percent.

We received several items of correspondence during the public comment period concerning our initial recommendation. After consideration of all the arguments presented, we have decided that our final recommendation will be the same as our initial recommendation. That is, we recommend that, on average, all hospitals receive an update in their payments for FY 1990 equal to the market basket percentage increase minus 1.5 percentage points. Based on the most recent forecasted hospital market basket increase of 5.5 percent, our recommended update is 4.0 percent on average.

To date, our analyses indicate that, while hospitals nationally continued to have positive Medicare operating margins on average in the fourth year of the prospective payment system, these levels have fallen from the high operating margins experienced in the first 2 years of that system. For this reason, we believe a prospective payment system update somewhat higher than the updates in past years is generally appropriate in order to ensure the availability of high quality care to Medicare beneficiaries. However, we believe that an average update factor lower than the market basket rate of increase is needed to continue to encourage hospitals to better control their costs.

Although we are recommending an update that averages the market basket percentage increase minus 1.5 percentage points for all prospective payment system hospitals, we recommend differentiation of the update according to the geographic classification of the hospital. We strongly recommend a higher update for hospitals located in rural areas. We also recommend that hospitals located in large urban areas (that is, those with a population exceeding 1,000,000) receive a higher update than hospitals located in other urban areas.

We are recommending differential updates based on geographic classification of hospitals as a result of our research on hospitals Medicare operating margins and our analysis of the impact the FY 1990 rates (based on a uniform update) will have on hospitals. While overall margins in FY 1987, the latest period for which we have complete data, were 5.3 percent, we found a disparity between urban and rural margins. Urban hospitals had FY 1987 inpatient Medicare operating margins of 6.3 percent. Rural hospital operating margins were −0.2 percent. Further, rural hospitals under 50 beds, which constitute 40 percent of rural hospitals, experienced, on average, operating margins of −2.9 percent. Because of our concerns with respect to the financial viability of rural hospitals, we believe that a higher update is appropriate. For hospitals in large urban areas, our data suggest that inpatient operating margins are declining as compared to the operating margins of hospitals in other urban areas, although such margins remain positive. For FY 1987, our data indicate that hospitals in large urban areas experienced margins of 5.8 percent as compared to 6.8 percent for hospitals in other urban areas. In view of the differences between costs per case and payments per case and the lower average Medicare operating margins in large urban areas, we believe that hospitals in large urban areas should receive a higher update than hospitals in other urban areas.

The FY 1990 rates are based on a uniform update equal to the percentage increase in the market basket, currently estimated at 5.5 percent. However, because of changes to the DRG weights and the wage index, as well as a reduction in outlier payments over current estimated FY 1989 levels, the FY 1990 rates will have a differential impact on hospitals according to geographic location. The net effect of all changes would be to increase payments to rural hospitals by 3.5 percent, to large urban hospitals by 3.6 percent, and to other urban hospitals by 3.9 percent. The net effect of all changes in this final rule, including the current law update, is a differential impact that is the opposite of the impact that would be appropriate based on the analysis of Medicare operating margins. Implementation of a higher update for rural hosptials and for large urban hosptials would reverse this effect.

Comment: Some commenters expressed concern that the update factor recommended by the Secretary did not include a discussion or presentation of the data used to form the basis of our recommendation and that the Secretary's recommendation was driven purely by budgetary requirements.

Response: While we have recommended an update to the prospective payment rates that is consistent with the Administration's budget proposal, our recommendation has analytic support. As in the past, we view the factors to be considered by the Secretary as a combination of hospital inputs, outputs, and outcomes.

The technical factors associated with the input and output portions of the update that we have considered include such items as the input costs faced by hospitals (that is, the hosptial market basket), hospital productivity, advances in science and technology, and changes in the nature of the practice patterns in hosptials. The productivity measure represents a future-oriented standard that incorporates expected savings based on established productivity goals. At the beginning of the prospective payment system update process, HCFA established a conservative standard for hospital productivity increase of 1.0 percent per year and, therefore, used a −1.0 percent adjustment for productivity increases. In the short run, any increases in productivity in excess of 1.0 percent would be kept by hospitals as increases in the operating margin. Increases in productivity of less than 1.0 percent would be discouraged by this standard as it affects hospital payment rates. Hospitals have made substantial increases in productivity since the implementation of the prospective payment system, and we believe that productivity gains can and should continue.

With respect to technological advances, we have relied on the results of several studies. ProPAC's study on the operating costs of new science and technology indicated that most new technologies are substitutes for old technologies and in many cases are less expensive. Other studies have shown the cost of the top 100 technologies to be relatively small in the absolute. While it appears that new devices and diagnostic procedures tend to have only a small impact on overall hospital costs, we believe it is appropriate to encourage hospitals to use health-enhancing new technologies and that a small adjustment for new technologies is appropriate.

We continue to measure for practice pattern changes based on changes in average length of stay since the beginning of the prospective payment system. We note that this represents a crude measure that does not capture all changes in practice patterns that have occurred. Average length of stay declined dramatically during the first years of the prospective payment system, but has gradually increased in the last few years. However, we believe an adjustment of as much as −0.64 percent for cumulative changes in practice patterns would be appropriate.

We have not developed an adjustment for case-mix changes as part of our recommended update because of the inherent difficulties in measuring real case-mix changes versus coding improvements. While average case mix continues to increase, we recognize that much of the upcoding noted in earlier years has leveled off. However, we agree with ProPAC's assessment that not all of the case-mix increase is attributable to increases in case complexity and that some coding improvements continue to be reflected in the observed case-mix increase.

Of the various factors that are considered in the update recommendation, outcomes are particularly difficult to analyze. For this reason, HCFA has recommended close monitoring of indicators such as the level of preventable deaths, premature discharge, and substandard regimens of care. The Secretary and the Congress have had to make subjective judgment on how these factors affect the final update amount.

Taking all these factors into account, we believe our recommended average update amount for FY 1990 of market basket percentage increase minus 1.5 percent is appropriate and that an average update factor lower than the market basket rate of increase is needed to continue to encourage hospitals to better control their costs.

RIN 2050 AC41

Mining Waste Exclusion

AGENCY: Environmental Protection Agency.

ACTION: Final rule.

SUMMARY: Section 3001(b)(3)(A)(ii) of the Resource Conservation and Recovery Act (RCRA) excludes "solid waste from the extraction, beneficiation, and processing of ores and minerals" from regulation as hazardous waste under subtitle C of RCRA, pending completion of certain studies by EPA. In 1980, EPA interpreted this exclusion (on a temporary basis) to encompass "solid waste from the exploration, mining, milling, smelting, and refining of ores and minerals" (45 FR 76619, November 19, 1980).

Today's final rule responds to a federal Appeals Court directive to narrow this exclusion as it applies to mineral processing wastes. EPA published a proposed rule articulating the criteria by which mineral processing wastes would be evaluated for continued exclusion on October 20, 1988 (53 FR 41288) and a revised proposal on April 17, 1989 (54 FR 15316). In today's final rule, EPA provides final criteria that have been modified in response to public comment, and finalizes the Bevill status of nine mineral processing waste streams that were proposed for either retention within or removal from the exclusion in the April notice. In addition, the Agency has modified the list of mineral processing wastes proposed for conditional retention in April, based upon the revised criteria and information submitted in public comment. All other mineral processing wastes that have not been listed for conditional retention will be permanently removed from the Bevill exclusion as of the effective date of this rule.

The Agency will apply the criteria described in this rule to the conditionally retained wastes and on that basis propose either to remove them from or retain them in the Bevill exclusion by September 15, 1989. Final Agency action on the scope of the Bevill exclusion for mineral processing wastes will occur by January 15, 1990.

DATES: *Effective Date:* March 1, 1990.

Not later than November 30, 1989, all persons who generate, transport, treat, store, or dispose of wastes removed from temporary exclusion by this rule and which are characteristically hazardous under 40 CFR part 261, subpart C, will be required to notify either EPA or an authorized State of these activities pursuant to section 3010 of RCRA.

See sections VI and VII of the preamble below for additional dates and details.

I. Introduction

A. History

Section 3001(b)(3)(A)(ii) of the Resource Conservation and Recovery Act (RCRA) excludes "solid waste from the extraction, beneficiation and processing of ores and minerals" from regulation as hazardous waste under subtitle C of RCRA, pending completion of certain studies by EPA. In 1980, the Agency interpreted this exclusion (on a temporary basis) to encompass all "solid waste from the exploration, mining, milling, smelting, and refining of ores and minerals" (45 FR 76619, November 19, 1980). In July, 1988, a federal Court of Appeals (*Environmental Defense Fund* v. *EPA*, 852 F.2d 1316 (D.C. Cir. 1988), *cert. denied*, 109 S. Ct. 1120 (1989) ("EDF II")) found that this exclusion is based upon the "special waste" concept first proposed by EPA in 1978 (43 FR 58946) and that

> Congress intended the term "processing" in the Bevill Amendment to include only those wastes from processing ores or minerals that meet the "special waste" concept, that is "high volume, low hazard" wastes. 852 F.2d at 1328-29.

In compliance with this Court decision, on October 20, 1988 EPA published a proposal to further define the scope of section 3001(b)(3)(A)(ii) of RCRA. (See 53 FR 41288) In the October 20, 1988 proposal, EPA presented a criterion for defining mineral processing wastes and a two-part criterion for identifying which mineral processing wastes are high volume; however, the Agency proposed to defer judgment on the hazard posed by high volume mineral processing wastes until preparation of a required Report to Congress. The Agency also applied the processing and volume criteria to its available data on mineral processing wastes, and identified 15 wastes which it believed met the criteria, and which the Agency therefore proposed to retain within the exclusion and study for the report to Congress:

1. Slag from primary copper smelting
2. Process wastewater from primary copper smelting/refining
3. Blowdown from acid plants at primary copper smelters
4. Bleed electrolyte from primary copper refining
5. Slag from primary lead smelting
6. Blowdown from acid plants at primary zinc smelters
7. Process wastewater from primary zinc smelting/refining
8. Red and brown muds from bauxite refining
9. Phosphogypsum from phosphoric acid production
10. Slag from elemental phosphorus production
11. Iron blast furnace slag
12. Air pollution control dust/sludge from iron blast furnaces
13. Waste acids from titanium dioxide production
14. Air pollution control dust from lime kilns
15. Slag from roasting/leaching of chromite ore

Based on comments received on the October 20, 1988 NPRM and further analysis, EPA decided that significant changes in the proposal were necessary before a final rule establishing the boundaries of the Bevill exclusion for mineral processing wastes could be promulgated. Accordingly, on April 17, 1989, the Agency published a revised proposed rule that contained a modified high volume criterion, clarifications to the definition of mineral processing, and for the first time, an explicit low hazard criterion. As stated in the April notice, EPA believes that such a criterion is required in order to identify those mineral processing wastes that are clearly not low hazard and, therefore, not "special wastes" even if they are high volume.

In the April NPRM, the Agency also proposed to remove from the Bevill exclusion all but 39 mineral processing wastes, many of which were "nominated" in public comment on the October NPRM. Of these 39, six wastes were believed at that time to satisfy all of the "special waste" criteria described in the proposal:

1. Slag from primary copper smelting
2. Slag from primary lead smelting
3. Red and brown muds from bauxite refining
4. Phosphogypsum from phosphoric acid production
5. Slag from elemental phosphorus production
6. Furnace scrubber blowdown from elemental phosphorus production

The other 33 wastes were proposed to be conditionally retained within the exclusion, because they are mineral processing wastes that the Agency believed satisfied the volume criterion articulated in the proposal but for which the Agency did not have adequate data to evaluate compliance with the proposal's new hazard criterion. Thus, the following 33 wastes were judged, based in many cases upon information submitted in public comment, to have generation rates that might exceed 50,000 metric tons per year per facility, and therefore, be potentially eligible for continued exclusion under Bevill:

1. Barren filtrate from primary beryllium processing
2. Raffinate from primary beryllium processing
3. Bertrandite thickener sludge from primary beryllium processing
4. Process wastewater from primary cerium processing
5. Ammonium nitrate process solution from primary lanthanide processing
6. Roast/leach ore residue from primary chrome ore processing
7. Gasifier ash from coal gasification
8. Cooling tower blowdown from coal gasification
9. Process wastewater from coal gasification
10. Bleed electrolyte from primary copper refining
11. Process wastewater from primary copper smelting/refining
12. Slag tailings from primary copper smelting
13. Calcium sulfate wastewater treatment plant sludge from primary copper smelting/refining
14. Furnace off-gas solids from elemental phosphorus production
15. Process wastewater from elemental phosphorus production
16. Fluorogypsum from hydrofluoric acid production
17. Air pollution control dust/sludge from iron blast furnaces
18. Iron blast furnace slag
19. Process wastewater from primary lead smelting/refining
20. Air pollution control scrubber wastewater from light weight aggregate production
21. Wastewater treatment sludge/solids from light weight aggregate production
22. Process wastewater from primary magnesium processing by the anhydrous process
23. Process wastewater from primary selenium processing
24. Process wastewater from phosphoric acid production
25. Wastes from trona ore processing
26. Basic oxygen furnace slag from carbon steel production
27. Leach liquor from primary titanium processing
28. Sulfate processing waste acids from titanium dioxide production
29. Sulfate processing waste solids from titanium dioxide production
30. Chloride processing waste acids from titanium and titanium dioxide production
31. Chloride processing waste solids from titanium and titanium dioxide production
32. Blowdown from acid plants at primary zinc smelters
33. Process wastewater from primary zinc smelting/refining

All other waste streams from mineral processing were proposed to be removed from the exclusion. Most of the remaining streams would be low volume; three high volume wastes were proposed for removal on the basis of hazard: Acid plant/scrubber blowdown from the primary copper, lead, and tin sectors.

Finally, the April notice responded to a number of ancillary issues raised in public comment on the October 20, 1988 NPRM. The preamble to the notice presented a summary of these comments and preliminary Agency responses to the questions and issues raised therein. Responses to additional comments received on issues addressed in the April NPRM may be found in section II below or in the Supplemental Response to Comments, which may be found in the docket supporting today's rule.

A complete chronology of the special wastes concept, the Bevill Amendment, and EPA's activities to implement the Bevill Amendment is also presented in the "background" section of the preamble to the April NPRM (53 FR 15318–22).

B. Overview of Today's Rule

Today's rule establishes the final criteria that will be used to define Bevill-excluded mineral processing wastes. This final rule completes the first stage of rulemaking regarding the Bevill status of mineral processing wastes. In evaluating the components of this rule, the Agency has considered information presented in public comment on the October 1988 and April 1989 proposals, and accordingly, has modified the criteria, where appropriate.

These criteria consist of a revised and clarified definition of mineral processing, a modified volume criterion that consists of separate volume cut-offs for solid/sludge and liquid waste streams, and a refined low hazard criterion. Each will be discussed briefly in turn. More detailed descriptions are presented in section III of this preamble.

The definition of mineral processing has been modified so as to include fewer types of unit operations. In most instances, operations that are no longer considered "processing" have been redesignated "beneficiation" operations. The primary reason for making this change is to achieve consistency with previously articulated EPA definitions of "beneficiation". Today's definition provides resolution of potential conflicts regarding the regulatory status of mining wastes that have already been studied and subjected to a Regulatory Determination; the definitions provided in the proposed rules might have suggested another study and determination for materials that have already been addressed by the Agency. EPA did not intend such a result and believes that the definition of "beneficiation" in its 1985 Report to Congress is the most consistent with the standard use of the term.

The high volume criterion has been bifurcated in response to public comment on the April notice. EPA has determined empirically that amenability to subtitle C management controls (the basis for the high volume criterion) varies markedly between liquid and non-liquid waste streams. Examination of data obtained from a recent EPA nationwide census of subtitle C treatment, storage, disposal and recycling facilities reveals that many industrial facilities successfully manage substantially more than 50,000 metric tons per year of a single hazardous wastewater stream. Non-liquid waste streams, in contrast, are managed in quantities greater than 50,000 metric tons per year in only a few instances. Accordingly, the Agency has in today's rule established final volumetric cut-offs of 45,000 metric tons per year per facility for non-liquid wastes and 1,000,000 metric tons per year per facility for liquid wastes. The rationale for these new values is presented in section III, below.

The low hazard criterion described in the April NPRM has been modified to account for resolution of a number of issues raised in public comment. While the Agency has retained its basic approach, it has modified the application of the low hazard criterion to specific waste streams in order to account for additional waste constituent data that have been submitted by facility operators or collected from other sources. The final low hazard criterion is applied by evaluating the data collected by EPA and analyzed using Method 1312 (Synthetic Precipitation Leaching Procedure). If samples of a waste stream from two or more facilities fail the test, then the waste is withdrawn from the Bevill exclusion, unless a preponderance of evidence indicates that the test results are anomalous. The conditions under which EPA will assemble and consider this evidence are discussed in section III of this preamble.

As stated in both the October 1988 and April 1989 proposals, individual waste streams must meet all Bevill special mineral processing waste criteria to be eligible for continued regulatory exclusion and study in the Report to Congress. In many cases, individual mineral processing wastes will not meet these criteria and hence, will be permanently removed from the Bevill exclusion as of the effective date of this rule.

In a limited number of cases, EPA does not currently have sufficient information to evaluate whether specific waste streams conform to the low hazard criterion. As discussed below, the status of these materials will be addressed in a subsequent rulemaking. At that time, the Agency will also reevaluate whether these wastes conform to the final volume criterion using data collected during EPA's recent National Survey of Solid Wastes from Mineral Processing Facilities.

C. Future Activities

This rule establishes the final criteria that will be employed to make individual Bevill mineral processing waste exclusion decisions. Preliminary decisions on the status of conditionally excluded high volume wastes will be articulated in a proposed rule to be signed on or before September 15, 1989. These decisions will be based upon information collected by or submitted to the Agency during recent months.

Final action on proposed wastes will be taken by January 15, 1990. At this time, the final boundaries of the Mining Waste Exclusion for mineral processing wastes will be established.

All mineral processing wastes retained within the final Bevill mineral processing waste exclusion will be subjected to detailed study by EPA. The findings of these studies will be contained in a Report to Congress that will be submitted by July 31, 1990.

Six months after submission of this report, the Agency will publish a Regulatory Determination stating that the studied materials will either be regulated under subtitle C of RCRA as hazardous wastes, or that such regulation is unwarranted.

II. Analysis of and Response to Public Comments on 10/20/88 and 4/17/89 Proposed Rules

A. EPA's General Approach

1. EPA's Response to Statutory and Judicial Directives

In promulgating today's final rule, EPA is responding to a Federal Court of Appeals order to narrow the scope of the Bevill exclusion for mineral processing wastes to a group of "special wastes," i.e., those mineral processing wastes with the unique characteristics of high volume and low hazard. To carry out these directives, EPA is today finalizing the criterion for defining mineral processing wastes and the criteria for determining whether these wastes fall under the exclusion for "special wastes." Furthermore, EPA is today applying these criteria to many of the mineral processing wastes and, therefore, is removing most of them from the Bevill exclusion. Today's rule also

constitutes final Agency action on a select group of high volume mineral processing wastes. The Bevill status of additional high volume mineral processing wastes (i.e., those that are "conditionally" exempt) will be proposed in September of this year. Some of these conditionally exempt wastes will remain within the exclusion for the purposes of further study, others will be removed because further information shows that they do not meet all of the "special wastes" criteria. Under statutory directive, the final regulatory determination for wastes that remain temporarily excluded will be made six months after completion of a Report to Congress. This is the same basic approach EPA used in its October, 1988 (53 FR 41288) and April, 1989 (54 FR 15316) proposals for narrowing the scope of the Bevill exclusion.

EPA received numerous comments questioning the approach of the October and April proposals in narrowing the Bevill exclusion. Several commenters continued to dispute the validity of using the "special waste" concept in interpreting the intent of the Bevill Amendment. In addition, some commenters asserted that EPA had proposed to interpret the Bevill Amendment too narrowly, and that in general terms wastes from the extraction, beneficiation, and processing of ores and minerals should be excluded from subtitle C regulation until comprehensive studies of these wastes can be completed. In contrast, some other commenters stated that the proposed interpretation of the Bevill exclusion was too broad, and that the exclusion should be limited to even fewer "special wastes."

EPA has carefully considered these comments as they apply to the final rule. The Agency maintains its position that the special waste concept is central to understanding Congressional intent underlying the Bevill Amendment, and that EPA must limit the scope of the Bevill exclusion to include only those wastes that meet the "special waste" criteria presented in the rule. EPA encountered no compelling arguments in public comments on the two proposals which would cause it to alter this interpretation of the legislative history; this history is described in detail in the April NPRM.

EPA's position on this matter is supported and in fact mandated by the 1988 Federal Court of Appeals decision that required a narrowing of the scope of the Bevill exclusion for mineral processing wastes. The Court determined that the Bevill Amendment was intended to apply only to mineral processing wastes that meet the "special waste" criteria, i.e., high volume, low hazard wastes. The Court ordered EPA to propose and finalize regulations that narrow the Bevill exclusion to encompass only "special wastes;" today's final rule is the latest in a multistep process to meet the requirements of the Court order.

Despite commenter assertions to the contrary, EPA is not required to complete a comprehensive study of all mineral processing waste streams prior to articulating the specific wastes remaining excluded under the Bevill Amendment. The Court of Appeals ruling stipulates that the required study (Report to Congress) is only applicable to mineral processing wastes that fall within the statutory exclusion; the study is intended to result in a final regulatory determination for those wastes (i.e., whether any of the Bevill wastes should be regulated under subtitle C).

EPA notes that there is a lack of detailed statutory, legislative, regulatory, and judicial history and guidance available to assist EPA in defining, ten years after it was originally proposed, the specific contours of the "special waste" concept, particularly as it applies to mineral processing wastes. EPA's 1978 proposal and the 1979 draft background document do not attempt to define the term "processing of ores and minerals" nor attempt to quantify the concepts of "high volume" and "low hazard." The legislative history of the Bevill amendment in 1980 fails to give content to these concepts as well. And while the U.S. Court of Appeals in EDF II, declares that six hazardous smelter wastes are not "special wastes," it specifically leaves to EPA the responsibility of defining which other mineral processing wastes are special wastes.

As a result, EPA has the discretion and responsibility to develop and apply criteria that define the scope of the Bevill exclusion within the broad limits of this ten years of history. EPA today adopts the approach proposed in October and April, that is, to quantify the terms "high volume" and "low hazard" and apply them to wastes from operations that meet a definition of "mineral processing" developed by EPA to reflect past regulatory history and EPA's professional judgment regarding the mineral processing industry.

EPA believes that using specific quantitative criteria for the volume and hazard tests best allows EPA to fairly characterize which wastes from mineral processing should remain within the Bevill exclusion. EPA agrees that it could have adopted a functional approach to defining "special wastes" from mineral processing, or could have set slightly different quantitative cutoffs based on slightly different assumptions regarding both the volume and hazard issues. However, the volume and hazard criteria adopted today are only used as a preliminary screen to define which wastes deserve closer study. And those wastes which do not pass today's criteria are not automatically subjected to subtitle C regulation; they must also exhibit one or more of the hazardous characteristics adopted by EPA in 1980 after extensive consideration and public participation.

EPA does not believe that the specific criteria chosen today are unreasonable, particularly in light of the very limited time given EPA to complete this final rule. Indeed, as EPA shows below, slight changes in the volume and hazard criteria adopted today would not appreciably affect the list of excluded wastes. EPA believes that it has resolved specific issues related to the criteria in a reasonable manner consistent with the general approach for defining "special wastes" outlined above.

2. Status of Future Waste Streams

In both the October 20, 1988 and April 17, 1989 proposals, EPA stated that the current series of rulemakings would conclude the Agency's response to statutory and judicial directives to define the scope of the Bevill exclusion for mineral processing wastes. In other words, EPA proposed to make a one-time determination of Bevill status. Wastes not yet in existence and wastes not meeting the high volume/low hazard criteria during any of the past five years would therefore not be eligible for Bevill exclusion status in the future.

Some commenters addressing this provision reiterated their disagreement with the one-time reinterpretation approach. They maintained that the Bevill Amendment does not place time limits on the exclusion of wastes, thus the one-time reinterpretation violates Congressional intent. They also maintained that a one-time reinterpretation would decrease environmental protection in the long run by creating a disincentive for industry to employ new manufacturing or waste treatment operations that may unfairly fall under costly subtitle C regulation.

Moreover, given the changing nature of the mining industry, some commenters contended that EPA must consider that new processing waste streams will arise, and that lesser volume streams that vary in quantity may satisfy the criterion in the future.

Commenters pointed to roast leach acid plant residue from primary copper processing, oil shale and tar sand processing wastes, and wastes from the processing of nodules collected from the ocean as examples of wastes that may qualify for the Bevill exclusion in the near future under the proposed criteria.

These commenters also asserted that EPA should study and issue regulatory determinations for wastes that may meet the special waste criteria in the future. They also argued that it is more appropriate to define the scope of the Bevill exclusion for mineral processing wastes directly using the criteria and not create a list of wastes that EPA has determined meet the criteria. Applying the criteria to additional waste streams in the future would allow for the effects of changing market conditions and new mineral processing technologies. Some commenters thus recommended that EPA amend the proposed rule to include a provision whereby if a waste qualifies as a high volume/low hazard waste in the future, it would become subject to the provisions of the Bevill Amendment.

The Agency has considered these comments and decided to maintain its proposed approach of a one-time reinterpretation of the Bevill exclusion for mineral processing wastes. As discussed in the April proposal, EPA interprets the legislative history as clearly establishing a temporary exclusion through the Bevill Amendment over a fixed time period. In fact, the statutory language includes explicit time limits on the Bevill exclusion which apply to the submission of the required Report to Congress and subsequent regulatory determination. Moreover, the Court of Appeals decision stipulates an updated timetable for completion of the study and the final regulatory determination.

In today's final rule, wastes not presently being generated or currently meeting the high volume/low hazard standard will not be considered for special waste status in the future. Thus, EPA is making a one-time reinterpretation of the Bevill exclusion for mineral processing wastes by providing a specific list of such wastes that tentatively fall under the "special waste" criteria. EPA further maintains that the one-time reinterpretation is not contrary to the interests of industry or the environment. New wastes generated in the future will be regulated under either the subtitle C or subtitle D regulatory programs, thus industry will know in advance the regulatory standards that will be applied to new mineral processing wastes. EPA does not believe that failure to apply the Bevill Amendment to future waste streams will discourage treatment of these wastes; the application of Subtitle C or D will, in many cases, create exactly the opposite incentive. Thus, this position is consistent with recent EPA policy initiatives that encourage the development of process changes and new waste treatment technologies that minimize hazardous waste/treatment residual generation.

Certain commenters took issue with EPA's assertion that the Report to Congress on Bevill wastes identified in today's rule would be the last under section 8002(p). They argued that EPA is under a continuing statutory duty to study and Report to Congress under sections 8002(f) and 8002(p) of RCRA regarding wastes from the extraction and beneficiation of ores and minerals in sectors not discussed in detail in EPA's 1985 report entitled "Wastes from the Extraction and Beneficiation of Metallic Ores, Phosphate Rock, Asbestos, Overburden from Uranium Mining, and Oil Shale" (Dec. 31, 1985). These commenters cited pages from a draft EPA report (which was never completed or released to the public) on wastes from certain mineral processing operations. In that draft report, the commenters allege, EPA committed to further study of wastes from the extraction and beneficiation of certain nonmetallic ores and minerals.

EPA disagrees that it is necessary for the Agency to commit to further studies of extraction and beneficiation wastes under section 8002(p). EPA believes that the 1985 Report, and the subsequent regulatory determination, discharged its statutory duty with respect to all extraction and beneficiation wastes. As explained in the Executive Summary to the 1985 Report, the Report specifically addressed "wastes from the extraction and beneficiation of metallic ores (with special emphasis on copper, gold, iron, lead, silver and zinc), uranium overburden, and the nonmetals asbestos and phosphate rock." Oil shale wastes were also addressed in an Appendix. EPA explained that it "selected these mining industry segments because they generate large quantities of wastes that are potentially hazardous and because the Agency is solely responsible for regulating the waste from extraction and beneficiation of these ores and minerals." Report to Congress, page ES-2. However, the Report is not limited solely to wastes from these identified sectors. Rather, the Report considers waste generation, waste management, health and environmental risks, and regulatory impacts on the entire nonfuel mining and beneficiation industry. *See, e.g.*, Report, pages ES-3, ES-4 (overview of the nonfuel mining industry), ES-10 (potential dangers posed by the nonfuel mining industry), and ES-14 (potential costs of regulating mining wastes as hazardous).

EPA's 1986 Regulatory Determination also clearly states that it covers all mineral extraction and beneficiation wastes. As EPA said at the time, "this notice constitutes the Agency's regulatory determination for the wastes covered by the Report to Congress, i.e., wastes from the extraction and beneficiation of ores and minerals." 51 FR 24497 (July 3, 1986). The Regulatory Determination went on to explain that, by contrast, Bevill mineral processing wastes (based on EPA's 1985 proposal) "were not studied in the mining waste Report to Congress and therefore, are not covered by this regulatory determination." *Ibid.*

EPA believes that the Report to Congress and Regulatory Determination make clear the Agency's intent that wastes from the extraction and beneficiation of ores and minerals are to be regulated under subtitle D. Accordingly, EPA has no present plans to conduct any further studies under 8002(p) or make any further regulatory determinations. EPA's draft Report to Congress cited by the commenters was an internal pre-decisional document and does not represent the final Agency policy on this issue. (EPA also has no plans to complete or submit that Report in any form; its relevance was rendered moot by the decision in EDF II.)

3. Retroactive Application of Subtitle C Requirements

In the April NPRM, EPA stated explicitly that subtitle C regulation arising from the withdrawal of Bevill status from most mineral processing wastes would not be imposed retroactively. That is, Subtitle C requirements would apply only to newly generated or actively managed mineral processing wastes that are removed from the Bevill exclusion and that exhibit one or more characteristics of hazardous waste, not to existing accumulations of these materials unless they are actively managed after the effective date of the rule or are subject to regulation as waste mixtures, as discussed in further detail below. This is consistent with standard Agency policy regarding the imposition of new regulatory requirements.

Commenters disagreed on the appropriateness of this approach. One commenter supported the approach, while another stated that the lack of regulation of previously disposed

mineral processing wastes would not be protective of human health and the environment. Most comments on the retroactivity provision, however, centered around the definition of "active management." Several commenters requested clarification of this term.

In keeping with the April proposed rule, today's final rule does not impose Subtitle C requirements (such as those for closure and post-closure care) on mineral processing wastes that were disposed prior to the effective date of today's rule, unless they are actively managed after the effective date. This provision ensures that those mineral processing wastes that were originally excluded from subtitle C under the Bevill exclusion, and are now considered hazardous under the reinterpretation of the Bevill exclusion, are not subject to subtitle C requirements if the wastes were disposed prior to the effective date of the final rule. EPA is maintaining its proposed approach largely because of its long-standing policy of not regulating wastes under RCRA that were disposed prior to the effective date of a rule governing those wastes. See, e.g., 45 FR 33066.

For purposes of this rule, EPA views active management as physically disturbing the accumulated wastes within or disposing additional non-Bevill hazardous wastes into existing waste management units after the effective date of this rule. EPA does *not* intend to bring under subtitle C regulation existing waste management units containing wastes now identified as non-Bevill to which only Bevill wastes or other non-hazardous solid wastes are subsequently added (i.e., this practice will not constitute active management of the non-Bevill waste(s)). For example, a waste management unit receiving a high volume slag excluded from Subtitle C regulation under today's rule may continue to receive additional slag (or other non-hazardous or Bevill waste stream) even if it has also received (prior to the effective date of the rule) hazardous waste now identified as non-Bevill, provided that no additional non-Bevill wastes that exhibit characteristics of hazard or are listed as hazardous are managed in these units. Continued use of an existing unit after the effective date of this rule for treatment, storage, or disposal of additional quantities of a newly listed or characteristic hazardous waste will be considered active management and will subject the entire unit and its contents to Subtitle C regulation.

4. Scope of Today's Rule

In the April notice, EPA stated clearly that its interpretations and definitions regarding the regulatory status of mineral processing wastes under the Bevill Amendment applied only to the wastes addressed in this series of rulemakings (i.e., mineral processing wastes).

Nonetheless, commenters contended that the Agency's position as articulated in the 4/17/89 NPRM with respect to the actual or potential status of coal combustion wastes was unclear. They stated that some of the interpretations and definitions proposed for mineral processing wastes would not be appropriate for application to coal combustion wastes (another Bevill special waste category), particularly the high volume and low hazard criteria presented in the April NPRM, and requested that EPA clarify its position on this issue.

EPA emphasizes that the applicability of the definitions and criteria interpretations contained within this rulemaking, as presented below, is confined only to mineral processing wastes. The Agency believes that the special wastes concept remains a flexible one, and that the criteria for defining special wastes in the mineral processing industry may not be directly transferable to the other special waste categories, particularly coal combustion wastes. (EPA noted differences in its discussion of coal combustion waste volumes in the October, 1988 NPRM.) The Agency will consider this issue further in the context of its Regulatory Determination for coal combustion wastes.

B. The Low Hazard Criterion

As discussed in the preamble to the April 17, 1989 NPRM, EPA has proposed a hazard criterion for use in determining the proper scope of the Bevill exclusion as it applies to mineral processing wastes. The purpose of the hazard criterion is to identify candidate Bevill mineral processing wastes that clearly do not present a low hazard to human health and/or the environment. Any wastes failing such a criterion should be immediately removed from the Bevill exclusion; these wastes would then be evaluated (just like any other solid waste) to determine whether they are hazardous—that is, whether they are listed or exhibit any of the hazardous waste characteristics.

The proposed hazard criterion was based on two types of tests: (1) A pH test and (2) a mobility and toxicity test. The pH test requires that a mineral processing waste have a pH between 1 and 13.5 to be considered an exempt special waste, which represents a one order of magnitude increase of the pH levels used to identify corrosive hazardous wastes (i.e., 2 and 12.5). The mobility and toxicity test requires that mineral processing waste constituents be extracted from the waste using a procedure (Method 1312—Synthetic Precipitation Leaching Procedure) that EPA believes is generally less aggressive in leaching out constituents from solid wastes than the EP Toxicity Test (Method 1310), which is used to determine whether non-Bevill solid wastes exhibit the toxicity characteristic. The waste extract is evaluated in the same manner and at the same regulatory levels as in the EP Toxicity test. As EPA explained in the April NPRM, the low hazard criterion is solely a preliminary screening device to determine which mineral processing wastes are special wastes, and will not be used in determining which wastes will subsequently be regulated under Subtitle C, either as a result of today's rule or in the upcoming regulatory determination.

Comments on the low hazard criterion are organized in this preamble into general comments on the appropriateness of the criterion, followed by general comments on the overall approach, and specific comments on potential components of the approach (i.e., pH test, ignitability and reactivity tests, mobility and toxicity test, constituents for testing, additional standards, application of tests, and types of information).

1. Appropriateness of Establishing a Hazard Criterion

Many comments were received on whether EPA should include a hazard criterion for identifying which wastes should not be subject to continued temporary exclusion from RCRA subtitle C requirements under the Bevill Amendment.

a. *Low Hazard Criterion is Appropriate.* Several commenters supported EPA's proposal to use a low hazard criterion. One commenter maintained that a low hazard criterion is appropriate provided that the test used to evaluate whether the low hazard criterion is met is reasonable and appropriate for use with mineral processing wastes. Another commenter stated that Bevill exclusion status should be awarded only to those wastes that meet both the volume and hazard criteria, and yet another commenter stated that EPA should immediately remove from consideration those wastes that are clearly hazardous, without further study.

Many commenters believed EPA's proposed low hazard criterion is objective, currently feasible, and essential to ensure that wastes that are not low hazard are appropriately regulated. Furthermore, one commenter maintained, the Agency's proposal is a positive step toward environmental protection; high volume wastes, because of their quantities, must be carefully evaluated for their potential risk to human health and the environment.

b. *Low Hazard Criterion is Inappropriate.* Many commenters believed that the low hazard criterion should be abandoned because, they generally contended, EPA's proposal to use a pH test and a mobility and toxicity test for mineral processing wastes directly contradicts Congressional intent and the decision in EDF I (*Environmental Defense Fund* v. *EPA*, 852 F.2d 1309 (D.C. Cir. 1988)), that hazard or hazard alone should not determine whether a waste falls within the scope of the Bevill Amendment. These commenters generally believed that the hazard/toxicity issue is better addressed within the special studies, not as a screening procedure, and/or that Congress intended for some characteristic wastes to be exempted from subtitle C regulation. Basically, these commenters argued that failure to pass the low hazard test should not deny a waste access to the detailed and comprehensive study and balancing of economic and environmental factors mandated by the Bevill Amendment.

EPA has re-examined the special waste concept, the regulatory and legislative history, and the Court decision prompting this rulemaking, and concludes that the hazard criterion described in the April NPRM, with some modifications, is appropriate for use in reinterpreting the scope of the Bevill Amendment. The Agency recognizes that a full and detailed assessment of hazard can and will be appropriately considered in a Report to Congress. Nevertheless, a test designed to identify any wastes that are clearly not low hazard wastes is a necessary and appropriate component of the criteria for identifying mineral processing wastes that should remain temporarily excluded from Subtitle C regulation by the Bevill Amendment. The utilization of a criterion to screen out wastes which are not low hazard is clearly required by the order of the Court of Appeals. *See* 852 F.2d 1331.

Some commenters supporting abandonment or substantial revision of the hazard criterion believed that EPA lacks the necessary data for adopting a low hazard criterion. EPA believes, however, that sufficient data are available to develop a workable and appropriate low hazard criterion for screening purposes and to apply that criterion to some mineral processing wastes. For wastes with insufficient information, EPA currently is conducting an extensive data-gathering effort. The new data will be applied to conditionally retained Bevill wastes, and their regulatory status will be addressed in a proposed rule by September 15, 1989.

2. Overall Approach

a. *Low Hazard Rather than High Hazard Wastes Should Be Identified.* Several commenters stated that EPA should identify wastes that are clearly low hazard and keep them within the Bevill exclusion, rather than identifying wastes that are clearly *not* low hazard and removing them from the Bevill exclusion.

EPA disagrees with this approach primarily because it would be impractical given the time and other constraints that the Agency faces in promulgating this rule. The special study waste concept within the context of this rulemaking necessitates identifying, using a screening procedure, wastes that are clearly not low hazard. To identify wastes that are clearly low hazard would involve the type of study of damage case and other risk-related information that is planned for the Report to Congress, because before concluding that specific wastes pose low hazard, the Agency would require site-specific data on physical and chemical characteristics of the waste, the waste management practices employed, the proximity of the facility and its waste management units to sensitive environments (e.g., wetlands, endangered species habitat) and potential receptors, and other factors that affect waste-related risk.

b. *Low Hazard Criterion Should Be Adopted Based on a Multi-factor, Qualitative, and/or Site-specific Test.* Some commenters indicated that a less quantitative approach for identifying wastes to remove from the Bevill exclusion should be utilized using an analysis of present management methods, environmental settings, and available damage cases, as well as of toxic and leachable constituents. For example, some commenters recommended that the Agency specifically consider information regarding past and current mineral processing waste management practices, which, the commenters stated, will clearly show that the wastes pose unacceptable risks to human health and the environment. Other commenters stated that mineral processing facilities generally pose less risk [than other potentially hazardous wastes] because they are sited in dry climates, far from ground water and drinking water, and in unpopulated areas.

The Agency believes that a multi-factor, qualitative, and/or site-specific approach as suggested by these commenters is infeasible. Given the Agency's time constraints, the information described could not be systematically collected and considered to implement such a low hazard criterion uniformly for all of the various mineral commodity sectors and facilities addressed by this rule. Furthermore, development of such a criterion would be very subjective and difficult to apply consistently in such a short time frame. Rather, the scope of the Bevill exclusion will be defined using the hazard criterion (and the volume criterion) in lieu of obtaining site-specific data. Wastes that fail this screening test are clearly not low hazard and, therefore, will be subject to potential Subtitle C regulation. For wastes remaining in the Bevill exclusion, EPA will collect and analyze various kinds of additional data (e.g., damage cases, site-specific environmental and waste management factors) for the Report to Congress. This additional analysis will involve consideration of the factors identified by commenters, and will ultimately support a regulatory determination for the mineral processing wastes temporarily excluded under the Bevill Amendment using the criteria established by today's final rule.

c. *Specified Tests Generally Are Appropriate.* Several commenters felt that EPA's proposal to use a synthetic precipitation leaching procedure for mobility testing is appropriate. One commenter maintained that any hazard test should be less stringent than the subtitle C characteristics tests and should demonstrate whether a waste poses a clear and unambiguous hazard to health or the environment. This testing standard, the commenter further stated, is necessary because the hazard criterion will be used as a screening mechanism to determine which wastes warrant further study; wastes failing the low hazard criterion will be evaluated like any other solid waste to determine whether it should be subject to subtitle C regulation.

d. *Specified Tests Generally Are Inappropriate.* Many commenters believed that the proposed hazard tests are inappropriate, generally recommending one of three alternatives: (1) EPA should not modify the current

standards, (2) EPA should modify the current standards, and (3) EPA should not use a leaching test to assess mobility.

Many commenters arguing against modification of the standards stated that EPA's decision to modify the characteristics test is an extreme measure to ensure that no low hazard waste would be regulated under Subtitle C prior to detailed study, at the risk of allowing many high hazard wastes to escape such regulation altogether. One commenter argued that a less stringent measure of inherent toxicity should not be used when evaluating a high volume waste, because high volume wastes have a greater potential to release significant quantities of hazardous materials. The result of the proposed hazard criterion, according to the commenter, would be stringent regulation of small quantities of waste while at the same time almost unregulated disposal of wastes that have caused documented environmental damage.

Some commenters contended that the Agency should implement less stringent modifications to the hazard tests. For example, one of these commenters stated that the allowable constituent concentrations in the extract should be 300 times the primary drinking water standard, instead of 100 times the standard (as proposed). According to another commenter, the application of 100 times the MCLs for all chemicals uniformly is of questionable validity. Others believed EPA should use the EP Toxicity Test for screening, but increase the values for comparison by a factor of 100 (i.e., 10,000 times the primary drinking water standard). These commenters noted that (1) the EP Toxicity Test is well established and widely used and considerable data exists for mineral processing wastes and (2) a relaxation of two orders of magnitude of the comparison values is similar to the proposed relaxation of the pH standard, and has been adopted by EPA's Land Disposal Restrictions program for "California List" wastes.

Some commenters argued against the use of any type of leaching test because of the apparent failure of this test to consider either the actual waste management practices being used or any other site-specific factors. Another commenter stated that because of the shortcomings of leaching procedures, the classification of wastes as hazardous or non-hazardous should not be based solely on an acid extraction test. Another commenter contended that Method 1312 yields extraction information only, and that testing for the mobility of a particular component can only be done by site-specific evaluation. One commenter argued further that the Method 1312 test only assesses mobilization of contaminants to ground water under accidental conditions; no other environmental media or exposure route is measured. Consequently, the commenter contended, the test does not provide a complete measure of a waste's potential hazard.

EPA has considered these comments and continues to believe that the low hazard criterion as proposed (i.e., the larger pH range and the more appropriate leaching procedure) is both necessary and appropriate for use as a screening tool. The Agency disagrees that this approach will leave highly hazardous wastes unregulated and free to contaminate the environment; in fact, just the opposite will happen—that is, wastes that fail the screening test will no longer be retained within the Bevill exclusion and will be evaluated like all other solid wastes as to their potential hazard. Wastes that pass the screening criterion test and are retained within the exclusion will be extensively studied, and a regulatory determination will be made as to their Subtitle C or D status within two years. Using the same toxicity factor as used in the EP Toxicity Test (i.e., 100 times the MCL) is appropriate because the attenuation and dilution expected for mineral processing wastes after release into the environment is expected to be similar to wastes managed at other industrial facilities; that is, the transport and fate of the toxic constituents should not be any different whether the waste is a mineral processing waste or some other type of solid waste. Moreover, although the standards set by statute under the land disposal restrictions program for "California List" wastes are 10,000 times MCLs, as the commenter noted, EPA has already proposed to amend these standards by using a multiplier of 100.

The Agency believes that a leaching test is the best way to assess waste contaminant mobility given the time and data constraints that EPA faces. Although EPA acknowledges that a leaching test generally only provides an indication of mobility in ground or surface water rather than in other media (e.g., air), this pathway is generally believed to be, for the purposes of this screening, the most indicative of the potential hazard posed by mineral processing wastes, and the most readily and consistently applicable to all mineral processing wastes, given the constraints of the Agency during this rulemaking. Other media will be assessed for the Report to Congress.

3. pH Test

a. *General.* Many commenters indicated that EPA's proposal to include a pH test was appropriate. Other commenters, however, felt that major modifications were needed for the corrosivity characteristic. For example, one commenter stated that the Agency should change its definition of the pH test for corrosivity so that it applies only to liquid wastes. Another commenter maintained that the approach should be revised because it is inconsistent with the Court's decision in EDF I that mining wastes exhibiting the characteristic of corrosivity, as defined in the RCRA Subtitle C regulations, may not pose a threat to human health and the environment. The application of a corrosivity hazard test to phosphate processing wastes, one commenter argued, would produce illogical and inappropriate results; it is only because aqueous phosphate waste streams are recycled that they ever consistently exhibit a characteristic of hazardous waste. This same commenter stated that for certain facilities, the pH may drop below 1.0 due solely to meteorological conditions.

EPA believes that a pH test is an appropriate indicator of hazard from liquid mineral processing wastes, regardless of whether the wastes were reused prior to their disposal. The comparison of the waste's pH to the proposed standard identifies wastes that are so corrosive that it would not be credible to consider them "low hazard" regardless of the industrial process used to generate the waste or the location of the facility.

The Agency does agree that the pH test should not be applied to non-liquid wastes. However, as discussed more fully below in section III, EPA has established a working definition of liquid and non-liquid wastes that considers the physical and chemical nature of mineral processing wastes on both an as-generated and as-managed basis. The distinction between liquid and non-liquid wastes is really significant, however, only when evaluating individual waste streams with respect to the Bevill volume criterion. Otherwise, as when analyzing waste samples in the laboratory, standard EPA definitions and protocols apply.

b. *Modification of the pH Standard.* Many commenters stated that the proposed increase of the pH range by one order of magnitude (to a pH range of 1.0 to 13.5) is correct and should not be changed. Other commenters, however, felt that the range should be increased even further, while some commenters felt that the range should not be increased beyond the characteristic test range (i.e., 2 to 12.5).

One commenter arguing for a further increase of the pH range stated that EPA's proposed lowering of the allowable pH level by only one pH unit (1) does not reflect the intent of the Bevill Amendment, (2) unfairly penalizes operations that have improved their treatment methods, and (3) contradicts EPA's own statement that the hazardous characteristics tests need not be determinative of Bevill status. Rather, EPA should adopt a lower pH standard of 0.5, which, this commenter believed, would have no appreciable effect on human health or the environment because of the limited migratory tendencies of mineral acids.

Two commenters supporting a further increase of the pH range argued that because mineral acids used in ore processing are not appreciably buffered, the relative acidic strength of the resulting wastes is overstated by the pH measurement; adding buffering agents simply to increase the pH above 1.0 is inappropriate because such an addition would interfere with resource recovery operations. One of these commenters illustrated the point by contending that iron chloride wastes, though exhibiting a very low pH value, would otherwise satisfy the low hazard screening criteria.

As discussed above, EPA believes that the comparison of the waste's pH to the proposed pH range satisfies the need to identify which wastes clearly are so corrosive that they do not merit continued regulatory exclusion and further study. The Agency does not find the above arguments advocating a further increase of the pH range convincing; any further increase in the pH range may result in wastes that are clearly not low hazard remaining in the Bevill exclusion, which may in turn compromise the protection of human health and the environment. For instance, the fact that mineral acids are not appreciably buffered does not alter the fact that wastes of such low pH may pose a hazard. In any case, today's rule will not create undue incentives to buffer mineral processing acids above the 1.0 level, since sampling of all high-volume wastes is now complete.

A commenter arguing for no increase of the pH range beyond subtitle C characteristic levels believed that (1) the proposed rule is arbitrary, (2) it will allow too many wastes to remain within the Bevill exclusion, and (3) EPA's primary goal of protecting human health and the environment will be compromised.

The Agency continues to believe that a one order of magnitude increase in the pH range is entirely appropriate as a screening criterion to determine which mineral processing wastes are clearly too corrosive to remain exempt pending detailed study. EPA also disagrees that environmental protection would somehow be compromised by failure to use the subtitle C pH range for purposes of identifying special wastes. EPA stresses that wastes remaining under the Bevill exclusion still will be evaluated further for specific hazard (including corrosivity) during development of the Report to Congress.

4. Ignitability and Reactivity Tests

Many commenters supported the Agency's tentative position to not screen mineral processing wastes for ignitability or reactivity. Some noted that the RCRA hazardous characteristics tests for ignitability and reactivity are not readily adaptable for a screening function and, particularly in the case of reactivity, are far too subjective to be employed in the manner proposed for the low hazard determination. One commenter argued that the RCRA tests for ignitability and reactivity should not be used to judge low hazard because they fail to identify unambiguously high hazard mineral processing wastes. Another commenter noted that ignitability is irrelevant to most mineral processing wastes because most of these wastes tend to be earthen or aqueous.

For three main reasons, EPA agrees that the RCRA tests for ignitability and reactivity are not appropriate and should not be used in the low hazard criterion: (1) The Agency currently has little or no actual data on the potential reactivity or ignitability of most mineral processing wastes, (2) the tests for ignitability and reactivity, because of their nature, cannot be readily modified for use as part of a screening criterion to identify wastes that are clearly not low hazard, and (3) despite the paucity of actual test results, the Agency does not believe, based upon best engineering and professional judgment, that mineral processing wastes are particularly ignitable or reactive.

5. Mobility and Toxicity Test

The majority of comments on the hazard criterion addressed the proposed mobility and toxicity test. For purposes of this notice, these comments are organized into appropriateness of (1) the EP Toxicity and TCLP Tests, (2) the proposed Method 1312, and (3) other types of tests.

a. *EP (Method 1310) or TCLP (Method 1311) Tests.* Many commenters supported EPA's contention that more appropriate tests than Methods 1310 or 1311 may exist for evaluating mobility and toxicity. Both of these tests are based on an assumption that, under a plausible worst-case mismanagement scenario, wastes might be co-disposed with municipal solid wastes, and several commenters argued that this disposal scenario is implausible for mineral processing wastes. The EP Toxicity Test, one commenter stated, does not correctly represent other conditions experienced by the mineral processing industry, such as low precipitation and high waste volume. Some commenters noted that this same argument should apply to mineral processing wastes removed from the Bevill exclusion, which, they stated, would be in contrast to EPA's statement in the April NPRM that mineral processing wastes removed from the Bevill exemption will be subject to Subtitle C if they exhibit EP toxicity, and that the EP test may be used to determine whether Subtitle C requirements qualify as "applicable or relevant and appropriate requirements" at CERCLA sites.

Other commenters disagreed, however, with EPA's proposal not to use the EP Toxicity Test. These commenters noted the test's well-established reputation, and the large amount of data already collected by the Agency. EPA proposed Method 1312, they argued, without demonstrating the inadequacy of the EP or TCLP tests (e.g., EPA has not demonstrated that the EP or TCLP tests significantly and consistently overestimate leaching of metals from mineral processing wastes). These commenters went on to note that the argument that monofill disposal implies that the EP test is inappropriate for mineral processing wastes clearly was rejected by EPA in promulgating the EP test in 1980. Furthermore, the commenters stated, not using the EP test because of the nature of the extraction medium falsely assumes that each processing waste is disposed of in a manner that precludes it from coming into contact with other processing or mining wastes when, in fact, there is strong reason to presume an acidic disposal environment. These commenters contended that (1) many mining and metallic ore processing wastes have significant acid generating potential (which may result in very acidic conditions, even in a monofill), (2) many wastes are stored or disposed in unlined units, (3) many sites are located in conjunction with mining and other similar activities, (4) many exempted wastes are themselves acidic, and (5) EPA's use of a 100-fold dilution/attenuation factor is sufficiently modified to account for variability in leaching conditions. EPA, they believed, should consider that exposure of non-acidic wastes to acidic conditions through commingling with other wastes, leachate, or contaminated runoff is a highly plausible scenario and certainly a reasonable worst-case scenario.

The Agency acknowledges the well-established reputation of the EP Toxicity Test and the large amount of EP extract data for mineral processing wastes, but nevertheless believes that the EP and TCLP tests and data generally are inappropriate for identifying mineral processing wastes which are "clearly not low hazard" under today's screening process and thus should be removed from the Bevill exclusion. The purpose of the EP and TCLP tests are to determine which solid wastes are "hazardous wastes" under sections 1004(5) and 3001(a) of RCRA; by contrast, today's hazard criterion determines only whether a waste should be temporarily excluded from regulation under section 3001(b)(3).

EPA agrees that mineral processing wastes may be disposed in acidic environments; however, the acids to which they will usually be exposed are mineral acids, rather than organic acids such as that used in the EP and TCLP tests. This fact is central to EPA's use of Method 1312 for evaluating the hazard of mineral processing wastes. In contrast to the disposal of municipal refuse, mineral processing wastes are unlikely to be managed in environments that contain or are capable of generating organic acids, such as the acetic acid formed by decaying garbage; mineral processing wastes, with very few exceptions, do not contain appreciable quantities of organic matter. Thus, EPA believes that use of the EP or TCLP would identify certain mineral processing wastes as not low hazard which EPA believes are appropriate for further study under section 8002(p).

Concerning the use of existing EP/TCLP extract data, and as stated in the April NPRM and discussed in Section III of this preamble, EPA will use existing EP extract data to help evaluate whether a waste stream which fails the basic toxicity test (using Method 1312) should nonetheless remain within the Bevill exclusion under certain conditions. EPA believes that use of EP/TCLP extract data in this fashion is appropriate to account for possible anomalies in the Method 1312 results, since EPA concedes that Method 1312 has not been used in a significant number of past cases.

As already stated, waste streams that are removed from the Bevill exclusion because they do not meet one or more of the Bevill criteria are not special wastes, and will be evaluated for possible regulation under subtitle C in the same manner as any other industrial solid waste. EPA believes that use of the EP (or, in the near future, the TCLP) is appropriate for non-Bevill mineral processing wastes removed from the exclusion today because EPA does not have reason to believe that the worst-case mismanagement scenario would be implausible for such low-volume wastes. Thus, these tests are appropriate for determining the hazardous characteristics of particular waste streams that are potentially subject to regulation under RCRA section 3001 without further study.

Commenters arguing for use of the EP Toxicity Test also noted several sources of information that indicate that the use of organic acids may affect the leaching of lead differently than of other metals. In addition, they stated, the reproducibility of these test procedures could be adversely affected with respect to lead. They noted one study that suggested that in cases in which lead was the only constituent that leached above regulatory thresholds, an additional test (e.g., using sulfuric acid) should be used to eliminate the effect of organic complexation while still retaining the acidic conditions. One group of commenters postulated the inappropriateness of Method 1312 (and argued for a more aggressive leaching method) by citing a certain study's evaluation of the waste extraction test (WET) and possible alternatives. This study, they said, demonstrated that tests other than WET—similar to Method 1312 according to one commenter—suffer from very low or no ionic strength and buffering capacity. The study authors, they contended, rejected claims that organic acids employed by WET, EP, or TCLP are overly aggressive.

EPA recognizes the potential differential treatment of the EP test with respect to lead-containing wastes (because of the organic acid used in the test). But, because Method 1312 does not use an organic acid, this difference is not expected to be a problem. In fact, recent results of comparisons between Methods 1310 and 1312, which EPA examined to respond to these comments, indicate that the difference in aggressiveness between the two methods with respect to lead is greater than the difference with respect to other contaminants. (See below for additional discussion on this point.)

One commenter argued that the use of a deionized water extraction test to measure inherent toxicity of smelter slag is inappropriate because deionized water generally exerts minimal extraction from slags and does not reflect conditions to which slag is exposed in the natural environment. Other commenters, however, argued that deionized water extraction is well tested and is mild enough to screen out only the highly hazardous wastes which, they contended, are the only wastes that EPA should be trying to eliminate from the exclusion at this time. A neutral water method, one commenter went on to state, is an appropriate basis for evaluating which wastes removed from the Bevill exclusion meet the criteria for hazardous waste regulation.

As indicated in the April proposal, the data from deionized water extraction tests were used as surrogates since there was very little data on mineral processing wastes available at the time using Method 1312. However, Method 1312 uses simulated acid rain as a leaching fluid to attempt to reflect conditions in the environment. For this reason, EPA believes that it is a more accurate screening tool than would be the deionized water extraction method. While Method 1312 is expected to be slightly more aggressive than the deionized water extraction test, it is still expected to be less aggressive than the EP toxicity test, and hence, more appropriate as a screening tool.

Since the proposal, EPA has collected samples of all potentially high volume mineral processing wastes for analysis using Method 1312. EPA has been able to complete laboratory analyses of samples from seven of the nine high volume wastes for which EPA used deionized water or EP toxicity data to propose hazard determinations in April. Now that the Method 1312 data are available, the Agency need not rely solely on neutral water or other test data. EPA notes here that the new sampling and analytical data obtained using Method 1312 confirm the Agency's earlier findings with respect to which of the nine wastes are and are not low hazard.

b. *Method 1312—Simulated Acidic Precipitation Procedure.* Several commenters supported EPA's proposed use of Method 1312 for testing the hazardous leachability of mineral processing wastes. Some endorsed the move toward Method 1312 because they felt it was more appropriate than the EP Toxicity Test (although they believed that improvements could be made). Many others contended that, for a variety of reasons, Method 1312 was inappropriate for determining low hazard. The reasons noted related to general issues, as well as the method's supposed lack of representativeness of the environmental conditions to which mineral processing wastes generally are exposed, the lack of available data to evaluate its accuracy, the contention that the method is not less aggressive than current methods, the questionable applicability of the method to local and/or mineral processing conditions, and finally a variety of specific technical issues. These comments are addressed in detail below.

i. *General.* Several commenters stated that Method 1312 was not finalized and could not be replicated. According to one commenter, EPA must abandon Method 1312 and instead rely on the RCRA section 8002(p) factors to study all mineral processing wastes.

EPA believes that, although Method 1312 was not finalized via a final rule at the time of the proposed rule, sufficient data were available in the docket to conduct an appropriate evaluation of the method's suitability as a mineral processing waste screening test. Furthermore, in response to these comments, EPA has examined additional data which have become available since the proposal (these data may be found in the docket for this rulemaking). In response to the suggestion that a RCRA section 8002(p) study should be conducted to evaluate hazard, and as discussed previously, EPA believes that a quantitative screening test is the most appropriate method for identifying wastes which are not low hazard, as required by the EDF II. The Report to Congress will be conducted only for the wastes remaining in the Bevill exclusion.

Many commenters stated that EPA should make the toxicity standards for liquid wastes less stringent because, as proposed, the Agency would be measuring low hazard at the same constituent concentration values used to determine whether a liquid waste exhibits a characteristic of hazardous waste; specifically, the method would impose the same criterion for liquid mineral processing wastes as would the EP Toxicity Test (Method 1310). This judgment is counter, they argued, to EPA's intention of developing a test to determine which wastes are clearly not low hazard, and is contrary to the ruling of EDF I, which maintained that the Bevill Amendment was designed to temporarily suspend regulation of special wastes under subtitle C, irrespective of whether they fail hazardous characteristic tests. As an alternative, some commenters recommended, EPA should adopt the approach used by Congress in identifying liquid hazardous wastes subject to land disposal restrictions. Finally, several commenters suggested increasing by one order of magnitude the contaminant concentrations used to determine the hazardousness of the liquid.

EPA believes that an adjustment of the screening tool for determining which wastes containing less than 0.5 percent solids are not low hazard is inappropriate, because the purpose of the 100-fold increase of the MCL is to account for dilution/attenuation of the dissolved contaminants in the environment. As already indicated, the Agency believes that once contaminants are in dissolved form and available for dispersion in the environment, the same standard should be applied to evaluate their toxicity, regardless of whether the solution tested is a waste sample or a test extract.

ii. *Evaluating the Accuracy of Method 1312.* Some commenters stated that the limited tests that have been performed on Method 1312 focus on only two of the eight metallic constituents of concern (lead and cadmium) and, therefore, are not adequate to support application of Method 1312 to a wide variety of processing wastes. Furthermore, a commenter stated, the Agency should question the accuracy of the interlaboratory testing which compared Methods 1310, 1311, and 1312 only for the parameter of lead and gave no information regarding the effectiveness of these methods on the leachability of other elements. One commenter believed that Method 1312 is inadequate as a screening test because (1) the degree to which 1312 is less aggressive than 1310 is unknown and (2) many data that are available for waste streams using 1310 and 1311 will become unusable if Method 1312 becomes the test. This commenter, however, supported EPA's proposal that data from Methods 1310 and 1311 should be used to a limited extent if Method 1312 remains as the mobility and toxicity test.

As discussed above, EPA believes that both the previous and the current test data for Method 1312 adequately prove the usefulness of this method for the purposes stated. In addition, the effectiveness of Method 1312 (e.g., compared to Method 1310) on elements besides lead has been confirmed (supporting data may be found in the docket for this rulemaking). By definition, a screening test is designed to be accurate only to the extent that it separates out only those segments of a population (in this case mineral processing wastes) that clearly do not meet a certain set of criteria (in this case low hazard). EPA reiterates that Method 1312 is only being applied as a screening test to identify wastes that clearly are not low hazard and therefore do not qualify for a Bevill exclusion. Those wastes that do qualify will still be further evaluated to determine what controls are needed.

iii. *Applicability of Method 1312 to Mineral Processing Wastes and Soils.* According to several commenters, Method 1312 is inappropriate to determine the mobility of contaminants in mineral processing wastes and wastewaters because the method originally was designed for testing contaminant migration in soils.

EPA disagrees that Method 1312 is inappropriate for this or any other reason. The original purpose of Method 1312 is irrelevant to its purpose in this rulemaking, just as its purpose here is irrelevant to other rules that do not involve identification of wastes subject to the Bevill exclusion. For the reasons presented throughout this preamble and in the background document to this rulemaking, Method 1312 is believed to be appropriate for use on mineral processing wastes within the context of the Bevill exclusion hazard criterion.

iv. *Appropriateness of Method 1312 as a Modification of the Standard.* As stated previously, several commenters acknowledged Method 1312's appropriateness as a modification of the mobility and toxicity standard. According to some commenters, however, the use of Method 1312 would not represent a less aggressive standard and, therefore, would be contrary to Congressional intent. They contended that, contrary to EPA's claim, Method 1312 is not consistently less stringent than the existing hazardous waste characteristics tests; for example, in one EPA test, Method 1312 leached more lead than the EP Toxicity Test in 12 of 18 analyses conducted on two soil samples. Before Method 1312 is incorporated into a formal rulemaking, they stated, data should be gathered to unequivocally demonstrate that the leachate concentrations will not be greater than those obtained by Method 1310.

The Agency believes that, in general, Method 1312 will be less aggressive than the EP test and the TCLP test. The following excerpt is from the EPA test report referred to by the commenters as an explanation of the results for the two samples described by the commenters:

> Method 1312, which is in essence a distilled water extraction solubilized very little lead except for the two North Carolina samples, 5 and 6, which contained very high levels of lead in the bulk soil. Results by Method 1310 for these same two soils were in general agreement with the 1312 results because no acetic acid was added during the 1310 extraction of these two soils. That is, for both methods the extracting fluids were nearly identical for these two samples.

In other words, these two unusual soil samples from a Superfund site were both highly acidic and very highly contaminated. In this situation, the EP test and Method 1312 provided essentially the same results. It is also of note that the TCLP, which will replace the EP, was significantly more aggressive than either the EP or Method 1312 for these two samples. The results from these two samples and the conditions of the sites where they were collected are in contrast to the conditions typically found at and sampling results derived from mineral processing facilities, as indicated by EPA's recent sampling program and laboratory analyses using Method 1312.

v. *Applicability of Method 1312 to Local and/or Mineral Processing Conditions.* Some commenters stated that Method 1312 is not applicable to mineral processing operations located in certain areas because the pH of the testing medium is not representative of rainfall in those areas and would potentially yield erroneous results; furthermore, because many mineral operations are in arid areas, the Method 1312 procedure of saturating the waste sample in an acid solution for 18 hours is non-representative of these sites. Other commenters believed that Method 1312 will produce misleading results because it (1) unrealistically targets certain elements in Bevill wastes, (2) produces leaching results that bear no relationship to actual management practices, and (3) fails to account for site-specific conditions. One commenter suggested that EPA allow the extraction fluid for mineral processing wastes to depend on the region of the country where the waste is managed (e.g., a pH of 4.4 could be used for east of the Mississippi, and a pH of 5.2 could be used for west of the Mississippi).

Although Method 1312 includes two different extraction fluids for soils to attempt to account for geographic variations in rainfall, this variation is appropriate only for evaluating in-place soils since their geographic location is known. For evaluating wastes for a national regulation, the Agency cannot assume that all of a particular waste will be generated and managed in any particular location or region. Therefore, to be conservative in protecting human health and the environment, the Agency will apply the pH 4.2 extraction fluid to all mineral processing wastes.

vi. *Specific Technical Issues.* A variety of specific technical issues were presented by commenters. One commenter argued that EPA should abandon the use of the Zero Headspace Extractor (ZHE) in Method 1312 because its erratic results with the extraction of volatiles is a troubling source of unexplained variation. Another commenter arguing against the applicability of Method 1312 stated that the proposed batch test approach does not account for the time dependent and flow dependent kinetics of the mobilization of species from wastes and will overestimate the resultant concentrations when compared to a natural system.

In response to the first point, the Agency believes that it is unlikely that most samples will contain volatile organics at levels of concern, nor does the Agency plan on assessing volatile organics in metal processing wastes; thus, there is no reason not to use the ZHE with the test. Concerning the second point, EPA agrees that overestimates may result, but has already accounted for potential overestimation by the use of a multiplier of 100 for the drinking water standards that are used for comparison.

Many commenters addressed specific aspects of the leaching liquid that should be used for Method 1312. For example, will the extraction fluid be brought into equilibrium with the carbon dioxide in the air? If so, they stated, the buffering capacity of the fluid will change over time if the fluid is mixed and then stored. For consistency, therefore, the description of Method 1312 should state that the fluid is to be mixed immediately before use, or brought into equilibrium with atmospheric carbon dioxide.

Another commenter on the extraction fluid used for the Method 1312 test stated that a carbonic acid/sulfuric acid/nitric acid cocktail, which has been specifically prepared to simulate precipitation, should be used. Another commenter added that, if EPA were to use Method 1312, the extraction fluid volume should be increased from 20:1 to 50:1, or the MCLs should be increased for wastes which have pH's below those of the recommended extraction fluids. One commenter contended that there are technical difficulties in using the deionized water required by Method 1312. For example, the commenter stated, deionized water can have variable pH levels which could lead to inconsistent results. Some commenters stated that, rather than Method 1312, EPA should use ASTM D 3987 (a distilled water leach test) as a more appropriate screening test.

The Agency believes that Method 1312, as described in the background document to this rulemaking, is appropriate as a screening test for mineral processing special study wastes. The current extraction fluid formulation has been adequately tested and does not need modification, and the rationale for reducing the stringency of the comparison toxicity levels for wastes with low pH levels is unclear. The statement that deionized water can have variable pH levels is sound, but this should not pose a problem because the pH is subsequently adjusted to reflect acid precipitation. Finally, given that Bevill mineral processing wastes are by definition generated in large volumes, there is no justification for increasing the extraction ratio (e.g., from 20:1 to 50:1) to simulate actual environmental conditions when evaluating candidate wastes using Method 1312.

If EPA chooses to promulgate Method 1312, some commenters stated, it should address whether a particle size reduction step is appropriate or if the step creates additional surface area that artificially elevates leachability. Another commenter contended that EPA should replace the particle size reduction requirement in Method 1312 with the Structural Integrity Procedure because a number of mineral processing wastes exist as inert, monolithic wastes that are unlikely to be physically degraded in a landfill. This commenter stated that congressional floor debate indicated recognition of this fact. One commenter believed that the selected particle size in the proposed Method 1312 is not a good analog of the particle size distribution in spent ore materials from heap leaching, and another commenter stated that the concept of particle size reduction should be eliminated altogether from Method 1312 and wastes should be tested in their natural state.

The Agency believes that, with respect to particle size reduction, there is a wide variety of particle sizes among the candidate Bevill wastes. In order to achieve analytical results that are broadly applicable across sites and over time, the particle size reduction step is necessary in order to ensure that the smaller particles in the waste as generated or after disposal are adequately represented and that the Agency has data with which to make regulatory decisions for an entire sector based upon sampling results from a small number of facilities.

c. *Other Types of Tests.* One commenter objected to the separate test proposed for wastes suspected of containing cyanides. The commenter contended that EPA must choose either the extraction solution proposed for cyanide, or that proposed for metals; to propose a separate extraction solution to assess cyanide and metals singularly is illogical and technically incorrect. Some commenters stated that EPA should utilize a method developed by the California State Water Resources Board that estimates acid-forming potential of mining wastes, because EPA should not classify mineral processing wastes with significant acid-forming potential as low hazard. Acid Mine Drainage (AMD), the commenters contended, is one of the most serious environmental concerns at mining sites and is pertinent to the mineral processing waste issue given the potential for processing waste storage at mining sites and the potential for processing waste disposal sites to become acidified.

One commenter stated that an appropriate test for inherent toxicity should account for complexing as a release mechanism for metals; for instance, the ASARCO smelter located near Tacoma, Washington disposed slag in low lying areas rich in organic matter, which has resulted in high metals loadings being released into local waterways.

EPA disagrees with the suggestion that the separate test for cyanides be eliminated. Separate tests are appropriate, because metallic elements in solid samples must be acid-digested for analysis, while cyanides can be extracted using less aggressive methods. Acid digestion of cyanide-bearing materials is also dangerous, because it can generate deadly HCN gas. In order to both collect accurate analytical data and protect laboratory personnel, EPA will continue to use separate testing methods. The Agency agrees that acid mine drainage is one of the most serious environmental concerns at mining sites. At this point, however, the Agency is only applying a screening test (Method 1312) to identify those wastes which clearly do not qualify for the special waste exclusion. Those wastes that do qualify will be further studied to determine the need for additional controls, and the acid-forming potential of those wastes is one of the factors that will be evaluated. Finally, the Agency believes that it is technically infeasible to consider factors requiring site-specific data, such as organic complexation of metallic contaminants, in a screening test. This and other risk-related variables will instead be considered for the Report to Congress on wastes retained within the Bevill exclusion.

6. Constituents for Testing

a. *Constituents Proposed in Mobility and Toxicity Test.* Some commenters stated that a major problem with the proposed constituents to be used in the mobility and toxicity test is that no distinction is made between the hexavalent and trivalent forms of chromium, which is important given that EPA has described hexavalent chromium as the more toxic form. One commenter noted that EPA has (1) decided to consider only hexavalent chromium concentrations when listing solid wastes as hazardous wastes and (2) excluded from Subtitle C regulation wastes that fail the EP Toxicity Test due primarily to the presence of trivalent chromium. The commenter claimed that the Bevill status of wastes associated with the processing of titanium ore which contains only trivalent chromium would be affected by the proposed approach.

EPA believes that total chromium concentration is a more valid and environmentally protective indicator of hazardous potential than is a measure of hexavalent chromium, principally because chromium-bearing wastes may be exposed to oxidizing conditions in the environment (which would transform trivalent chromium to hexavalent chromium). Therefore, measuring only hexavalent chromium in mineral processing wastes on an as-generated basis might yield an inaccurate indication of (i.e., understate) actual degree of hazard. Thus, EPA will continue to compare total chromium leachate concentrations to the health-based level for hexavalent chromium. This same concern is reflected in EPA's proposed Toxicity Characteristic rule (51 FR 21648), and was the primary basis upon which six low volume mineral processing wastes were listed (53 FR 35412) in response to the same federal Appeals Court ruling that precipitated this rulemaking (EDF II).

Another commenter stated that EPA should modify the low hazard test so that it focuses on a narrower range of constituents than the EP Toxicity Test. For example, they stated, silver poses no threat to human health and should not be considered hazardous; EPA's proposal to delete the MCL for silver under the SDWA is further evidence that silver is not hazardous.

EPA maintains that the basis for developing the low hazard criterion is the existing evaluation of the four factors (EP toxicity, corrosivity, ignitability, and reactivity) used to identify characteristic hazardous wastes. Silver is one of eight metals included in the EP toxicity test, which is designed to assess potential risk by comparing contaminant concentrations with human health-based standards. Because the Agency has not taken final action reflecting a decision to eliminate silver as a contaminant of concern, EPA will continue to utilize measurements of silver concentration as an element of the low hazard criterion.

b. *Other Constituents.* Several commenters stated that EPA should incorporate additional MCLs or other health standards, such as reference doses, particularly for incorporating fluoride, cyanide, manganese, and nickel into the low hazard criterion. Another commenter believed that it would be highly inappropriate to incorporate additional constituents or measurements beyond the existing EP toxicity contaminants in the mobility and toxicity test.

Remaining comments on the question of other contaminants focused on whether EPA should include radionuclides as a constituent for evaluating the hazard potential of phosphogypsum and other processing wastes. Many of those favoring the inclusion of radionuclides stated that data demonstrate that several wastes generated by the elemental phosphorus sector (furnace scrubber blowdown, process wastewater, and slag) and by the phosphoric acid sector (e.g., phosphogypsum and process wastewater) have leached radium-226 and/or gross alpha particle radioactivity at levels exceeding 100 times their respective MCLs. In the latter case, they noted, alpha radioactivity leached at levels exceeding 1000 times its MCL. Another commenter argued that based on existing cancer incidence data, any waste containing 5 pCi/g or more of radium-226 should be considered hazardous. In addition, the commenter noted, EPA has recognized that phosphogypsum has radium-226 concentrations consistently in the range of 25 to 35 pCi/g.

One commenter questioned any inclusion of radionuclides as a constituent for evaluating the hazard potential of phosphogypsum because of the proposed rule regarding the National Emission Standards for Hazardous Air Pollutants (NESHAPS), which addresses the regulation of radionuclides. The analysis described in that proposed rule, the commenter noted, should satisfy any valid concerns regarding residual radioactivity from phosphate industry wastes, and potential groundwater contamination could be addressed by the RCRA section 8002(p) study.

One commenter argued that there is no basis in RCRA for consideration of radioactivity in determining low hazard; radioactivity is not a characteristic of hazardous waste under Subtitle C, and it

must not be used. Phosphogypsum, according to this commenter, may exhibit radioactivity because of naturally occurring radionuclides, but both Congress and EPA have already given the radiological aspects of phosphate processing extensive consideration, making it unnecessary for the Agency to establish a "bright-line" test for radioactivity.

Another commenter stated that screening mineral processing waste streams out of the Bevill exclusion based solely upon radioactive characteristics without developing standards relevant to the harmfulness of these wastes would not be appropriate because the waste would subsequently fall under Subtitle C regulation, which may not be applicable to radioactive waste; a facility that had a waste removed from the Bevill exclusion might be required to incur substantial expense without public health benefit.

EPA believes that radioactivity and other constituents suggested by commenters should not be included as components of the hazard criterion because they are not addressed in the hazardous waste characteristic tests, which are the cornerstone of and reference point for the low hazard criterion. EPA believes that it would be logically inconsistent to remove a waste from the Bevill exclusion during this screening on the basis of a hazard characteristic that would not, by itself, cause the waste to be regulated under subtitle C. These constituents will, however, be considered in the detailed studies that will underlie the Report to Congress on Bevill mineral processing wastes. Accordingly, the potential risk posed by the radioactive or other nature of any of these wastes will be addressed in detail within the next year. EPA plans to utilize data developed for the radionuclide NESHAP as part of this evaluation.

7. Additional Standards

Many commenters stated that, although the Agency's use of MCLs to measure hazard to human health is supportable, a major deficiency in the approach is the use of the MCL for arsenic (a frequent constituent of processing wastes) in evaluating human health risk; arsenic's carcinogenicity mandates a more stringent standard for human health. Specifically, a 10^{-6} risk level for arsenic was suggested. These commenters also contended that EPA should not rely solely upon the MCL, but instead utilize the lowest standard from among the chronic ambient water quality criteria, MCL, cancer risk level, or oral reference dose for given substances, and then apply the 100-fold dilution factor to establish an appropriate low hazard standard. In addition, these commenters stated, the proximity of many processing sites to drinking water supplies, underlying groundwater, and human populations, as well as numerous damage cases demonstrating risks to public health, argues for a measure of hazard that directly addresses human health.

Commenters also stated that many substances present in processing wastes are more toxic to aquatic organisms than to humans. Moreover, MCLs do not exist for some toxic substances whereas ambient water quality criteria have been developed for many additional substances. Furthermore, EPA has stated in the uncompleted 1988 draft Report to Congress on selected mineral processing wastes that all of the potentially hazardous wastes studied had constituent leachate concentrations that exceeded ambient water quality criteria.

In addition, these commenters added, a number of the mineral processing wastes exceeded hazardous waste standards even when extracted with water. All the copper, zinc, and lead processing wastes, they stated, contain arsenic at levels that exceed a 10^{-6} lifetime cancer risk level; even the minimum concentrations of copper process wastewater, copper acid plant blowdown, copper bleed electrolyte, and zinc process wastewater sampled exceeded this cancer risk level.

In contrast, several commenters stated that for a variety of reasons EPA should not use additional standards. One commenter stated that an aquatic organism or radiological standard should not be used because aquatic organisms and radiological concerns are amply addressed by statutes other than RCRA. Another commenter stated that the aquatic organisms standards are inappropriate for the following reasons: RCRA is almost exclusively a human health-based program; the protection of aquatic organisms is not an integral part of RCRA; other statutes protect aquatic organisms; and mineral processing waste streams are often closed-loop and entirely contained within the facility.

Although the Agency strenuously disagrees with the contention that the scope of RCRA is generally restricted to protection of human health rather than more broad additional protection of the environment, it has decided not to augment the standards that were presented in the April notice. Part of the reasoning behind this decision is not that these standards are irrelevant, but that applying them requires site-specific data that are not currently available for most candidate mineral processing wastes. For example, applying Ambient Water Quality Criteria in any realistic way requires site-specific information on the flow of potential receiving waters, which vary over many orders of magnitude between sites. A more important argument, however, for retaining the standards proposed in April is related to the argument presented in the previous section on other constituents: EPA believes that other standards and criteria suggested by commenters should not be included as components of the hazard criterion because they are not addressed in the hazardous waste characteristic tests, which are the basis for the low hazard criterion. During the Report to Congress, however, many of the additional standards and criteria referred to by commenters will be addressed.

8. Application of Tests

Some commenters disagreed with EPA's proposal that wastes fail (i.e., are removed from the Bevill exclusion) when two or more facilities fail the hazard criterion. Many believed that the proposed "two-facility" decision rule is not stringent enough and the proposed plan to sample waste streams and apply Method 1312 ignores existing data, while others argued that the proposed application of the tests would be arbitrary and capricious. One commenter questioning the statistical accuracy of the "two-facility" test suggested that EPA sample a significant majority of the waste streams. Another commenter added that even if one could accept the statistical validity of making a recommendation based upon only two samples, the samples used in the test may have demonstrated entirely different characteristics; for example, one of the samples could have represented Missouri ores and the other Western ores.

The Agency stresses that it must make decisions, using limited data and within certain time constraints, about the degree of hazard posed by mineral processing wastes. Therefore, the screening approach described in the April NPRM and refined in today's preamble was developed to identify wastes that clearly are not low hazard and therefore should not remain within the Bevill exclusion. In response to comments, EPA has refined the hazard criterion to allow for the use of additional relevant data when a waste is generated at five or more facilities (see section III for details). Moreover, EPA has collected additional data on the nine high volume wastes for which the Agency proposed unconditional

BEST COPY AVAILABLE

Bevill exclusion decisions in April. Data on other candidate Bevill mineral processing wastes will not be available until the September proposal.

The "two-facility" rule, the Agency believes, is appropriate when either (1) substantial additional relevant data are not available or (2) less than five facilities generate the waste. In the latter case, the rule translates into the question of whether half or more of the facilities generate a mineral processing waste that fails the comparison of the Method 1312 extracts to the toxicity levels. The Agency believes that the "two-facility" rule is a reasonable balance between too much and too little stringency. As for whether failure for different constituents at different facilities proves the inadequacy of the two-facility test, EPA believes that this type of situation is precisely why the low hazard criterion (and the characteristics tests upon which it is based) contains multiple factors. It matters little why a particular waste is not low hazard at one site or at multiple sites. What is important is that EPA has a method of identifying the mineral processing wastes that are not low hazard, for whatever reason.

EPA, one commenter noted, should require that the pH values for comparison be the average of a statistically valid number of samples that are representative of the waste stream; otherwise non-representative samples could incorrectly label an entire waste stream as hazardous. The Agency believes, however, that using the median rather than the average of the pH values when more than two samples are available for a facility is more appropriate because pH is measured on a logarithmic scale; the average of the anti-logs of multiple values will always be dominated by the lowest value.

Some commenters recommended that EPA determine that a processing waste passes the low hazard criterion if it passes the criterion for any single facility generating that waste. The Agency believes, however, that this approach would be insufficiently protective and exempt wastes which are clearly not low hazard at a significant number of facilities.

9. Types of Information

a. *Constituent Information.* Several commenters argued that a new sampling effort is inappropriate because the Agency already has compiled information on processing wastes in the phosphoric acid, tin, and titanium ore processing sectors; in addition, this information indicates frequent and large exceedances of the EP characteristic trigger levels. These commenters also argued that EPA already has extensive EP and water leaching data (in the draft Report to Congress) on processing operations in the copper, lead, zinc, and bauxite sectors, and, therefore, the Agency need not conduct a wholly new sampling effort.

EPA reiterates that it does not have adequate information to evaluate most candidate Bevill mineral processing wastes against the hazard criterion developed for this rulemaking (i.e., mobility and toxicity test using Method 1312), which EPA believes is the most appropriate test for this purpose. Therefore, a new sampling and waste characterization effort is vital if the Agency is to apply the hazard criterion and complete the rulemaking process. As discussed elsewhere in this preamble, existing EP toxicity or other data may be used if necessary.

One commenter recommended that appropriate testing methods for determining low hazard consider the hazard of the waste deposit as a whole (i.e., including older waste) and not just the new waste entering the deposit for the following reasons: (1) Time is important in stabilizing the waste; (2) the environmental concern is for influences and releases over an extended period of time; and (3) it is much more likely that long-term leaching behavior rather than immediate release will be important.

The low hazard criterion is designed to be a screening test that uses readily obtainable data. Conducting statistically meaningful sampling and analysis of large quantities of existing material (hundreds of millions of tons at some facilities) is well beyond the proper scope of such a screening test. Moreover, because the removal of the Bevill exclusion will not be applied retroactively (as discussed previously), the Agency believes that characterizing wastes as they are generated is far more relevant to addressing the low hazard criterion than are analytical data on accumulated wastes. As indicated above, data on older waste when it was generated may be used in specific situations.

b. *Damage Information.* Commenters stated that damage cases examined by EPA (in the draft Report to Congress) revealed numerous instances of environmental contamination as well as human health risks created by processing waste sites. In addition, they contended, EPA has had a considerable volume of data on environmental contamination from processing sites since at least 1984. One example where this information should have been used, they stated, was EPA's proposed classification of lead slag as low hazard, when out of the five active lead smelters, one lead smelter is on the Superfund National Priorities List and another has contaminated vegetation and stream sediments with heavy metals. Another commenter added that contamination caused by copper smelting slag in the Tacoma, Washington area has been documented in numerous reports: In 1983, a county health department issued a notice advising against consumption of bottom fish from the Hylebos waterway and against regular consumption of fish from other waterways in the area. The advisory, the commenter contended, was prompted by the presence of arsenic and lead in fish caused in part by smelting slag.

As indicated previously, EPA believes that, given the constraints of this rulemaking, site-specific information generally cannot be systematically considered within the hazard criterion and then applied uniformly to all of the various mineral commodity sectors distributed throughout the country. This information, however, may be considered to some extent in specific situations and definitely will be considered in detail during the study for the Report to Congress. The Agency appreciates information submitted in public comment concerning documented mineral processing waste damage cases.

c. *Risk Information.* Several commenters criticized the Agency's failure to include any risk assessment information within the low hazard criterion. By using laboratory tests exclusively, one argued, EPA disregarded current waste management practices and other important risk factors. Most minerals industry contaminants are heavy metals which are elements that cannot be destroyed or reduced to innocuous states as can organic contaminants. Thus, one commenter stated, consideration must be made in evaluating a low hazard criterion that the source itself is likely to provide the hazard. The commenter contended that to consider only the source is simpler and from a purely environmental viewpoint more acceptable, yet this approach is an inferior method of evaluating minerals industry wastes and is not in the public's best interest. Following the 8002(p) mandate to study risk, this commenter suggested, the Agency should adopt a performance-based regulation utilizing current monitoring, evaluation, treatment, and cleanup technology. Such an approach, the commenter argued, would have the advantage of considering the source and pathways at a site-specific level; the Agency has proven that this is a viable approach by utilizing it with mining and beneficiation wastes.

Several commenters argued that EPA should consider the quantity of waste in evaluating its potential hazard. They suggested that the Agency should, through the use of a variable dilution-attenuation factor applied to high-volume wastes, incorporate a measure of waste quantity into its proposed criterion.

These commenters also suggested that EPA consider all environmental data to determine actual risk arising from mineral processing wastes. They provided data on locational characteristics of mineral processing sites in order to lend support to their argument that there is a need to consider environmental risk at least as carefully as risk to human health in evaluating processing wastes.

The Agency reiterates its position on the use of risk or other site-specific information in the application of the low hazard criterion; this type of approach is inappropriate due to time constraints and EPA's belief that the hazard criterion is a screening tool for mineral processing wastes and is not intended as a replacement for the detailed study required by statute. That study will incorporate information such as waste management practices, waste characteristics, and site characteristics.

C. The High Volume Criterion

The April 17, 1989 NPRM specified a high volume criterion to be used to identify high volume mineral processing wastes. This criterion superceded and modified the original high volume criterion contained in the 10/20/88 proposal. In the April notice, the Agency stated that a waste stream would be classified as a high volume waste if it is generated at an average rate of more than 50,000 metric tons per facility per year. To account for fluctuations in mineral commodity markets, the test was to be applied to the highest average generation rate during any one year between 1983 and 1988. The actual cutoff selected by EPA for the high volume criterion was based on large volume waste streams currently being managed under Subtitle C regulations.

1. General Comments

Several commenters objected to any use of a "high volume" criterion to determine Bevill status. In particular, one commenter argued that the criterion discriminates against those sectors which, by nature of their operations, are small or are operating at reduced levels in a depressed market. Another claimed that the use of only a high volume criterion will lead to inconsistent results by removing from exclusion mineral processing wastes that Congress intended to include within Bevill and which would be likely to remain exempt following submission of the Report to Congress, while retaining in the exclusion some high volume wastes that may be subject to stricter regulation after study for the Report to Congress.

Another commenter argued that establishing a stringent high volume criterion as a screen for permanent exclusion from Bevill is inappropriate because it severely limits the regulatory options available to address particular waste streams. They maintained that the criterion should be construed liberally because retaining a waste under Bevill merely makes it eligible for study and a subsequent determination by EPA on whether the waste should be subject to Subtitle C regulation.

Several commenters recommended that EPA not rely solely on a volume criterion to determine Bevill status. They asserted that many factors were to be studied before mineral processing wastes were regulated and, in addition, that Congress intended low volume wastes which posed significant manageability problems to still be eligible for the Bevill exclusion. They argued that the Agency should consider those "high volume" issues unique to each industry that generates such wastes, including those characteristics unusual or unique to the mineral processing industry.

As discussed at length in the April notice, the Agency rejects these arguments as inconsistent with the Court's reading of legislative intent and as contrary to the special waste concept. Only waste streams that are truly "special wastes" are eligible for examination in the Report to Congress. The high volume criterion has always been central to the special waste concept and is a necessary and appropriate first screen in the final determination of a mineral processing waste's Bevill status. Other industry-specific factors relevant to mineral processing waste management will be considered in EPA's Report to Congress addressing those wastes that are high volume and low hazard.

2. Separate Volume Criteria for Liquid and Non-Liquid Waste Streams

In the April 17 NPRM, the Agency solicited comment on the use of separate high volume cut-offs for liquid and solid mineral processing wastes. Specifically, EPA suggested 1.5 million metric tons per year as a volume cut-off for liquid wastes. The consideration of a higher cut-off for liquid wastes was predicated on the fact that industry routinely manages hazardous wastewater volumes in the millions of gallons per day per facility (i.e., well over one million metric tons per year), which is in marked contrast to non-liquid waste materials which are typically generated and managed in much smaller quantities.

Comments on a separate volume criterion for liquid wastes were varied. While some commenters stated that not only is a separate wastewater cutoff wholly appropriate, it should be much larger than 1.5 million metric tons, others contended that a separate criterion should not be employed at all.

Several commenters supporting a separate criterion for liquid wastes stated that EPA should employ a separate volume criterion for liquid wastes higher than the proposed 1.5 million metric tons per year. They asserted that the proposed 50,000 metric tons per year threshold cannot be justified for liquid wastes even at average hazardous waste treatment, storage, and disposal facilities (TSDs); there must be a separate liquid volume criterion, and it should be substantially larger than 1,500,000 metric tons per year. Specifically, EPA should establish the volume criterion by determining the volume representing the 99th percentile of volume handled at regulated hazardous waste TSDs.

These commenters claimed that such an approach is supported by three considerations: (1) It makes data comparisons with those segments of the Subtitle C regulated community most relevant to the current rulemaking, therefore the results will not be arbitrary; (2) it reflects the technical feasibility of complying with subtitle C regulations, and therefore is consistent with EPA's original concept of the special waste exemption; and (3) by limiting the overlap between the regulated and exempt communities to one percent, it allows for unusual outliers while still narrowing the bounds of the exemption as Congress and the Court in EDF II intended.

These commenters went on to state that a volume criterion for liquids substantially greater than the proposed 50,000 metric tons per year is supported by data from the 1985 Biennial Report and other EPA data. They stated that the average non-commercial surface impoundment TSD owner/operator managed at least 922,000 metric tons of hazardous waste in surface impoundments during 1986, while the average non-commercial underground injection well facility managed at least 403,199 metric tons of hazardous waste during 1986. Data on Alabama, Kentucky, Louisiana, South Carolina, and West Virginia indicate that waste was generated in quantities over several hundred thousand metric tons, generally on-site at the average State TSD.

EPA agrees with the commenters that currently available data on waste management at subtitle C facilities support a higher high volume criterion for liquids than for solids. However, the data from the Biennial Report were not adequate for the type of analysis EPA believed appropriate. To address these comments and to develop a specific cut-off value, the Agency used data from EPA's National Survey of Hazardous Waste Treatment, Storage, Disposal, and Recycling Facilities (TSDR), which contains detailed information about volumes and specific types of wastes generated and managed at Subtitle C regulated facilities during calendar year 1986. These data allowed EPA to conduct a waste stream-level analysis of current management practices and hazardous waste volumes managed at facilities regulated under subtitle C of RCRA. Copies of the data used in the analysis are available in the docket.

As discussed more fully below, the Agency examined individual waste-code data for waste streams entering Subtitle C landfills to develop a revised criterion for solid/sludge materials, and for waste streams entering wastewater treatment processes, surface impoundments, and injection wells to develop a cut-off value for liquid waste streams. The final criterion values reflect the largest single waste code managed at the 95th percentile of the Subtitle C facilities employing these hazardous waste management techniques.

On the other side of the issue, several commenters stated that EPA's suggestion to use a separate high volume criterion for aqueous liquid wastes is inappropriate and that the Agency should apply the same high volume criterion to liquid and solid waste streams from mineral processing operations. They based this comment on the assertion that there is no justification for a separate aqueous waste criterion within RCRA, the Bevill Amendment, the Simpson Amendment, the legislative history, or the Agency's descriptions of the special waste concept. The commenters also contended that the disposal of aqueous wastes is already controlled for the most part under other programs such as the National Pollution Discharge Elimination System (NPDES) of the Clean Water Act and, therefore, a separate volume cut-off is not warranted. These commenters also remarked that a higher liquid waste cut-off would cause many facilities to lose exclusionary status and be regulated under Subtitle C for solids as well as for wastewater.

The legislative history clearly identifies amenability to management under subtitle C as a primary criterion for defining special wastes. The Agency believes that, because liquid and solid wastes have very different characteristics and are managed with very different processes, defining a separate high volume cut-off for liquids and solids is appropriate and necessary to fully capture the differences in manageability of different types of waste streams. The fact that some waste streams may lose their excluded status is not a determining factor in establishing either the basis for or the specific values of a high volume criterion.

A commenter claimed that EPA should not include liquid waste streams in the basis of comparison for developing the high volume threshold value for solid wastes. This commenter also asserted that to determine the threshold value, EPA must compare the volumes and treatability of mineral processing wastes with the volumes and treatability of those wastes which are actually regulated pursuant to subtitle C.

EPA agrees. In today's rulemaking, EPA has proposed separate high volume criterion values for solid and liquid wastes that were derived through separate examination of newly available TSDR survey data on solid and liquid wastes currently managed under subtitle C.

A commenter suggested that application of different criteria to solid and liquid waste streams is unwarranted, because wastewater is commingled with both suspended and dissolved solids; these are not differentiated in the handling process.

The Agency disagrees, because the dissolved and suspended solids are not considered separate Bevill solid wastes unless and until they have been precipitated or otherwise separated from the wastewater and are managed as a distinct waste stream. Candidate Bevill wastes that are in liquid form at the time of generation will be compared to the threshold for liquid wastes and those that are in solid form will be compared to the threshold for solid wastes. A solid/sludge residual from a high volume liquid waste will retain Bevill status if it is high volume, i.e., passes the high volume test for solid materials.

Another commenter asserted that EPA's assumption that wastewater is discharged from mining operations to waters under NPDES permits is incorrect in many cases. They maintained that the wastewater, which is commingled with solids, is evaporated. In addition, there is often no surface water in the vicinity of the mineral processing plants.

EPA has never made or articulated any assumptions about the final destination of wastewaters from mining and mineral processing operations and, in fact, asserts that the destination of treated wastewaters is irrelevant to the issue of determining Bevill status. A waste stream's Bevill status pertains only to how the waste is generated prior to disposal, not the manner in which it is finally disposed. The Agency is fully aware that wastewaters from mining and mineral processing operations are commonly evaporated or recycled after treatment.

One commenter asserted that EPA failed to understand that costs to manage wastewater escalate with impoundment size, thus regulation under subtitle C would burden facilities that manage wastewater in surface impoundments. For this reason, they maintained, EPA should use a less rigorous criterion than the 50,000 metric ton cutoff for liquid wastes.

While it may be true that the cost of waste management in surface impoundments increases in a non-linear fashion with the size of the impoundment, data from the TSDR survey indicate that facilities currently manage up to 44 million metric tons of a single hazardous waste stream in RCRA permitted surface impoundments, and that scores of facilities manage more than 50,000 metric tons of hazardous wastewater in surface impoundments annually. There are 55 facilities from the TSDR data set that managed over 1,000,000 metric tons of liquid hazardous waste in 1986. (A list of these facilities is contained in the docket to today's rule.) Many of these facilities use surface impoundments for one or more of their treatment processes. Across all facilities managing high volume hazardous waste, surface impoundments have been employed for virtually all treatment processes. These data demonstrate that management in surface impoundments under subtitle C regulations is feasible for volumes far greater than 50,000 metric tons.

Several comments specifically addressed EPA's suggestion of 1.5 million metric tons as a liquid waste cut-off. One commenter asserted that a 1.5 million metric ton threshold is arbitrary and inordinately high and suggested 250,000 metric tons as an alternative

value. Another commenter contended that EPA based its 1.5 million metric tons per year aqueous waste threshold on volumes of wastewater treated by other industries and that it is not certain that the mineral processing industry would produce the same volumes. Similarly, a commenter claimed that the 1.5 million metric ton threshold was based on unreasonable comparisons to wastewater streams that require little or no management. The proposed 1.5 million metric ton standard cannot be technically supported, they stated, because it was developed with reference to materials management practices that do not reflect the technical feasibility of applying Subtitle C controls to mineral processing wastes. Finally, one commenter contended that the total quantity of liquid waste streams routinely managed by industry is substantially lower than the proposed 1.5 million metric tons, therefore implementing this criterion would improperly exclude numerous aqueous waste streams from Bevill and the required study.

The Agency disagrees with the commenters on the importance of comparing mineral processing wastes only to identical wastes. The facilities in the TSDR data set represent a wide variety of industrial sectors and production processes, and generate a wide variety of waste streams. Waste streams examined in the analysis can in no way be construed to require "little or no management." Collectively, these facilities employ virtually all available waste management technologies, and commonly employ wastewater management techniques such as equalization, neutralization, metals precipitation, and coagulation/flocculation that are used to manage many, if not most, wastewater streams generated in the mineral processing industry. The docket document for today's rule referenced above also lists wastes generated and waste management technologies employed for 55 facilities managing high volume hazardous waste. Because these waste management technologies are generally available, virtually any wastewater management process employed by a facility in the TSDR data set could also be used by mineral processing facilities.

In its analysis of the TSDR data, however, EPA was sensitive to the concerns of these commenters about the similarity between mineral processing wastes and the subtitle C wastes being utilized to develop the high volume criterion. The similarity of waste streams examined, and therefore, the comparability of the two groups of facilities, is demonstrated by the fact that, of facilities in the data set generating volumes of waste larger than the high volume threshold, several are actually mineral processing facilities and many others are owned and operated by companies that also own and manage mineral processing facilities.

3. Degree of Aggregation of Waste Streams

In keeping with the initial approach delineated in the October 20, 1988 NPRM, EPA stated, in the April 17, 1989 notice, its intention to apply the high volume criterion to individual waste streams. The Agency employed only limited aggregation of very similar wastes such as copper slags and certain process wastewaters.

Commenters in general requested more aggregation of waste streams before application of the high volume cutoff. Several commenters objected to EPA's position that high volume aggregate wastes managed at a single facility are not high volume at all, but rather a collection of low volume single waste streams. They stated that this position undermines the intent of Congress and impermissibly reduces the number of mineral processing wastes subject to further study. They also contended that nothing in the language of the Bevill Amendment or EDF II suggests that this is appropriate.

Another commenter asserted that EPA has artificially segregated processing wastes into specific waste streams for purposes of determining which wastes will remain within the Bevill exclusion. This failure to aggregate is particularly onerous, they claimed, in light of the Agency's tentative decision regarding how to apply the mixture rule.

Several commenters claimed that no evidence exists to indicate that aggregating individual process streams increases potential hazard. They noted that the accepted industry practice is to combine all waste streams in aggregate for disposal. By failing to consider waste streams in the aggregate, they asserted, EPA ignores real world management practices.

Another commenter noted that subtitle C data are based on the combined volumes of all hazardous wastes managed at individual subtitle C facilities rather than the volumes of individual waste streams. If EPA uses these data, they contended, then it must aggregate waste streams at mineral processing facilities as well. An additional commenter maintained that EPA has failed to recognize that slag is a universal term descriptive of metallurgical processing wastes from many industry sectors. They claimed that, by specifically recognizing only wastes termed "slag," EPA has failed to afford continuing exclusion to other metallurgical process wastes that serve similar purposes.

These commenters suggested, instead, that EPA aggregate, for purposes of applying the high volume criterion, those waste streams from mineral processing which are similar in nature and subject to similar management practices. They maintained that both the legislative history and technical waste management feasibility considerations support this argument.

As it stated in the April 17 NPRM, the Agency largely disagrees with these commenters on the issue of the appropriate level of aggregation of waste streams. EPA believes, and the Court has agreed, that mineral processing wastes must meet the special waste criteria, namely high volume and low hazard, to be entitled to temporary exclusion from subtitle C requirements under the Bevill amendment. In order to complete the RCRA 8002(p) study requirements, EPA must define current and alternative management practices that could be employed to manage special mineral processing wastes. In practical terms, this requires that the Agency examine individual waste streams in order to determine whether current management practices are adequately protective of human health and the environment and whether individual Bevill wastes are amenable to Subtitle C controls. Moreover, because it is neither appropriate nor practical to apply the low hazard criteria to aggregated wastes, the Agency believes that it must address waste volumes as well as hazard on an individual waste stream basis.

Additionally, addressing mineral processing wastes on an individual waste stream basis is consistent with waste management regulations under the rest of the RCRA program. Under subtitle C, waste streams are listed individually and assigned waste codes. Each RCRA waste code represents an individual waste stream. Wastes in many industries, such as steel and petroleum production, are separated into several waste codes, each characterizing the individual process that generated them (see 40 CFR 261.31–33). These waste codes are treated individually under many of the subtitle C programs, such as the land disposal restrictions. In addition, requirements to determine whether a waste exhibits a hazardous characteristic contemplate an analysis on an "as generated" basis (see 40 CFR 262.11).

With respect to the commenter who asserted that EPA should aggregate mineral processing waste data because the data used to establish the volume criterion were aggregated, the subtitle C data used in support of today's rulemaking is sufficiently detailed to allow EPA to conduct a waste stream-level analysis of subtitle C waste management. Thus, there is no inconsistency in level of aggregation between the data used to develop the revised high volume criterion and the waste streams to which it has been and will be applied.

The Agency also received comments from representatives of individual mineral processing sectors about specific waste streams.

One commenter claimed that EPA's proposal to segregate waste streams into individual segments within a process is artificial and impractical. They maintained that this segregation would result in costly changes without significant environmental benefit. Because NPDES regulations require extensive recycling efforts and large holding ponds, it would be impractical to segregate waste streams. They asserted that the regulatory controls required by the proposed rule and by NPDES regulations would result in substantial conflict.

Another commenter stated that recirculated process water must be aggregated with phosphogypsum in making high volume determinations. Because water management at phosphate fertilizer plants uses an integrated system, they claimed, it is illogical and impractical not to aggregate phosphate process water for purposes of regulation. In addition, the waters recirculated throughout the phosphate rock processing facility are chemically similar at virtually every point.

The Agency finds these arguments unpersuasive. As discussed above and in the April 17 NPRM, it is most appropriate to consider wastes on an individual basis for the purpose of determining Bevill status. The fact that wastes are currently commingled at some point in the production irrelevant to this determination, as are site-specific permit requirements. Sector-specific waste management practices applied to Bevill mineral processing wastes will be evaluated for the Report to Congress.

A third commenter asserted that Congress considered phosphate processing wastes in the aggregate when it identified them as subject to the Bevill Amendment in the 1978 and 1979 documents, thus the Bevill Amendment requires aggregation of phosphate processing wastes. They maintained that management of aggregate waste streams is essential to comply with environmental requirements and has not been undertaken to take advantage of the Bevill Amendment. They further claimed that, in its past studies, EPA also has recognized that phosphate process water must be evaluated on an aggregate basis. They concluded that considering phosphate processing streams on an individual basis will provide no meaningful protection of human health and the environment.

The Agency rejects the argument that one sector should receive special treatment for historical reasons. EPA believes that all commodity sectors and facilities should receive equal treatment in the determination of Bevill status. Moreover, as discussed at length in the October and April proposals, EPA believes that in a general sense, aggregation is inappropriate for considering both the volume of and hazard posed by mineral processing wastes. The Agency discerns nothing unique about phosphate rock processing that would justify differential treatment.

Other commenters asserted that the legislative history of the Bevill Amendment directs EPA to study all wastes from the mineral processing industry, including all metallurgical processing wastes whose fundamental purposes are the same. For this reason, they maintained, primary zinc iron residues should be aggregated and treated similarly to metallurgical residues from other nonferrous metal industry sectors. They appealed to EPA to consider that wastes from the various zinc processing operations may be identified by different names depending on whether the facility uses pyrometallurgical or hydrometallurgical techniques, and if hydrometallurgical, by the specific leaching process employed. They maintained that zinc processing residues which are essentially identical, including zinc lean slag, goethite, jarosite, hematite, and simply "iron residue," should be aggregated.

While the Agency understands the argument made by the commenter that the wastes mentioned are all impurities from the production of zinc, EPA has determined that the wastes arise from fundamentally different production processes (e.g., pyrometallurgical versus hydrometallurgical). It has, therefore, concluded that the wastes are not sufficiently similar to warrant aggregation. In addition, as discussed above, the Agency disagrees that the Bevill Amendment requires EPA to study all mineral processing wastes for the Report to Congress regardless of volume or hazard.

A commenter stated that sludge from beryllium ore leaching should remain within the Bevill exclusion. Prior to adding the sludge leaching step to enhance recovery of beryllium, materials now discarded as part of the low volume sludge leaching stream were discarded with the high volume barren filtrate stream. For this reason, they concluded, separating these waste streams for the purpose of determining high volume is inappropriate.

EPA disagrees with this argument. If the waste streams are separable, they are evaluated individually with respect to volume and hazard. The question of which other stream(s) might be comanaged with a given stream at any point in time is entirely irrelevant to these determinations.

4. Alternative Components/Application of the High Volume Criterion

In the April 17 NPRM, EPA proposed to apply the high volume criterion as the average annual facility generation rate across all facilities generating the waste streams in question.

Several commenters stated that the high volume criterion should allow exemptions for specific facilities generating over 50,000 metric tons of waste per year even if the industry average is less than the 50,000 metric ton threshold. One commenter contended that the Agency should recognize that meeting the 50,000 metric ton threshold would qualify a waste for study, not necessarily grant exclusion from subtitle C regulation. They also believed that using an average generation rate across a sector inaccurately represents the feasibility of real world management practices. The use of sector-wide averaging, they claimed, only serves to reduce EPA's burden and does not address the waste management problems faced by industry.

Another commenter asserted that EPA's rationale for changing the high volume criterion is illogical. They claimed that EPA's view that it is discriminatory to allow a facility which generates large volumes of waste to qualify for an exclusion is counter to the entire basis for the Bevill Amendment. The commenters also argued that EPA should not subject a facility to inappropriate requirements simply because some similar but smaller operations could not meet the Bevill criterion and could comply with subtitle C. They maintained that it would be much more discriminatory to impose the full panoply of subtitle C controls on a facility which cannot economically or technically comply with them. They further maintained that even the

flexibility allowed for large volume generators under RCRA 3004(x) would be lost under EPA's proposal.

The Agency finds this argument unpersuasive and, therefore, maintains that a sector-wide average facility generation rate is the most equitable way to define high volume mineral processing wastes. As stated in the April 17 NPRM, allowing any individual facility to qualify for the exclusion while requiring other, smaller facilities in the same sector to comply with subtitle C regulations would be unfair to the smaller facilities. Alternatively, excluding a waste stream on a sector-wide basis because of the large waste volumes generated by one facility might result in the retention within the exclusion of wastes that clearly are amenable to subtitle C controls at most facilities. As stated in the April NPRM, the Agency believes that the sector-wide average per facility generation rate represents the best alternative between these two extremes.

In the October 20, 1988 NPRM, the Agency solicited comment on the use of a second test for the high volume criterion; this test was based on industry sector-wide waste stream generation. This test was dropped for the April 17 NPRM.

Several commenters contended that EPA should retain the industry-wide criterion because it is a useful alternative for volume determinations. One commenter maintained that the Court of Appeals ordered EPA to draft criteria for Bevill wastes consistent with the Agency's historic definition of "special waste" and that the industry-wide criterion is an integral aspect of the Bevill mandate.

The Agency maintains that average waste generation per facility is a better indicator of the amenability of a waste to management under subtitle C than industry-wide waste generation. As noted in the April 17 NPRM, this belief is based largely on the fact that most large volume mineral processing wastes are managed on-site. EPA notes that the U.S. Bureau of Mines supports EPA's position on this issue. EPA also notes that the decision to eliminate this criterion affected only one waste stream of all those proposed in October or April or otherwise nominated (lime kiln dust). Lime kiln dust is generated by a calcining operation and, as discussed further below, is a beneficiation waste. Therefore, elimination of the criterion has no practical effect.

EPA also received comments on the idea of using a ratio of waste volume generated to quantity of final product as an additional or alternative volume criterion. This was an idea on which EPA had solicited comments in the October 20 NPRM but which it decided not to employ in support of the revised high volume criterion published in the April 17 NPRM. Many commenters advocated using such a ratio instead of the average waste generation rate which EPA has used as the sole high volume criterion since the April 17 NPRM.

The Agency wishes to make clear the fact that it has never considered using a waste to product ratio as either a sole or alternative high volume criterion. At one time, EPA considered using a ratio in combination with the average generation rate as a high volume criterion. Following further analysis, EPA concluded that no added analytic power was provided by the ratio, because it has no relevance to the feasibility of managing a waste stream under subtitle C. For a full explanation of EPA's reasoning, refer to the April 17 NPRM (54 FR 15329). EPA has encountered no compelling arguments in any of the numerous comments on the October or April proposals that would support a change in the Agency's position with respect to the ratio concept.

Other comments addressed units of measurement. One commenter maintained that EPA should adjust its high volume criterion to take into account a waste's density. "High volume," they asserted, refers to the space a waste occupies, not its weight; the space a weight occupies is more relevant than its weight in determining its amenability to Subtitle C management.

EPA disagrees with this assertion and continues to believe that mass is the most relevant and workable indicator of the manageability of a waste stream. Because the physical space consumed by a material can vary over time based on the way in which it is handled (e.g., even "solid" materials can be compacted or undergo particle size reduction), EPA believes that mass is a more stable, and thus, more appropriate basis on which to develop and apply the high volume criterion. Additionally, mass is the most practical measure for evaluating waste quantities; virtually all other data on hazardous waste collected by EPA is measured in metric tons.

5. Type of Waste Used as the Basis of Comparison

In the April 17 NPRM, EPA based the high volume cut-off of 50,000 metric tons on volumes of waste generated and managed at Subtitle C regulated facilities. Congress intended the Bevill exclusion to cover only those waste streams that are generated in such quantities as to be potentially unmanageable under subtitle C regulations. For this reason, the Agency feels strongly that comparison of mineral processing waste volumes with those of wastes managed under Subtitle C controls for the purpose of determining Bevill status is wholly appropriate and, in fact, the only appropriate analytical basis for developing the high volume criterion.

One commenter representing mineral processing industry interests maintained that the high volume criterion should be set at a level that reflects the proven technical feasibility of onsite disposal of similar wastes subject to Subtitle C regulation and that the threshold value should be based solely upon disaggregated waste streams.

The analysis undertaken by EPA in support of today's rulemaking reflects both of these concerns.

Several commenters objected to EPA's refusal to use the lowest of extraction and beneficiation waste generation rates to establish the high volume threshold, especially in light of the Agency's recognition that some extraction and beneficiation wastes are generated in volumes less than 50,000 metric tons per year. Another commenter maintained that refusal to use the lowest generation rate of the candidate Bevill wastes seemed in direct contrast with EPA's statement in the April NPRM that the generation rates of the six recently listed smelting wastes should serve as a lower bound for the high volume criterion because the six wastes are generally accepted as low volume wastes. An additional commenter asserted that EPA's selection of 50,000 metric tons per year as the high volume criterion based on comparison to generation rates of the extraction and beneficiation industry is arbitrary, without any factual basis, and improperly removes most mineral processing wastes from the study required in RCRA § 8002.

These comments represent a distortion of EPA's reasoning in the April 17 NPRM. At that time, the Agency asserted that wastes from extraction and beneficiation were typically generated in volumes orders of magnitude greater than most mineral processing wastes and therefore would be inappropriate to use as a lower bound for the volume cutoff. Subsequently, the Agency did not base the volume cutoff solely on generation rates of extraction and beneficiation wastes but used this information as a "reality check" for the volume threshold selected. The fact that only a small number of extraction and beneficiation wastes are below the cut-off does not invalidate the concept, and in fact suggests that EPA's volume cut-off value is an appropriate measure of special waste status under real-world conditions.

One Commenter asserted that the fact that EPA received data on management of hazardous wastes biennially refutes the Agency's contention that it had to compare mineral processing wastes with aggregated subtitle C wastes because of insufficient information. They claimed that the 1985 survey (National Report of Hazardous Waste Generators and Transportation, Storage, and Disposal Facilities Regulated under RCRA) showed an average generation rate per waste of 12,467 tons per facility and suggested that this figure would be more appropriate as a basis for comparison.

The Agency agrees that a waste-by-waste evaluation is the best method for developing the high volume criterion, and has been able to use even more recent waste code-level data than that suggested by the commenter to develop the final criteria established by today's rule. The Agency disagrees, however, that the average generation rate is the appropriate value to use as the volume cutoff. As noted in the April 17 NPRM, the high volume criterion should exclude from subtitle C regulation only potentially unmanageable waste volumes, not average waste volumes.

EPA received several comments on the use of commercial subtitle C facilities as the basis of comparison. While several commenters stated that this is an inappropriate basis of comparison, other commenters supported the inclusion of commercial facilities in any data base addressing subtitle C waste management to be used as a basis of comparison.

Commenters favoring the use of commercial facilities objected to EPA's rationale that inclusion of data from commercial facilities is inappropriate because the incentives and costs/benefits from waste management differ for commercial facilities. They asserted that EPA's hazardous waste regulations apply to both commercial and non-commercial facilities; thus, the same incentives for compliance with regulations to avoid fines and/or imprisonment exist for all hazardous waste handlers. They also asserted that EPA has not demonstrated a fundamental difference in incentives for managing large volumes between commercial and non-commercial facilities. They maintained that, because commercial facilities must compete for clients, they do not have unlimited funds to comply with regulations. Finally, the commenters asserted that any difference in incentives does not address the fundamental concern of the volume criterion which is the technical and institutional feasibility of complying with subtitle C requirements. Infeasibility, they added, should not be based upon a cost/benefit analysis which has no foundation in the statute or in the special wastes concept.

These commenters also asserted that data indicate that, in States containing a large number of TSDs, most TSDs are not commercial facilities. They added that TSDs that only manage waste on-site, manage the largest quantity of hazardous waste, indicating that the average quantity of hazardous waste managed per TSD is greater for non-commercial facilities than for commercial facilities. They concluded that these data disprove the theory that commercial facilities should be better able to manage substantial quantities of hazardous waste than on-site TSDs.

While EPA finds many of these arguments unpersuasive, particularly those addressing the economic incentives to operate commercial versus non-commercial subtitle C waste management facilities, the Agency does agree that technical feasibility is the fundamental issue addressed by the volume criterion, and has, accordingly, included commercial subtitle C facilities in the data base used to develop the revised high volume criterion described below.

6. Actual Threshold Value

In the April 17 NPRM, the Agency proposed 50,000 metric tons as the high volume cutoff. This value was to be applied to the average generation rate of each candidate waste stream. Comments on the actual value of the high volume cutoff were mixed, with some commenters arguing that the value was too low and others that it was too high.

Commenters arguing that the proposed value was too low presented evidence from several sources demonstrating that some regulated TSDs manage hazardous waste in volumes greater than 50,000 metric tons. They presented data from the 1985 National Biennial Report stating that in two of the ten EPA Regions, the average quantity of hazardous waste managed at each TSD substantially exceeded 50,000 metric tons per year. The commenters' analysis of these data also indicated that the top 50 and 100 generators of hazardous waste handle waste in quantities 78 times greater and 42 times greater, respectively, than the threshold quantity proposed by EPA.

The commenters also noted that of the nine listed hazardous waste streams EPA used for comparison to mineral processing streams in the October proposal, four are generated in quantities larger than 50,000 metric tons per year. Additional data indicated that two-thirds of the nine largest waste streams currently regulated as hazardous are generated or managed in quantities exceeding 50,000 metric tons per year. Additionally, they claimed that EPA's proposed threshold quantity would exempt the average hazardous waste generator in at least three States.

Finally, the commenters maintained that the fact that 10 percent of the regulated community currently manages waste volumes larger than 50,000 metric tons indicates that the cut-off is too low. They further maintained that a 10 percent overlap between the regulated and unregulated communities is a broad overlap and does not reflect the Agency's assertion that the Bevill exclusion need not be broad.

All of these data, they asserted, indicate that the threshold proposed in the April NPRM is not indicative of technical or institutional infeasibility. They claimed that it could hardly be termed technically infeasible to manage 50,000 metric tons per year of hazardous waste if the average TSD manages quantities approaching or exceeding 50,000 metric tons per year in those parts of the country where large volumes of hazardous waste are managed.

While the Agency agrees with the basic premise of the commenters that available data support a higher high volume criterion (at least for liquid wastes), EPA disagrees with the commenters' particular use of data to support their claims. Specifically, the commenters selectively chose data from certain facilities, states, and regions to support their claims, casting doubt on the validity of their conclusions. EPA is not convinced that these selected data accurately portray current, representative hazardous waste management practices, and believes that presenting data from several selected states and regions in support of an argument is not sufficient evidence on which to base national policy. Additionally, the commenters used data that are aggregated across waste streams and, therefore, are not directly comparable to the analysis EPA has conducted. Finally, the Agency does not believe that a 10 percent overlap between Bevill wastes and the subtitle C universe is necessarily unreasonable.

Commenters asserting that the proposed value for the volume criterion was too high based their assertion primarily on three arguments: EPA arbitrarily selected 50,000 metric tons,

there should be at least a ten percent overlap between the Bevill exempt wastes and the subtitle C regulated community, and 50,000 metric tons is beyond the level of technical feasibility for wastes in solid form.

Several commenters stated that the Agency arbitrarily selected 50,000 metric tons per facility per year as a volume threshold and provided no justification for the selection of that value. A commenter also maintained that EPA should not use this very crude threshold value as a screen to perform a technical feasibility analysis for which it does not have sufficient information and support.

The volume criterion proposed in the April 17 NPRM was based on the best data EPA had available at the time and was therefore not arbitrary. However, since that time, better data have become available and have been used by the Agency in support of the volume criterion established by today's final rule, in part, to respond to these criticisms.

A commenter stated that there should be at least a ten percent overlap between the universe of Bevill processing wastes and subtitle C wastes and that the 50,000 metric ton threshold does not provide the necessary 10 percent overlap. EPA stated that the number of facilities that manage more than 50,000 mt/yr is "well under ten percent of the total," but the Agency failed to place into the administrative record data to support this claim. The commenter contended that the Agency, in failing to respond to comments raised on this issue in the October NPRM, has effectively denied the commenter an opportunity to comment fully on the proposed threshold.

The Agency does not accept the claim that data concerning subtitle C waste management and the development of the high volume criteria are not publicly available. The basis for development of the threshold is described in documents that may be found in the docket for the 10/20/88 NPRM. The issue is moot, however, because the Agency is today modifying the volume criterion based upon updated subtitle C waste management data, as described below.

Regarding the appropriateness of a ten percent overlap between the subtitle C wastes and the Bevill wastes, in the April 17 NPRM, EPA allowed a 10 percent overlap between subtitle C wastes and Bevill wastes to account for problems with the data used in the analysis. The Agency never intended to make the 10 percent overlap a rule for determining the high volume cutoff. The data used in the analysis in support of today's rulemaking are much stronger than those used before and thus the Agency believes a five percent overlap is more appropriate and is supported by these more recent data.

One commenter maintained that, while the threshold value might be used for aqueous mineral processing wastes, technical feasibility requires a much lower threshold for solid mineral processing waste.

The Agency disagrees with this position. The TSDR data indicate that at least five facilities managing hazardous waste in solid form routinely manage 45,000 metric tons per year or more of a single waste stream; this represents roughly five percent of the facilities managing hazardous wastes in on-site subtitle C landfills.

Several commenters arguing that the proposed value is too high suggested lower values ranging from 10,000 metric tons per year to 30,000 metric tons per year. One commenter maintained that EPA should establish a facility average of no greater than 30,000 metric tons per year as this would only be slightly lower than three "acknowledged" Bevill wastes—zinc extraction wastes, utility FGD sludge, and utility bottom ash. Several other commenters stated that the rate should be lowered to a 10,000 metric tons per year facility average as this threshold indicates "high volume" compared to facilities producing wastes that are not classified as special wastes.

As EPA stated above and in the April 17 NPRM, the existence of a few Bevill waste streams with generation rates below the high volume cut-off does not invalidate the adopted threshold. The Agency is not obligated to select a high volume cut-off based on the three "acknowledged" Bevill wastes. As pointed out by a commenter on the April notice, volumes of utility wastes (and by extension, other Bevill wastes) may not be directly comparable to wastes from mineral processing. With respect to the suggestion of a 10,000 metric ton cutoff, EPA has not found support for such a low threshold in any relevant data available to the Agency when technical feasibility is considered as the basis for the determination.

Two commenters stated that EPA should develop a low volume, low hazard category. One commenter noted that many small processing operations are effectively managing wastes and may be significantly affected economically if subjected to subtitle C regulations. Another commenter asserted that there is no need to regulate aggregate or individual low volume/low hazard wastes under subtitle C; regulation under subtitle D would be more appropriate.

EPA disagrees. Congress clearly intended to exempt only high volume, low hazard wastes under the Bevill Amendment. Those wastes which are not high volume may feasibly be managed under Subtitle C or Subtitle D as appropriate. Accordingly, EPA will not establish a separate regulatory category for low volume, low hazard mineral processing wastes.

One commenter claimed that EPA's statements regarding the high volume threshold are contradictory. They noted that EPA made the following statement in the November 1979 Draft Background Document: "due to the obvious interdependence of these criteria and the number of factors involved in assessing any particular criterion, *quantification of the items is impossible.*" (Emphasis in comments only.) It follows, the commenter asserted, that the Agency's current approach in which a given waste stream generated at much less than 50,000 mt/yr, and which still poses manageability problems could be withdrawn from the Bevill exclusion based only on a quantified volume criterion, is absurd.

In 1979, EPA had little experience with the RCRA program, a limited understanding of the characteristics of the regulated community, and incomplete data on hazardous wastes and waste management. Since that time, EPA has dramatically improved each of these initial shortcomings and, thus, its ability to quantify and articulate the special waste criteria.

Finally, one commenter suggested that lowering the volume threshold would not pose any threat to the environment because no matter what the outcome of the section 8002(p) studies, the waste must be regulated either under subtitle C, the provisions of section 3004(x), or subtitle D.

While EPA believes that there is some merit to this argument, as discussed more fully below, the legislative history and direction from the Court dictate that only special wastes are eligible for exemption under Bevill and examination in the 8002 studies.

7. Application of the Cutoff Value to Waste Streams

Several commenters objected to the process of formulating national average volume determinations based only upon data submitted for one facility, arguing that it is arbitrary and capricious. These commenters also stated that EPA should verify all self-reported data submitted by the mineral processing companies because of the incentive for firms to inflate their waste generation rates and thus remain exempt. They asserted that EPA routinely discovers inaccurate self-reported data in other instances, even when those data were submitted under oath.

EPA did not have the time or resources to measure candidate waste streams at affected facilities. In addition, EPA had a very limited amount of time in which to collect the additional data needed to fully determine the Bevill status of each candidate waste stream. In order to propose the regulatory status of several waste streams and provide appropriate opportunity for notice and public comment in accordance with EPA's Court-imposed schedule, the Agency had to rely on self-reported volume data. The self-reported data will be verified by examination of new data from the National Survey of Solid Wastes from Mineral Processing Facilities. Waste streams that the survey data indicate do not meet the high volume criterion will be proposed for removal in the September 15, 1989 proposed rule addressing the status of wastes that have been conditionally retained within the exclusion. Facility operators completing the mineral processing survey are subject to section 3007 penalties for submission of false data.

Several commenters objected to EPA's proposed use of the highest average generation rate over a five year period (1983–1988) as the value for comparison with the volume criterion. Several commenters expressed concern that this would ignore the possibility that waste generation across the years has been reduced due to improved waste management processes. They felt that EPA should not ignore substantial waste reduction trends, when the existence of those trends could remove the eligibility of the waste from the Bevill exclusion. These commenters suggested, instead, that EPA base volume determinations upon the lower of either the average generation quantity from 1982–87 or the average generation quantity for calendar year 1987. This method, they asserted, would allow EPA to take into account both waste reduction trends and variations in market conditions.

Congress intended to exclude only those wastes that are generated in volumes that are potentially unmanageable under Subtitle C. The Agency believes that the highest average generation rate for any year between 1983 and 1988 is a better indicator of potential difficulty in managing a waste under Subtitle C than the method proposed by the commenter because it allows for changes in waste generation rates caused by fluctuations in commodity markets. The method suggested by the commenter is arbitrary and would punish sectors that might have had low waste generation rates in any single year during the most recent five year time period due to poor economic conditions rather than waste minimization efforts as implied by the commenter.

Between the October 20, 1988 NPRM and the April 17, 1989 NPRM, EPA shifted the five year period for which EPA will consider waste generation rates from 1982–1987 to 1983–1988 so that it could base its decision on the most recently available data. Several commenters expressed concern that the shift in the "window" will allow new waste streams to become eligible for inclusion into the Bevill exclusion. They maintained that the Agency should not allow further opportunities for waste generators to provide new data.

The Agency maintains that, in the interest of treating all affected firms equally, any mineral processing wastes that meet the definition of a special waste should be included in the Report to Congress, even if the key information about that waste stream came from 1988.

The Agency rejects the argument of one commenter that EPA should use production data from all facilities producing chrome processing wastes in any year during the period 1983 through 1988, irrespective of whether any such facility is still operating. Because the Agency does not impose requirements retroactively, it would be inappropriate to use past data from facilities that are no longer in operation to develop regulations. Therefore, exclusion from Subtitle C regulation under the Bevill Amendment will be based only on waste volumes generated at active facilities. For additional detail on the EPA's policy not to impose regulatory requirements retroactively, see section II of this preamble.

D. The Definition of Mineral Processing

In the preamble to the October 20, 1988 proposed rule and again in revised form in the April 17, 1989 NPRM, EPA provided criteria for defining and identifying wastes from ore and mineral processing operations. These criteria require that all wastes qualifying for exclusion under the Bevill Amendment originate from a mineral processing operation as defined by the following elements:

(1) Excluded Bevill wastes must be solid wastes as defined by EPA.

(2) Excluded solid wastes must be uniquely associated with mineral industry operations.

(3) Excluded solid wastes must originate from mineral processing operations that possess all of the following attributes:

a. Follow beneficiation of an ore or mineral (if applicable);

b. Serve to remove the desired product from an ore or mineral, or from a beneficiated ore or mineral, or enhance the characteristics of ores or minerals, or beneficiated ores or minerals;

c. Use mineral-value feedstocks that are comprised of less than 50 percent scrap materials;

d. Produce either a final mineral product or an intermediate to the final product; *and*

e. Do not combine the product with another material that is not an ore or mineral, or beneficiated ore or mineral (e.g., alloying), do not involve fabrication or other manufacturing activities, and do not involve further processing of a marketable product of mineral processing.

(4) Residuals from treatment of excluded mineral processing wastes must be historically or presently generated and must meet the high volume and low hazard criteria in order to retain excluded status.

1. Excluded Bevill Wastes Must be Solid Wastes as Defined by EPA

EPA proposed in the October NPRM and confirmed in the April NPRM that it will use the definition of solid waste codified at 40 CFR 261.2 to identify materials that are eligible for consideration as special wastes, stating that nothing in the regulatory history of the Bevill Amendment indicates that the Agency is expected to or should apply a definition of solid waste that is different than that applied throughout the RCRA program.

EPA received a number of comments relating to the issue of when and if the materials under consideration in this rulemaking can be RCRA "solid wastes" when they are destined for recycling. These comments were of three types. Most dealt broadly with the overall question of the Agency's authority to classify materials destined for recycling as solid wastes. A few comments were more specific, mentioning types of materials involved. Finally, another group of comments dealt in detail with types of materials (principally iron and steel slag) that are recycled.

Before responding to these comments, the Agency first notes that this issue is without direct effect on persons managing materials that EPA has determined remain Bevill wastes because they satisfy the high volume/low hazard criteria. EPA will consider such materials further as part of the section 8002 study, but there are no regulatory consequences on persons

managing such materials. (EPA notes further that it is directed to study the "utiliz[ation]" of mining wastes, indicating some expectation that examination of recycling practices would be part of the Bevill study. RCRA section 8002(p).)

There may be regulatory consequences for materials that the Agency determines were improperly classified under previous interpretations of the Bevill amendment. Such materials are analogous to other wastes newly brought into the subtitle C framework, and thus become subject to all of the subtitle C regulations. If such materials are "solid wastes", then they also can be hazardous wastes subject to applicable subtitle C standards. Comments on this point failed to identify specific types of materials affected, however, and so failed to provide any indication of whether there are any elements of discard associated with the recycling activities (such as land based storage, prolonged retention times, management in unrelated facilities, presence of high concentrations of unrecyclable toxic constituents not found in virgin materials that would be processed in place of the secondary materials, and other similar elements). It is EPA's belief, based on prior rulemakings dealing with recycling, that most of the materials newly classified as non-Bevill materials would not be solid wastes when recycled in metal recovery operations because they would be unlisted sludges and byproducts being reclaimed. Such materials are not classified as solid wastes (§ 261.2 (c)(3)), unless they are being speculatively accumulated. Thus, today's rule would not have any practical impact on such materials.

EPA's responses to the commenters' specific points are set out below.

a. With respect to the Agency's authority to regulate types of recycling as hazardous waste management, EPA has indicated many times its views on the extent of its authority. See particularly 50 FR 638 (Jan. 4, 1985) and 53 FR 519 (Jan. 8, 1988). EPA does not subscribe to the view that only things that are thrown away are solid wastes. Such a reading nullifies explicit statutory authorities (see RCRA sections 3004(l), 3004(q), and 3014), and fails to take into account that many recycling practices are characterized by elements of discarding which afford jurisdiction under RCRA Subtitle C. The Agency also does not believe that anything in *American Mining Congress* v. *EPA*, 824 F. 2d 1177 (D.C. Cir. 1987) is to the contrary. Certainly, nothing in the opinion indicates that the Court intended to make legal such practices as the road oiling at Times Beach, Missouri, or unrestricted burning of hazardous secondary materials in boilers and industrial furnaces. Yet this is the direct consequence of the commenters' position. However, as noted above, this issue appears to be only an academic one in this rulemaking, given the lack of practical consequences.

EPA also notes that, contrary to the view of several of the commenters, it is not finalizing the January 8, 1988 definition of solid waste in this proceeding. EPA is indicating that a material need not be thrown away to be a solid waste, and that recycling activities can be characterized by elements of discarding. This has been EPA's articulated position since the first major RCRA subtitle rules were issued on May 19, 1980. 45 FR 33090–94. Had commenters provided more detailed information, EPA could provide more guidance as to the status of particular materials. Given the absence of such comment (with a few exceptions discussed below), EPA can only articulate broader principles here.

b. Some commenters were slightly more specific about the types of materials being recycled that should not be considered to be RCRA solid wastes. One stated that "intermediates and inprocess materials" such as copper matte, blister copper, lead bullion, lead drosses, and various "secondary materials" such as flue dust and wastewater treatment sludges, should not be considered to be solid wastes when they are processed to recover metal values. The specific type of recycling referred to in this comment is reclamation. Existing regulations (see 40 CFR 261.2(c)(3)) state that sludges and by-products such as those discussed in the comment, are solid wastes only if they meet one of the hazardous waste listing descriptions found at 40 CFR 261.1 or 261.32. When wastes from specific or non-specific sources are listed as hazardous, i.e., are included in 40 CFR 261.31 or 261.32, existing waste management practices, including recycling, are considered in establishing the precise wording of the listing. Today's rulemaking would not, however, add new listings to either 40 CFR 261.31 or 261.32, and would therefore not affect whether materials discussed in the comment, assuming that they are being legitimately recycled, would meet the definition of a solid waste. EPA has previously indicated that surface impoundments used for wastewater treatment are not part of recycling operations. *See*, e.g., 53 FR 35414–5 (lead impoundment solids). Such units are generally intended for purposes of waste treatment and are thus normally subject to regulation as waste management units.

c. A number of commenters stated that iron blast furnace slag and basic oxygen furnace slag should not be considered to be solid wastes when they are utilized as aggregate substitutes. EPA notes first that it views these materials as remaining within the scope of the Bevill exemption, so there is no immediate regulatory consequence of calling these materials solid wastes. However, EPA is not making a final determination on the issue of whether these materials are solid wastes. EPA will study this issue further as part of the section 8002 study. Commenters indicated that even though these slags are recycled in ways that involve application to the land (whether directly or in the form of slag-derived products like cement and concrete), the slags have been used for decades interchangeably with high-grade natural aggregates, they meet all relevant commercial specifications for aggregate, there is a known and profitable market for all of the slag generated by industry (indeed, some blast furnace slag is imported to meet domestic demand), and the slag appears impervious to leaching toxic metals under the EP toxicity test. EPA has requested further information comparing these blast furnace slags to virgin aggregates to ascertain whether unrecyclable toxics might possibly be being disposed by the recycling practice. The Agency is impressed by the public comments, however, and may ultimately determine that these slags are not solid wastes. Certainly, based on the public comments, these slags appear now to be a long-standing part of the commercial aggregate market, and are commonly accepted as meeting all relevant commercial specifications.

A second commenter indicated that recirculating process water is not a waste. Although the commenter did not describe precise details of operation, the Agency agrees that normally continued use of process water in an industrial process does not involve wastewater but rather continued use of process water. This answer assumes, however, that wastewater is not removed from the system to be reclaimed before it can be reutilized. In the event that this process water is managed outside of a closed-loop recycling system, such as in a surface impoundment for cooling or settling, then the impoundment would likely be considered a waste management unit and subject to EPA's jurisdiction, as discussed above.

2. Excluded Solid Wastes Must Be Uniquely Associated With Mineral Industry Operations

To be excluded under the Bevill Amendment, solid wastes must be uniquely associated with the mineral processing industry. EPA received no significant comments either in support of or in opposition to this criterion, and will continue to require that wastes meet this criterion.

3. Excluded Solid Wastes Must Originate From Mineral Processing Operations as Defined by Five Specific Criteria

In general, commenters believed that the attributes used in the proposed rule to define mineral processing were acceptable. As discussed in the Appeals Court decision that precipitated the current rulemaking, EPA is obliged to consider whether candidate wastes are high volume and low hazard in making Bevill mineral processing waste exclusion decisions. While these factors are, and have always been, the key elements in identifying special wastes, the distinction between mineral processing and nonmineral processing wastes is important because Congress intended to put within the regulatory exclusion only wastes generated as a consequence of exploiting a natural resource, not wastes from other industrial activities, even if both occur at the same facility.

a. *Operation must follow beneficiation of an ore or mineral (if applicable). Processes that use heat to change the chemical composition of ores and minerals, or beneficiated ores or minerals, are considered mineral processing operations. Heap, dump, and in-situ leaching, as well as tank and vat leaching, are specifically defined as beneficiation operations.* Commenters addressing the October, 1988 NPRM's beneficiation definition argued that it did not adequately delineate the boundary between beneficiation and processing. The U.S. Bureau of Mines (BOM) commented extensively, claiming that the October definition did not adequately express EPA's intent that leaching be considered a beneficiation operation. Therefore, in the April, 1989 NPRM, EPA modified the proposed rule (1) to define heap, dump, *in-situ*, tank, and vat leaching as beneficiation, unless they follow one or more processing operations in the production sequence, in which case they are considered processing operations; and (2) to clarify that processing operations use chemical reactions, electrolytic techniques, or pyrometallurgical/thermal processes (e.g., roasting, smelting, calcining) to concentrate or enhance the characteristics of valuable constituents and, thus, differ from beneficiation operations (some beneficiation operations employ heat, but only to remove water).

Industry commenters addressing the April NPRM criticized EPA for, in effect, narrowing the definition of beneficiation, claiming that the Agency focused too strongly on chemical and physical distinctions when it clarified the beneficiation definition. By classifying steps such as roasting as mineral processing and steps involving drying as beneficiation, the Agency's definition, they claimed, would result in some previously excluded beneficiation wastes now being considered "processing" wastes potentially subject to Subtitle C regulation. They complained that EPA has offered no explanation for why it has apparently decided to eschew previous definitions of beneficiation. They contended that the shift could cause precious metals industries in the United States to suffer drastic and unwarranted economic impacts. Commenters insisted that the Agency address the problems caused by its "clarification" of beneficiation and processing and suggested the alternatives below.

i. *Use the Report to Congress Definition of Beneficiation.* Many commenters recommended that the Agency abandon the restrictive list of beneficiation operations in the NPRM and adopt the definition of beneficiation found in the 1985 Report to Congress. These commenters maintained that this definition historically has been accepted by the mining industry, adopted by EPA, subjected to Congressional scrutiny, has withstood litigation in EDF I, and can be traced back to an even earlier definition found in the EPA effluent limitations guidelines development document on ore mining and dressing. The commenters claimed that any attempt by EPA to contradict the Report to Congress and its Regulatory Determination is barred both as a matter of administrative law and by Congress' decision that beneficiation wastes may not be regulated as hazardous without an additional Report to Congress and Regulatory Determination.

ii. *Eliminate or Modify the Heat Criterion.* Many commenters suggested that EPA eliminate or modify the heat criterion added as a part of the clarification in the April, 1989 NPRM. Commenters stated that the Agency's addition of the "heating" of ore criterion redraws the line between beneficiation and processing without adequate analysis of the impact of such revision, or support in the Bevill Amendment or the legislative or regulatory history. They argued that using heat as a criterion improperly includes beneficiation operations within mineral processing. They claimed that production activities used in the beneficiation and extraction of gold demonstrate that certain pretreatment steps are necessary to prepare ore for leaching, and insisted that EPA not categorize any pretreatment steps as processing regardless of whether they involve heat treatment. Many commenters, in discussing using heat as a criterion, addressed calcining, roasting, and leaching operations that use thermal pretreatment (i.e., autoclaving, roasting, and chlorination). These comments are summarized below.

Roasting of ore, commenters contended, is incorrectly considered a mineral processing operation rather than beneficiation in the NPRM. They contended that roasting does not fit any of the other four processing attributes detailed in the rule; roasting does not remove desired product from an ore or mineral, does not use feedstock comprised of less than fifty percent scrap, and does not produce either a final product or an intermediate to the final product, and does not involve manufacturing, alloying, etc. They noted that under the proposed definition, any operation that follows roasting or autoclaving is considered mineral processing; leaching, however, is specifically defined as a beneficiation operation, and EPA should not separate out leaching operations that involve thermal treatment.

Regarding leaching operations, commenters, especially those in or representing the precious metals sectors (e.g., gold, silver), and the Bureau of Mines agreed with EPA that beneficiation should include physical/chemical separation techniques such as heap, dump, tank, vat, and *in-situ* leaching.[1] The commenters, however, argued that the use of heat as a pretreatment for the leaching operation should not automatically render an operation as processing, noting that ores and minerals which are roasted, autoclaved, or chlorinated are no less earthen than is raw ore, and their volume remains relatively unchanged. They noted that if finalized, the April, 1989 NPRM could subject tailings or spent ore from many leaching operations to subtitle C regulation, even though the Regulatory Determination of July 3, 1986 stated that these wastes did not require such regulation. Commenters claimed that, because the near surface precious metals deposits are being depleted, the future of the industry lies in the deeper sulfide zones that produce ores requiring some pretreatment (i.e., roasting, autoclaving, and chlorinating) to effectively yield their metal values. The Agency must consider, they argued, the extremely onerous operational consequences (e.g., requiring parallel waste units for identical waste streams) and economic consequences (e.g., putting small or marginal mines out of business) that would result from maintaining the processing definition in the most recent proposal; this definition would, concurrently, yield no significant environmental benefits. Therefore, the commenters requested that EPA clarify that wastes from leaching operations that pretreat will remain beneficiation wastes excluded from Subtitle C. Alternatively, they noted, if EPA retains the definition given in the April notice, the Agency will be required to restudy gold leaching wastes (gold roaster/leach wastes would not differ significantly from the leached ores studied previously by EPA in the 1985 Report to Congress) since they would meet the high volume criterion.

Calcining, the heating of ores to high temperature without fusion of the mineral values (generally to drive off volatile components such as water and carbon dioxide), also received extensive comment from commenters who were concerned that EPA considered calcining to be processing. These commenters suggested that EPA should limit its clarification of beneficiation to exclude only those heating operations where the calcining gases effect a chemical change that will facilitate smelting. Representatives of the western phosphate processors, in particular, attacked the inclusion of calcining in processing, claiming that the sizing, drying, agglomeration, and concentration functions of calcining—which do not chemically alter the phosphate nor remove valuable constituents—meet EPA's definition of beneficiation and that the classification of phosphate rock calcining or drying and nodulizing/heating operations as beneficiation has long been the subject of agreement between EPA and the phosphate processors. The phosphorus industry stated that calcining is analogous to the calcining employed by diatomaceous earth producers which is regulated under subtitle D and argued that a supportable distinction can be made between metallurgical calcining and those heating operations found in the diatomaceous earth and phosphorus industries.

iii. *Make Other Modifications to the Beneficiation Definition.* As an alternative to using the RTC definition, industry commenters recommended several modifications to the definition of beneficiation.

- EPA should view beneficiation collectively and functionally, define beneficiation as activities, both physical or chemical, by which ores and minerals are prepared for further refinement. An operation which precedes beneficiation and/or conditions or prepares an ore or mineral so as to make it more amenable to beneficiation, should also be considered to be part of the beneficiation operation, regardless of whether the operation employs physical or chemical techniques. Removing impurities and improving quality is a purpose of beneficiation and coincides with the generally accepted technical usage of beneficiation.
- EPA should clarify that wastes from beneficiation operations that follow a processing step should be considered beneficiation wastes. Therefore, the Agency should state that any steps performed after beneficiation ends are processing operations and that processing would begin with the last beneficiation activity, not with the first processing activity. This clarification would draw a clear boundary between beneficiation and processing that would reflect "real world" operations better than the definition provided in the April 17, 1989 NPRM.
- If the Agency seeks to control specific beneficiation waste streams, it should use the Subtitle C "listing" mechanism as opposed to redefining beneficiation.

iv. *Specify Certain Activities as Beneficiation.* In addition to roasting, autoclaving, calcining, and leaching, many commenters addressed specific operations, recommending that EPA clarify that certain activities are beneficiation operations. Collectively, these commenters suggested that EPA adopt a definition of beneficiation that includes physical/chemical separation processes such as crushing, grinding, gravity concentration, magnetic and electrostatic separation, flotation, precipitation, amalgamation, ion exchange, solvent extraction, electrowinning, dissolution, chlorination, and agglomeration.

The following recommendations were made by commenters regarding specific operations.

- Electrowinning should be considered beneficiation and be retained under the Bevill exclusion. The April, 1989 NPRM states that electrolytic and other chemical techniques are processing, not beneficiation, directly and inappropriately contradicting prior EPA pronouncements and regulatory action on the scope of the beneficiation exemption.
- The carbon regeneration process in which activated carbon granules adsorb gold from solution should be considered beneficiation, as these activities conclude the leaching process, and therefore constitute beneficiation.
- The Agency should specifically include dissolution in the list of beneficiation operations. For example, trona wastes produced from the "Sesqui" process are beneficiation wastes, because the dissolving and calcining operations associated with the "Sesqui" process only remove insoluble tailings wastes and drive off excess water and carbon dioxide.
- EPA should clarify its definition of beneficiation by specifically identifying "filtration" and "physical separation" as sorting to be included as part of beneficiation.
- The Agency should continue to include agglomeration as beneficiation and not limit this term to sintering because it includes other processes besides sintering, such as pelletizing and briquetting.
- EPA should define the chlorination procedure, used on some carbonaceous ores prior to leaching, as a beneficiation operation, not as processing. The chlorination procedure uses an oxidizing agent to change the chemical composition of the ore and to enhance the leaching operation.
- EPA should state that the "chloride-ilmenite" process used for titanium dioxide processing is a simultaneous ore beneficiation and chlorination process in which beneficiation and chlorination of raw ilmenite ore are inseparably combined in the same process step. EPA should confirm its previous positions that these wastes are generated from a beneficiation process.

After review of the public comments and further analysis, the Agency has concluded that, both functionally and legally, the most appropriate definition of beneficiation for use in distinguishing between beneficiation and processing is the definition used in the December, 1985 Report to Congress (RTC) on

---

[1] EPA's policy toward leaching, as stated in a previous regulatory determination (see Regulatory Determination for Wastes From the Extraction and Beneficiation of Ores and Minerals, 51 FR 24496 (July 3, 1986)) is that active leach piles and leach solutions are not wastes, but rather are raw materials used in the production process and intermediate products, respectively. Only leach solutions that escape from the production process are considered wastes while the leaching operation is active.

wastes from extraction and beneficiation of ores and minerals. This definition was, in turn, based upon a definition provided in the Effluent Guidelines Development Document. EPA believes that this definition is consistent with standard industry practice and use of the term. The RTC defines beneficiation as "the treatment of ore to concentrate its valuable constituents." [2] While the RTC did not attempt to articulate a comprehensive list of beneficiation operations, procedures or techniques, it did expound on the definition by describing beneficiation processes as including

> Physical/chemical separation techniques such as gravity concentration, magnetic separation, electrostatic separation, flotation, ion exchange, solvent extraction, electrowinning, precipitation, and amalgamation." [3]

In addition, the RTC explicitly includes leaching operations as an integral part of the extraction and beneficiation domain and labels the leachate as a "beneficiation solution." [4]

While this definition serves well as a foundation for making a distinction between beneficiation and mineral processing, the list in the RTC is not an all-inclusive list of beneficiation processes and several points of clarification are necessary regarding application of this RTC definition to real-life operations. For example, the RTC list does not include milling techniques such as crushing, grinding, washing, filtration, sorting, and sizing, or agglomeration techniques such as sintering, pelletizing, and briquetting that both industry and EPA consider to be beneficiation operations. In order to avoid further confusion, the Agency wishes at this time to identify other activities that it considers to be within the realm of beneficiation, and in particular to discuss the status of activities using heat and acid.

EPA notes here that the definitions that it has developed for today's rule represent an attempt to resolve the issues raised in public comment on the proposed rules in a reasonable and even-handed manner. The Agency recognizes that its course is not the only one available, but does believe that it provides the most equitable and workable approach to a very complicated set of issues. Furthermore, while EPA has attempted to develop consistent and reasonable definitions for and distinctions between beneficiation and processing, the Agency believes that application of these definitions must comport with common sense. In cases where a rigid application of a definition would result in an unreasonable outcome, the Agency has used best professional judgment to produce an acceptable result.

Heating steps recognized by EPA as beneficiation operations are calcining, and roasting and autoclaving of ores and minerals in preparation for leaching. All three are procedures that use heat to drive off volatiles (e.g., water, carbon dioxide, sulfur dioxide) without heating the material above the mineral's melting point and/or causing fusion (i.e. liquefying or rendering plastic by heat [5]). Operations that raise the temperature of the ores or minerals, or beneficiated ores or minerals, above their fusion or melting point, i.e., destroy the physical structure of the ore or mineral, are considered processing operations.

Calcining is often used to drive off carbon dioxide in the preparation of a final beneficiated product (e.g., talc, gypsum, lime), and for purposes of this rule is defined as the heating of an ore or mineral, or beneficiated ore or mineral to a temperature below the melting or fusion point, for purposes of driving off water (including waters of hydration) and/or carbon dioxide.

In the minerals industry, roasting serves primarily to change a sulfide ore to the oxide form, so that beneficiation by leaching or other subsequent steps may be more effectively performed. Functionally similar to roasting, autoclaving uses steam to perform heating activities (e.g., pretreating sulfide ore for leaching). For purposes of this rule, roasting and autoclaving are considered beneficiation operations if they are used to remove sulfur and/or other impurities in preparing an ore or mineral, or beneficiated ore or mineral, for leaching. Otherwise, roasting and autoclaving are defined as processing operations. Accordingly, activities such as roasting sulfide ores in preparation for precious metals heap leaching are considered beneficiation, while roasting ores or concentrates in preparation for copper, lead, or zinc smelting is specifically defined as processing.

Chlorination is sometimes used prior to gold leaching operations in a procedure functionally identical to roasting and autoclaving (i.e. to change a sulfide ore to a chemical form more amenable to leaching). EPA recognizes that this type of pretreatment operation may be an integral part of leaching operations, and accordingly, considers non-destructive chlorination of ores, minerals, or beneficiated ores or minerals when used as a pretreatment step for leaching, to be a beneficiation operation.

In contrast, heating operations such as smelting (i.e., any metallurgical operation in which metal is separated by fusion from impurities [6]) and fire-refining (e.g., retorting) are clearly and have always been considered within the realm of mineral processing. Here, the physical structure of the ore or mineral is destroyed, and neither the product stream nor the waste stream(s) arising from the operation bear any close physical/chemical resemblance to the ore or mineral entering the operation.

A specific exception to the above categorization system applies when the roasting/leaching sequence produces a final or intermediate product that does not undergo further beneficiation or processing steps (e.g., the leach liquor serves as an input to inorganic chemical manufacturing). In this type of situation, the Agency believes that the operation is most appropriately considered a processing, rather than a beneficiation, operation. In the context of this rulemaking, one candidate Bevill waste (roast/leach ore residue from primary chrome ore processing) is affected by this distinction; EPA believes that this material is clearly a waste from processing, rather than beneficiation, of an ore or mineral.

Several additional operations employ heat in combination with various acids. In EPA's view, some of these operations constitute beneficiation while others are processing. The distinction hinges upon the difference between dissolving, washing, or otherwise purifying values contained within a mineral using a dilute acid solution (beneficiation) and attacking or digesting (i.e., destroying the structure of) the ore or mineral, or beneficiated ore or mineral, using a strong acid (processing). Acid dissolution, often accompanied by heat, is used as precursor for many beneficiation operations (e.g., precipitation, fractional crystallization, ion exchange, solvent extraction). EPA recognizes this as an activity integral to many beneficiation operations, regardless of the application of heat or use of acid. For example, EPA recognizes acid washing and acid dissolution as beneficiation activities; concentrated sulfuric acid attack of titanium- or phosphate-bearing ores is considered a processing operation by the Agency.

[6] Ibid., pg 1033.

In considering the functional distinctions between beneficiation and processing using both heat and acid, EPA has examined both the range of actual practices employed, and the types of waste streams that are generated by these operations in various mineral commodity sectors. In a general sense, the lines that the Agency has drawn between beneficiation and processing parallel the common sense differences that can be observed between beneficiation and processing wastes generated using other types of mineral exploitation techniques. Most beneficiation processes, at least those immediately upstream from the initial processing operation in a production sequence, generate high volume solid waste streams that are essentially earthen in character. Despite the fact that valuable constituents have been removed, the remaining material is often physically and chemically similar to the material (ore or mineral) that entered the operation, except that particle size reduction has often occurred. Processing operations, in contrast, generate waste streams that generally bear little or no resemblance to the materials that entered the operation (with the arguable exception of smelting slags). These operations most often destroy the physical structure of the mineral, producing product and waste streams that are not earthen in character.

This common sense distinction is reflected in EPA's definitions of beneficiation and processing operations using heat and acid. The beneficiation operations (e.g., calcining, dissolution, roasting in preparation for leaching) produce wastes, where applicable, that are essentially earthen and of relatively high volume. The processing operations (e.g., smelting, acid or alkaline digestion), on the other hand, produce wastes that are not earthen, bear little resemblance to the materials that entered the operation, and are of relatively lower volume.

One final beneficiation/processing issue is the need for an absolute cut-off between processing and beneficiation, a need that was questioned by commenters. EPA continues to hold that beneficiation, especially as a functional activity which serves to concentrate the mineral value, is completed at some distinct point after which all operations are considered processing. As discussed in the April NPRM, the Agency considers any operations following the initial processing operation to be processing operations, regardless of whether the activity was included on the list of RTC beneficiation activities or has traditionally been considered beneficiation. For example, electrolytic refining, an operation often used after smelting and/or fire refining, uses procedures similar to activities listed in the RTC definition (e.g., electrowinning) or considered historically to be beneficiation (e.g., dissolution). Because, however, the operations follow previous processing operations, these activities will be considered processing and any associated wastes will be considered mineral processing wastes.

EPA acknowledges that the decision to use this beneficiation definition is a significant departure from the position taken in the October and April NPRMs, particularly with respect to the use of heat and acid. After analysis of public comments, further review of technical information regarding mineral beneficiation and processing techniques, and reexamination of the 1985 Report to Congress and 1986 Regulatory Determination, the Agency has concluded that this definition will render the most accurate, practical, and reasonable delineation between beneficiation and processing. Furthermore, the Agency expects that little environmental benefit would be gained by including these additional operation types within "mineral processing" because the Agency believes that the wastes from these operations are relatively few in number, have in a number of instances already been studied, and will in any case be addressed by the Subtitle D regulations for extraction and beneficiation wastes presently under development by the Agency.

b. *Operation must serve to remove the desired product from, or enhance the characteristics of, an ore or mineral, or a beneficiated ore or mineral.* Commenters addressing this attribute in the October 20, 1988 NPRM indicated that the language (i.e., to remove the desired product from an ore or mineral or beneficiated ore or mineral) obscured the regulatory status of certain processing operations (e.g., lightweight aggregate production) whose purpose is to change the characteristics of valuable constituents in ores or minerals without removing or concentrating them. They suggested, and EPA agreed, that the processing definition be modified to include operations that serve to enhance the desirable properties of, as well as those that remove the desired product from, an ore or mineral. EPA modified the second attribute of mineral processing to include production steps that use heat to alter the chemical composition of ores or minerals, or beneficiated ores or minerals. Many commenters addressing the April NPRM argued vehemently that EPA should not include all operations which use heat for operations other than drying in the definition of mineral processing, indicating, as discussed in the previous section, that these operations are often a part of beneficiation activities. Several commenters stated that this attribute should be written to specifically include operations that enhance the desirable properties of materials, leaving the concern of whether to include heating operations to the first attribute, which defines the delineation between beneficiation and processing.

After review of the comments and analysis of additional information, EPA has acknowledged the need to change this second attribute of mineral processing by modifying the "heat" criterion that considered production steps using heat to alter the chemical composition of ores or minerals (or beneficiated ores or minerals) to be mineral processing operations. The Agency agrees that the use of heat should not be the determining factor, primarily because many beneficiation operations use heat as a pretreatment to enhance the properties of the ore for subsequent beneficiation steps and because EPA does not wish to include operations already established to be beneficiation operations (e.g., leaching, phosphate rock beneficiation) within the domain of mineral processing, particularly if the sole reason for classifying them in this way is the use of heat. Therefore, in today's final rule, the Agency has removed its stipulation that operations using heat are automatically processing operations, but has allowed that operations that enhance the characteristics of the ore or mineral, or beneficiated ore or mineral, are mineral processing if the operations meet the other attributes.

c. *Operation uses feedstock that is comprised of less than 50 percent scrap materials. The 50 percent rule applies to all materials entering a process operation that contain the mineral value rather than all materials entering the operation irrespective of function.* The October 20, 1988 NPRM required that at least 50 percent of the feedstock to an operation be ore or mineral, or beneficiated ore or mineral, for the operation to be considered a primary mineral processing operation. Many commenters responding to that NPRM sought clarification concerning what materials are to be included as part of the "primary" feedstock, recommending that "in-process" materials derived from mineral processing should be considered "primary" feedstocks along with ores or minerals or beneficiated ores or minerals for the application of this fifty percent rule. In the preamble to the April NPRM, EPA asserted that the attribute, as presented in the October NPRM, affords (1) considerable flexibility to mineral processing operations, in that they are able to accept scrap and intermediate materials in their feedstocks and still be eligible for Bevill status, while (2) still maintaining the essential upper bound on the amount of non-ore present in a feedstock in order to ensure that wastes from operations that primarily process materials other than ores and minerals are not provided with an exclusion that Congress did not intend.

EPA also clarified in the April NPRM that the 50 percent rule applies to all mineral-value containing materials entering a process operation (e.g., crushed copper ore, beneficiated copper ore, in-process materials, and scrap copper for the copper smelters), rather than to the total of all materials (i.e., mineral values plus non-mineral materials such as fuel, reducing agents, or fluxing agents) entering the operation. EPA also clarified that the accounting period over which to analyze feedstock percentages should be one year, which allows for seasonal fluctuations, and that the rule must be applied to individual processing operations (e.g., the smelter separate from the refinery) rather than to an entire plant's operations.

The predominant comment addressing the April, 1989 NPRM again concerned the accounting for in-process materials. Several commenters reasserted that "in-process" materials derived from mineral processing and returned to the process should be considered mineral feedstock since they are used as a matter of course by the industry as feedstock because of their significant mineral value. One industry commenter disagreed with using this attribute at all, calling for EPA to abandon the fifty percent rule because it is an unrealistic and unnecessary restriction and an unwarranted intrusion into the production process.

As stated in the preamble to the April NPRM and further described above, EPA believes that the rule as written provides an extremely flexible tool for screening out secondary processors from the universe of primary mineral processors (the only group eligible for the Bevill exclusion), while allowing (1) large percentages of scrap to be used in primary processing operations and (2) seasonal and other variation in the proportions of feedstock materials without affecting the potential Bevill status of associated wastes. After reviewing the comments and also noting that this criterion does not, to EPA's knowledge, affect any wastes generated by primary mineral processors, the Agency has decided that it will make no changes in this attribute as first presented in the October NPRM and clarified in April.

d. *Operation produces either a final, or an intermediate to the final, mineral product.* The definition of processing in both the October and April NPRMs requires that, to be eligible for consideration for the Bevill exclusion, the operation must produce either a final mineral product or an intermediate to the final mineral product. EPA believes that products not directly related to mineral processing operations do not fall within the scope of the definition intended by Congress. Several commenters argued that EPA should follow Congress' intended broad view of the term "processing" and include all parts of integrated operations; no commenters, however, directly challenged EPA's position by nominating wastes arising from non-mineral-related processes that may be co-located with mineral process operations for exclusion under Bevill.

In this final rule, the Agency maintains the position articulated in the two proposals; that Congress did not intend the Bevill exclusion to extend to processing operations outside the production of an intermediate or final mineral product, i.e., a material of value derived primarily from an ore or mineral. This attribute ensures that other operations (e.g., chemical processing), even if physically located with a mineral processing operation, that produce a non-mineral product that may or may not be used as a feedstock to a mineral processing operation will not be included within the realm of mineral processing. The Agency also wishes to clarify that the distinction between intermediate and final products refers to whether the mineral value must undergo further mineral processing. Materials that are saleable, either as raw materials to other types of industrial processes (e.g., chemical manufacturing) or as finished products are considered final products. Materials that must undergo further mineral processing to be rendered saleable, or that have no significant value except as a feedstock to a mineral processing operation, are considered intermediate products. Examples of this latter category include ilmenite ore slags used in titanium production and electrowinning slimes that are processed for metals recovery.

e. *Operation does not combine the mineral product with another material that is not an ore or mineral, or beneficiated ore or mineral (e.g., alloying); and do not involve fabrication or other manufacturing activities.* The preceding attribute establishes that a mineral processing operation must produce a mineral product, whether final or intermediate. This attribute establishes that once that final product has been produced, no other operations performed on or with that product are considered to be within the realm of mineral processing, i.e., mineral processing has ended. In general, the end of mineral processing is the point at which the processed ore or mineral (1) is combined with another material that is not an ore or mineral, or beneficiated ore or mineral (i.e., combining processed ores or minerals such as steel with purified non-ferrous metals to produce an alloy is not mineral processing), (2) undergoes fabrication (e.g., manufacturing of copper wire), (3) is subjected to other manufacturing operations (e.g., chemical processing), or (4) is marketable and can be sold, even if the product must undergo further non-mineral processing prior to being amenable to an ultimate end use (e.g., titanium tetrachloride, an intermediate product used for the production of titanium metal and titanium dioxide, is saleable and is often sold to other producers for manufacturing inorganic chemicals; any operations following the production of this intermediate, irrespective of whether they occur on-site, are not considered to be within the realm of mineral processing).

The Agency believes that Congress, in adopting the Bevill Amendment, intended to include only those processes that remove, concentrate, and/or enhance values contained in ores and minerals, or beneficiated ores and minerals, and that manufacturing, chemical processing, and alloying operations clearly do not fit into this category. EPA continues to believe that the casting of anodes or cathodes is not a fabrication operation, but is instead an operation necessary for the production of an intermediate or final (i.e., saleable) product and is therefore within the realm of mineral processing.

One general view expressed by many commenters addressing both NPRMs was that EPA should follow Congress' intended broad view of the term "processing" and include all stages from beneficiation through production of final products, including integrated operations. Some commenters offered specific examples in support of their position.

For example, one commenter objected to EPA's preliminary conclusion that the production of ammoniated phosphates does not constitute mineral processing because it involves further processing of an intermediate mineral processing product, arguing that (1) production of ammoniated phosphates is enhancement of an intermediate to a final mineral product, since phosphoric acid must be further processed in order to be usable as fertilizer and (2) EPA regards ammoniated phosphate production as a part of phosphate processing under the Clean Water Act, and no rational basis exists for reaching a different conclusion under the Bevill Amendment. Other commenters similarly argued that wastes from alloying processes should be included, but nominated no large volume "post-processing" wastes.

In contrast, several other commenters argued that EPA should narrow the definition of processing via this attribute, and not finalize a definition of mineral processing that leaves virtually unchanged the extremely broad 1980 definition of mineral processing. In particular, these commenters stressed that the processing definition should not exempt operations that occur after the identity of the ore or mineral is destroyed. They stated, for example, that in production of titanium dioxide using the sulfate process a "slag" is produced from smelting beneficiated ilmenite ore in an electric arc furnace. This "slag", they argued, is a final mineral product which is then chemically processed (i.e., "washed with sulfuric acid" and "calcined"), and thus operations subsequent to the smelting should not be exempted. Similarly, the commenters argued that, in the case of titanium dioxide production using the chloride process, no wastes generated subsequent to chlorination should be eligible for the Bevill exemption, because titanium tetrachloride is the final mineral product and any subsequent operations are not to be considered processing.

Following review of these comments and additional analysis, EPA has concluded that none of the public comments received on the two proposals or any additional information received by the Agency support any substantial revisions to this attribute, though some clarifications are discussed here. The Agency maintains that Congress did not intend the Bevill exclusion to extend to processing operations that are performed after the production of a saleable mineral product. Phosphoric acid, for example, is a saleable mineral product that is purchased by diverse industries and has many uses in manufacturing and as a feedstock for further chemical processing. Thus, the manufacture of ammoniated phosphate fertilizer by adding ammonia to phosphoric acid, is not a mineral processing operation; this is chemical processing that uses a saleable mineral product as a feedstock. Likewise, EPA considers titanium tetrachloride, produced during the titanium chloride process, to be a saleable product; any processing subsequent to its production is considered to be chemical processing. In contrast, titanium-bearing slag generated in blast furnaces is considered eligible for continued Bevill exclusion, because although it is a saleable intermediate product, it has no significant end use except for additional mineral processing. Accordingly, the processing of this slag using sulfuric acid digestion is a mineral processing operation rather than a chemical processing operation, and all qualifying wastes from this process are Bevill wastes.

4. Residuals From Treatment of Excluded Mineral Processing Wastes Are Eligible for Exclusion Provided That They Meet the High Volume and Low Hazard Criteria

The October and April NPRMs both articulated EPA's intention to include as processing wastes the residuals from the treatment of excluded mineral processing wastes, but only if those residuals independently meet the criteria for special waste status. Several commenters specifically suggested that for clarity EPA should list for study, in the regulation itself, the category "residues from the treatment of all mineral-processing wastes on the preceding list which are generated at a rate greater than the high volume criterion established by EPA." Other commenters argued that the special waste criteria should not be applied to treatment residuals, recommending that EPA include in the regulation itself on the list for study "residues from the treatment of all mineral processing wastes on the preceding list regardless of the rate of generation." One commenter noted that treatment and discharge of process water in its industry is limited by the Clean Water Act and, as a result, treatment residuals are limited in volume and thus do not meet the high volume criterion because of other regulatory demands. Another claimed that EPA must evaluate actual waste management practices and impacts to human health and the environment before deciding that residuals are subject to subtitle C. Finally, one commenter stated that EPA should be consistent in applying its definition of process wastewater and include aqueous pollution control residuals with process wastewaters, claiming that EPA provided no rationale for the statement that process wastewater does not include aqueous waste streams from pollution control devices.

After review of the comments, EPA continues to believe that the most appropriate interpretation of the term "solid waste from the processing of ores and minerals" should include pollution control residuals that are presently generated as long as such residuals meet the high volume and low hazard criteria required for all excluded wastes. By including qualifying pollution control residuals on the list of wastes excluded under the Bevill Amendment, the intent of Congress will be achieved by allowing further study of these high-volume, low-hazard wastes. EPA does not believe it appropriate to treat low volume pollution control residuals as exempt wastes regardless of the reason why these wastes are not generated in high volumes.

5. The Processing Definition Could Be Narrowed by Adding a Co-Location Requirement

In the April NPRM the Agency solicited comment concerning whether the definition of "mineral processing" should be further narrowed by confining "mineral processing" to only those mineral processing operations that are co-located with extraction and beneficiation operations. Some commenters encouraged EPA to narrow the definition of processing and include only those processors that are co-located with beneficiation operations, stating that: (1) The co-locational requirement is an inherent aspect of the Bevill exemption, (2) the legislative history never indicated that wastes generated at locations divorced from extraction and beneficiation sites should be exempted, (3) that Congress never intended non-mining industries (e.g., the chemical industry) to have Bevill-exempt wastes, and (4) EPA itself, in the 1980 interpretation, indicated only wastes that are co-located should be exempted.

Many other commenters insisted that EPA do nothing to further narrow the definition of processing, especially by limiting the exemption to processors that are co-located with beneficiation operations. They contended that: (1) This narrowing would be inconsistent with the language of the Bevill

Amendment, the intent of Congress, and the interpretation of the Court, (2) wastes will exhibit the same intrinsic high volume, low hazard, and other characteristics regardless of their location relative to extraction and beneficiation operations, (3) if the Agency ignores site characteristics which directly affect risk (i.e., hazard) potential, then site characteristics which have no effect on risk—such as co-location, must also be disregarded, (4) if EPA relies on the special waste concept to define processing, then the Agency must recognize that the 1978 proposal as well as EPA's Draft Background Document do not give any indication that only processing operations at integrated facilities should be eligible for the Bevill exclusion, (5) many if not most sectors ship from mines to beneficiation and/or processing facilities, (6) co-location could threaten the environment if processing facilities are moved to the sensitive areas in which mines are often located, and (7) no significant domestic extraction or beneficiation occurs in some sectors, making it impossible to perform the processing (e.g., chromite ore roasting/leaching, manufacture of hydrofluoric acid) in close proximity to beneficiation anywhere in the U.S.

After further review, EPA has decided that a further narrowing of the processing definition using a co-location criterion or any other limitation is not appropriate or required by Congressional intent as reflected by the legislative history. Furthermore, the co-location requirement could conceivably create major inequities between facilities within sectors because some facilities in a sector may be co-located while others are not, and between sectors because some sectors rely entirely on foreign ore supplies and others do not; the volume or hazard of wastes in these sectors are largely unaffected by the location of the extraction and beneficiation operations providing their feedstocks. Therefore, EPA will continue to use the definition delineated above (i.e., solid waste uniquely associated with mineral processing and meeting all of the five attributes of mineral processing) and has not employed any additional criteria that would narrow the definition of "mineral processing."

E. Related RCRA Issues

1. Applicability of the Mixture Rule

The April 17, 1989 NPRM stated that EPA would apply the mixture rule to Bevill and non-Bevill mixed waste streams under almost all circumstances. Under this policy, mixtures of one or more listed hazardous wastes and a large volume, low hazard mineral processing waste would be considered a hazardous waste unless and until the mixture is delisted. EPA proposed, however, that in the case of mixtures of non-excluded "characteristic" wastes and Bevill wastes, the mixture would be considered a hazardous waste if it exhibits one or more of the same hazardous characteristics that are exhibited by the non-excluded waste. If, on the other hand, the mixture exhibits one or more hazardous characteristics exhibited by the Bevill waste but not by the non-excluded characteristic waste, then the mixture would not be a hazardous waste. Furthermore, mixing a characteristic hazardous waste with a Bevill waste would constitute treatment of a hazardous waste, and would be subject to the appropriate regulation for the treatment, storage, or disposal of hazardous wastes, including obtaining a permit.

Several commenters asserted that the Agency's preliminary position on the mixture rule is inappropriately lax and should be modified to regulate co-managed waste mixtures more stringently. These commenters argued that mixtures of Bevill and non-Bevill wastes do not meet the low hazard criterion for Bevill exclusion. Commenters also stated that co-management typically occurs subsequent to initial processing, and thus does not fall within the scope of the Bevill exclusion.

Other commenters argued that the proposed application of the mixture rule is overly strict. These commenters stated that applying the mixture rule as proposed would discourage environmentally protective co-management. Commenters specifically recommended that mixtures of non-Bevill characteristic or listed wastes and Bevill wastes be regulated as hazardous only when the resulting mixture (1) demonstrates a hazardous characteristic not exhibited by the Bevill waste, or (2) is more hazardous than the Bevill waste alone. These commenters stated that the Agency should exempt mixtures of characteristic or listed mineral processing wastes with Bevill wastes when the disposal of the Bevill waste is subject to the requirements of a State or Federal program to control groundwater contamination, provided that the waste is completely characterized such that the effects of mixing on the non-exempt waste can be assessed and considered by the applicable regulatory agency.

Other commenters argued that regulating mixtures of subtitle D extraction and beneficiation wastes and non-Bevill mineral processing wastes under subtitle C contradicts EPA's July 3, 1986 Regulatory Determination that extraction and beneficiation wastes will be excluded from all aspects of the regulatory program. These commenters requested that the Agency provide a reason for not complying with the Regulatory Determination. In urging the Agency to exempt mixtures of extraction and beneficiation wastes and non-Bevill mineral processing wastes from the subtitle C mixture rule, these commenters drew an analogy to the fact that the Agency has consistently maintained that mixtures of Bevill utility wastes and non-Bevill utility wastes are not subject to regulation under subtitle C. Other commenters, noting that the Agency is concerned that industry might dilute their subtitle C processing wastes with extraction and beneficiation wastes to avoid subtitle C regulation, suggested that the Agency prohibit intentional dilution of hazardous waste streams for the purpose of avoiding subtitle C regulation. These commenters contended that this approach has been taken in the Land Disposal Restrictions Program, and has been endorsed by the D.C. Circuit Court in regulations concerning multi-source leachate.

Some commenters stated that requiring a treatment, storage, or disposal permit when mixing characteristic hazardous wastes with Bevill wastes is particularly onerous. These commenters argued that requiring a permit when mixing wastes would render any relief made available under the proposed modifications to the mixture rule meaningless. Other commenters recommended that immediate elementary neutralization of a RCRA corrosive waste with a Bevill waste should be exempt from RCRA permitting requirements. These commenters argued that such a mixture exhibits no hazardous characteristics, the treatment is instantaneous, and the entire mixture would be inappropriately regulated under subtitle C.

Several commenters recommended that the Agency exempt *de minimis* mixtures of listed hazardous wastes with other mining wastes. These commenters asserted that such a policy would be consistent with the Agency's position regarding the derived-from rule and would result in enhanced protection of the environment. These commenters stated that *de minimis* mixing is sometimes performed in order to comply with NPDES requirements. Other commenters stated that a *de minimis* exemption would be consistent with the findings of the Agency's first Report to Congress, which found that subtitle C regulation of these waste streams was unnecessary.

Some commenters argued that the proposed modifications to the mixture rule conflict with Congressional and Court ordered requirements to perform studies of particular waste streams. These commenters stated that all processing wastes are temporarily exempt from all provisions of subtitle C—including the mixture rule—until the special study is completed and a Regulatory Determination is completed. Other commenters contended that the Court interpretation of the legislative intent of the Bevill Amendment supports the argument that the beneficial effects of waste mixing should be incorporated into the low hazard criterion, and if insufficient data are available to do so, then the Agency should further study the effects of mixing practices.

Finally, commenters argued that particular waste streams and classes of wastes should not be subject to the modified mixture rule and that they should remain eligible for the Bevill exclusion. Waste streams include bauxite red mud mixed with red scale, Lurgi wet scrubber effluent mixed with alkaline tailings at primary copper facilities, minor waste streams from the electrowinning and refining of gold mixed with tailings, and small amounts of waste mixed with sulfuric acid storage tank clean-out and recirculation water from phosphate processing.

The Agency has reviewed and considered these comments, and has concluded that it is consistent with the intent of Congress and the Court, and most protective of human health and the environment, to continue to apply the mixture rule to Bevill and non-Bevill mixed waste streams as described in the April 17, 1989 NPRM. Only in this way can the Agency ensure that an unintended regulatory exclusion is not afforded (e.g., through intentional dilution with high volume Bevill wastes) to small volume hazardous mineral processing wastes that should rightly be subject to Subtitle C requirements. By so doing, mixtures of small volume mineral processing wastes and Bevill wastes are potentially subject to subtitle C requirements, and the act of mixing them will require a subtitle C treatment permit. For the same reasons, EPA also does not see any reason to carve out particular exceptions for the waste stream mixtures cited by commenters.

Because many facilities may lack historical knowledge of the relevant concentrations of constituents and volumes of the characteristically hazardous non-excluded pre-mixed solid wastes, and pre-mixed Bevill wastes comprising the characteristically hazardous Bevill waste mixtures, EPA does not believe that a baseline risk approach is feasible. This also is why EPA's approach to these characteristic mixtures differs from the approach retained today regarding listed mixtures. (See also the discussion regarding utility wastes above). Further, concerns over enforceability of alternative approaches have convinced EPA that the approach adopted here is necessary to assure that nonexcluded characteristically hazardous wastes are properly managed and are not improperly mixed with Bevill wastes so as to avoid regulation.

The argument that EPA's position is in conflict with the 1986 Regulatory Determination for extraction and beneficiation wastes or Congressional and Court directives regarding these Bevill wastes is specious; the issue at hand is regulation of low volume hazardous mineral processing wastes, not regulation of Bevill wastes. Non-Bevill mineral processing wastes that are hazardous are subject to all aspects of the subtitle C regulations, including the mixture rule. Mixtures of Bevill and non-Bevill processing wastes will be treated in the same manner, notwithstanding the fact that EPA has not yet studied Bevill processing wastes. Further, even were EPA to agree that the mixture rule were inapplicable to the Bevill waste mixed with hazardous waste, mixtures of listed hazardous wastes with Bevill wastes would continue to be subject to regulation because the "mixture" would "contain" listed hazardous waste, subject to regulation unless delisted. See *Chemical Waste Mgmt., Inc.* v. *EPA,* 869 F.2d 1526 (D.C. Cir. 1989).

Moreover, the Agency finds no compelling reason to provide exemptions for particular small volume wastes that may be associated with mineral processing operations, such as cleaning wastes. Many other industrial operations also generate such wastes, and EPA does not believe that the fact that current management involving co-management justifies continued regulatory exclusion for wastes that are not uniquely associated with mineral processing (and therefore are not defined as mineral processing wastes) and would not, in any event meet the high volume criterion.

Finally, providing regulatory exclusions for mixtures of Bevill and non-Bevill mineral processing wastes would provide disincentives for developing ways to minimize hazardous waste generation. This would be in direct conflict with one of the Agency's major policy goals, that of pollution prevention.

2. Applicability of the Derived-From Rule

The April 17, 1989 NPRM stated that the Agency will clarify the application of the derived-from rule in a supplemental notice (expected in mid-1989) to the May 6, 1987 proposed rules for boilers and industrial furnaces burning hazardous waste. In the interim, the proposal stated that the Agency would adhere to its prior statements on this issue, i.e., that wastes from comanaging hazardous wastes and Bevill materials remain within the scope of the Bevill exclusion so long as the character of the residues is not significantly affected by the hazardous waste management activity. To the extent that co-combustion residues are significantly affected, they could no longer be considered to truly arise from processing an ore or mineral (or from other activities addressed by the Bevill Amendment). See 50 FR 49190 (November 29, 1985); 52 FR 17012–13 (May 6, 1987) for further information.

Many commenters responded to the proposed rule by requesting that the Agency immediately clarify its position on the derived-from rule and provide a supplemental notice to the final rule for boilers and industrial furnaces. Other commenters argued that Congress clearly did not intend for the Bevill Amendment to exempt the burning of hazardous wastes in smelter furnaces. These commenters further argued that the Agency's position on the derived-from rule rewards dilution as a means of disposal and is unlawful and overly broad. Commenters suggested that if the Agency determines that combustion residuals from burning hazardous waste with Bevill exempt materials are in fact exempt from Subtitle C, then the Agency should include an assessment of the potential health and environmental impacts of burning in the Report to Congress.

Other commenters stated that wastes from industrial furnaces burning hazardous waste fuel should remain under the Bevill exclusion as long as the character of the residue is not significantly affected by the management activity. These commenters argued that the air pollution control residues from hazardous waste-fired kilns are Bevill wastes just as are residues from coal-fired kilns.

The Agency has reviewed and evaluated these comments regarding the derived-from rule. As indicated in the April NPRM, EPA will clarify the application of the derived-from rule in a supplemental notice to the May 6, 1987 proposed rules for boilers and industrial furnaces burning hazardous waste. We expect this notice to be published during the next several months. Until then, wastes from co-managing hazardous wastes and Bevill materials remain within the scope of the Bevill exclusion so long as the character of the residues is not significantly affected by the waste management activity.

Effects of the Land Disposal Restrictions

Commenters argued that the Agency has misinterpreted the land disposal restrictions (LDR) as they relate to mineral processing. According to commenters, the LDR will not be automatic for non Bevill mineral processing wastes that exhibit hazardous characteristics as of May 1990. Also, these commenters stated that EPA's statutory mandate to conduct a detailed and comprehensive review of mineral processing wastes requires the Agency to take into account the potential effect of the LDR rulemaking. If the Agency considers eliminating the Bevill exclusion as applied to a particular materials stream, it should, according to these commenters, only do so in the context of a land ban BDAT determination.

The statutory mandate to conduct a detailed and comprehensive review applies only to Bevill wastes, not to the other mineral processing wastes removed from Bevill by today's final rule. Therefore, EPA is under no obligation to consider the effects of potential land disposal restrictions on mineral processors prior to removing non-Bevill mineral processing wastes from the exclusion.

A further question exists as to the status of the wastes withdrawn from the exclusion under the land disposal restriction provisions that establish a schedule for prohibiting untreated hazardous wastes from land disposal. Once withdrawn from the Bevill exclusion, these wastes will be identified as hazardous if they exhibit a hazardous waste characteristic; none will be listed (at least at this time). The statute provides with respect to wastes identified because they exhibit a hazardous waste characteristic that EPA must promulgate prohibitions and establish treatment standards for "all hazardous wastes identified under 3001" by May 8, 1990. RCRA section 3004 (g)(4)(C). (EPA interprets this language as referring to the wastes identified as hazardous as of November 8, 1984, the date of enactment of the HSWA amendments because they exhibit one or more hazardous characteristics.) Wastes newly identified after November 8, 1984 must be prohibited from land disposal, and EPA must develop a treatment standard for them, within six months after they are newly identified. RCRA section 3004 (g)(4).

EPA believes that the wastes withdrawn from the exclusion are "newly identified" for purposes of these provisions. Although technically the wastes are not being identified by a new characteristic, they are being brought into the subtitle C system after the date of the 1984 RCRA amendments. The Agency plans to address wastes brought in under subtitle C by this rule further in the proposed land disposal restrictions for the Third scheduled wastes.

However, because any hazardous waste, including newly identified wastes, is subject to the requirements of the California List and Solvents and Dioxins final rules, the most important question is how the State programs are affected. Today's final rule removing certain mineral processing wastes from the Bevill exclusion is not being imposed pursuant to the HSWA and therefore today's rule is not effective in authorized states. Thus, as discussed more fully below, today's regulation is applicable only in those states that do not have interim or final authorization. Authorized states that do not have a Bevill exclusion or analog, i.e., all mineral processing wastes are already eligible for regulation as hazardous wastes by the state, are already subject to the land disposal restrictions for California List and Solvents and Dioxins wastes.

4. RCRA Section 3004(x)

As part of the 1984 HSWA Amendments, Congress incorporated a provision allowing the EPA Administrator to relax certain of the Subtitle C standards contained in the new amendments as they relate to the management of mining wastes, utility wastes, and cement kiln dust wastes. This provision, found at section 3004(x), is commonly called the "Simpson Amendment." The Simpson Amendment allows EPA to modify the minimum technical standards for the design, construction, and operation of waste management units, land disposal restrictions, and corrective action requirements for continuing releases, as long as protection of human health and the environment is assured. In the April 17, 1989 NPRM the Agency explained that the provisions of the Simpson Amendment, and hence the opportunity for flexible application of Subtitle C requirements, apply only to the special wastes identified in the statute. Accordingly, the Simpson Amendment would not apply to wastes that are not special wastes and that would therefore be removed from the Bevill exclusion by the proposed rule.

Commenters argued that EPA's interpretation of the Simpson Amendment as applicable only to wastes retained within the Bevill exemption is incorrect and contrary to the legislative history. These commenters asserted that the legislative history of the Simpson Amendment indicates that it was meant to apply to all mining wastes and that its purpose was to clarify the Agency's authority to develop special standards for wastes removed from the Bevill exemption. On this basis, these commenters urged EPA to adopt a broader position.

Other commenters argued that EPA's reliance on a 1984 Senate report to narrow the scope of the Simpson Amendment is questionable. Because the Simpson Amendment was adopted at a time when EPA's November 1980 interpretation of the Bevill Amendment was the controlling authority, and Congress did not take any action to limit or modify the November 1980 interpretation, "processing" must be understood, according to these commenters, to include wastes from milling, smelting, and refining of ores and minerals. Furthermore, according to these commenters, Congress recognized that some, but not all, special study wastes might become subject to subtitle C, in which case differential treatment under the Amendment would be appropriate.

After reviewing these comments and the intent of the Simpson Amendment, the Agency believes that the provisions of section 3004(x), and hence, the opportunity for flexible application of Subtitle C requirements, apply only to the wastes intended by Congress to be included within the Bevill Amendment exemption, i.e., the special wastes. Accordingly, section 3004(x) would not apply to wastes that are not special wastes and that would therefore be removed from the Bevill exclusion by this rulemaking.

EPA's interpretation of the scope of section 3004(x) is based upon a reading of the legislative history of the amendment. The legislative history is replete with references that 3004(x) was designed to allow flexibility to modify subtitle C for those wastes within the scope of the Bevill amendment, i.e., the special wastes. The Conference Report accompanying 3004(x) explains clearly that it would

> Encompass all of the so-called "*special study wastes*" described in section 8002 (f), (n), (o), and (p) that become subject to regulation under subtitle C. * * * This amendment recognizes that even if some of the *special study wastes* are determined to be hazardous it may not be necessary or appropriate, because of their special characteristics and other factors, to subject such wastes to the same requirements that are applicable to other hazardous wastes, and that protection of human health and the environment does not necessarily imply the uniform application of requirements developed for disposal of other hazardous wastes."

Conf. Rpt. at 93 (emphasis added). The adoption of section 3004(x) is fully consistent with Congress' concern in 1980 that the special wastes may not necessarily be amenable to full Subtitle C controls due to the large volumes and potentially lower hazards. Such concerns would not hold for wastes which are not high volume, low hazard, and the Conference Report suggests that Congress was not concerned with applying section 3004(x) to such wastes.

The Conference Report goes on to explain that the authority of section 3004(x) "is intended to extend to all of the wastes *required to be studied by EPA* pursuant to section 8002 (f), (n), (o), and (p), and does not in any way alter *the existing scope* of section 3001(b)(3)(A)." *Id.* at 94 (emphasis added). Several commenters cited this language to indicate that the 3004(x) was designed to apply to all wastes which EPA defined within the scope of the Bevill amendment as of 1984, i.e., all mineral processing wastes regardless of volume or hazard. EPA does not agree the language can be so read. The Court of Appeals clearly ruled in EDF II that Congress never intended the Bevill Amendment to apply to wastes which are not high volume, low hazard special wastes. Thus, even in 1984, the "existing scope" of section 3001 was not as broad as EPA was interpreting it. Congress intended section 3004(x) to apply to those wastes within the scope of the Bevill amendment as Congress, not EPA, interpreted it (i.e., special wastes). EPA notes that the 1983 Senate Report referred to in the April NPRM supports this conclusion, but is not the sole basis for it.

In light of the decision of the Court of Appeals construing Congress' intent in adopting the Bevill amendment in 1980 (prior to the Simpson amendment), the proper reading of section 3004(x) is that it applies only to special wastes as defined by today's final rule. However, EPA does recognize that for certain wastes which are high volume, but also high hazard, there may be valid concerns regarding the amenability of certain subtitle C controls. EPA would appreciate receiving any information regarding these effects in industries affected by today's rule.

F. Administrative Issues

1. Subtitle C and Wastes Withdrawn From the Bevill Exclusion

Commenters recommended that the Agency clarify that surface impoundments managing processing wastes removed from the Bevill exclusion and exhibiting a hazardous characteristic will have four years, as provided for in section 3005(j)(6), to comply with the Minimum Technology Requirements (MTRs). These commenters were concerned that mineral processors newly subject to subtitle C would have to meet the MTRs under the LDR Program.

Other commenters recommended that the Agency impose subtitle C regulations on facilities that fail to properly close and secure units in accordance with all currently applicable requirements within the six month compliance period proposed in the NPRM. As an alternative, these commenters recommended that the Agency require affected facilities to implement a RCRA ground-water monitoring program to assure detection of threats to human health and the environment. Without assurance that no contamination was present, according to these commenters, Subtitle C closure and post-closure requirements must be met so as to characterize and remediate any potential human or environmental threats.

Section 3005(j)(6) provides that surface impoundments that become eligible for interim status after November 8, 1984 as a result of receiving wastes that are hazardous as a result of "additional listings or characteristics for the identification of hazardous waste under section 3001" must comply with MTRs within four years of promulgation of the new listing or characteristic. The wastes that are no longer subject to the Bevill exclusion are not being brought into the subtitle C system as a result of newly promulgated listings or characteristics, but EPA believes that the intended purpose of section 3005(j)(6) is to allow surface impoundments that are newly eligible for interim status after November 8, 1984 to have the same four years to close or retrofit afforded interim status impoundments in existence on November 8, 1984. Consequently, EPA believes that section 3005(j)(6) does apply to the impoundments receiving wastes newly brought into the subtitle C system as a result of today's action. EPA notes that it is adopting a similar construction of section 3004(g)(4) and thus is also viewing these wastes as newly identified for purposes of the land disposal restrictions program. In the event that there are inconsistencies between requirements under 3005(j)(6) and the land disposal restrictions program, they will be addressed by EPA when the Agency promulgates land ban requirements for these wastes.

2. Opportunities for Public Comment

In the April 17, 1989 NPRM, the Agency provided the public with a 45 day public comment period, during which time the Agency accepted written comments submitted to the Docket Information Center and held a public hearing in Washington, DC. Commenters asserted that by scheduling only one hearing location and date the public was denied full access to the public comment process. Other commenters argued that the public comment period was too short to allow the public adequate opportunity to review and comment on the NPRM. These commenters stated that an additional 30 days should have been allowed for public comment.

The Agency disagrees with these commenters. While the opportunities for public review and comment on the April 17, 1989 NPRM were more limited than the Agency customarily provides, the Agency believes that these opportunities were nonetheless adequate. Furthermore, the public review and comment schedule was driven by the Court-ordered schedule, which prevented the Agency from providing a longer public comment period or additional public hearings. In addition, for many issues, there have been multiple comment periods.

3. Executive Order 12291 Analysis

In the April 17, 1989 NPRM, the Agency explained that section 8 of Executive Order 12291 exempts an agency from the requirements of the Order when compliance would conflict with deadlines imposed by statute or judicial order. Accumulating the information and conducting the analyses required to fully comply with the requirements of sections 2 and 3 of Executive Order 12291 takes many months. Therefore, compliance with these requirements in preparation for the October and April proposed rules was not possible within the schedule specified by the Court for this rulemaking. In the NPRM, the Agency explained that although EPA could not conduct a complete economic impact analysis within the period of time allowed by the Court, the Agency's economic impact analyses conducted in support of previous Agency rulemaking and Report to Congress activities did suggest that the proposal might well not meet the criteria for a "major" rule.

BEST COPY AVAILABLE

Commenters argued that the Agency is in fact compelled to prepare an economic analysis for this rulemaking. These commenters asserted, without providing alternative analyses or information in support of the assertion, that the rule would qualify as a major rule under each of the three tests used to determine impact under Executive Order 12291. Some commenters argued that the Court clearly indicated that the Agency is required to consider costs and benefits in making Bevill decisions (see e.g., EDF I at 1315). Commenters recommended that if the Agency requires additional time to prepare an economic impact analysis, it should request an extension from the Court.

As discussed above and in the October and April proposals, the Agency does not have adequate time to prepare a complete RIA that is fully responsive to E.O. 12291 in connection with this rulemaking. Moreover, the Agency has not received convincing arguments or information that suggest that the rule, in either proposed form or in the form finalized today, would constitute a "major rule," at least not in terms of aggregate financial impacts in excess of $100 million annually. As far as any obligation to consider economic impact in making Bevill exclusion decisions is concerned, EPA's reading of the court decision in EDF I is that economic effects and all of the other RCRA 8002(p) study factors must be evaluated in the Report to Congress and considered in making the regulatory determination for Bevill mineral processing wastes, but not in identifying the mineral processing wastes that satisfy the Bevill criteria in the first instance. Finally, because EPA is capable of discharging its duties within the time period allotted by the Court, the Agency does not believe that a schedule extension for purposes of conducting an impact study that is not required is appropriate.

Commenters stated that the Agency does not have a basis for claiming that the rulemaking will not constitute a major rule, and therefore that the rule does require a Regulatory Impact Analysis. Sufficient information, according to commenters, was provided to the docket after the October 20, 1988 proposed rulemaking. These commenters stated that the Department of Interior (DOI) has indicated that it possesses the necessary data for conducting a Regulatory Impact Analysis.

EPA disagrees that the information that has been submitted to the docket demonstrates that this action constitutes a major rule. In fact, although the Agency had requested specific information in the October and April proposals regarding low volume processing wastes that would or might be affected by today's rule, virtually no specific data on such wastes was received in public comment on these proposals. Through past cooperative work with the U.S. Bureau of Mines (BOM), EPA is well aware of the types of information available from DOI concerning mineral processing wastes. While very comprehensive information on numbers and identities of facilities and production and sales volume data are available from BOM, the Bureau has very little information on other variables that are critical to a complete evaluation of regulatory and economic impact, such as waste types, volumes, and characteristics, and waste management practices.

The Agency has made a good faith effort to comply with the requirements of Executive Order 12291 by conducting a comprehensive economic impact screening analysis, as presented below in Section VIII.

4. Regulatory Flexibility Analysis

In the April 17, 1989 NPRM, the Agency explained that Section 608 of the Regulatory Flexibility Act (RFA) allows the Administrator to waive or delay completion of the RFA screening analysis in response to an emergency that makes compliance with the requirements of section 603 or the Act on a timely basis impracticable. In this instance, the court-imposed deadlines for publication of the October and April proposed rules have prevented EPA from conducting a complete screening analysis of potential small business impacts in time to support the rulemaking process, especially given that more than 100 mineral commodity sectors would have required screening for potentially hazardous waste and the presence of significantly affected small business entities. In both the October and April NPRMs the Agency solicited comment and specific information relating to specific small businesses or individual commodity sectors that produce ore or mineral processing wastes that could, by virtue of the potential hazardous characteristics of such wastes, be subject to adverse impacts by today's rule.

Commenters responded by stating that the Agency has inadequately evaluated the rule's impact on small businesses, but no commenters provided any specific information related to small business firms or potentially affected sectors. Nonetheless, these commenters stated that the Agency should recognize that enterprise ownership patterns vary appreciably between mineral-industry sectors, and therefore, the extension of information from the nonferrous and ferroalloy producing sectors to the nonmetallic ore and mineral processing sectors is inappropriate. These commenters asserted that the Bureau of Mines could provide information necessary to support a screening study.

In section IX of this preamble, the Agency presents a comprehensive analysis of the impacts of this rulemaking on small businesses.

G. Comments Addressing Nine Wastes for which Final Bevill Status is Established by Today's Rule

This section summarizes public comments received by EPA addressing nine potentially high volume wastes on which the Agency proposed to take final action in the April NPRM. EPA's decisions regarding the Bevill status of these materials are presented in section IV, below, though responses to a limited number of specific questions and issues raised by commenters are addressed in this section.

1. Slag From Primary Copper Processing

Several commenters supported EPA's proposal to retain primary copper smelting slag within the Bevill Amendment exclusion as a high volume, low hazard mineral processing waste. They noted that slag from primary copper smelting constitutes a low hazard waste according to a study supported by EPA. They further agreed that all types of copper processing slag (i.e., reverberator furnace, converter, and refining slag) should be aggregated to meet the volume criterion. One commenter stated that its anode and converter slag is not discarded but recycled to smelters and claimed this to be a standard practice at U.S. smelters. That same commenter noted that its reactor slag is an intermediate product that is processed in a slag concentrator using beneficiation activities (i.e., cooling, grinding, flotation) and that other facilities either discard or clean the slag. They claimed that water extract tests in which only one of 15 samples exceeded EP toxicity levels have demonstrated that the waste is low hazard.

Other commenters disagreed with EPA's proposal to retain copper slag. They indicated that the waste sampling effort conducted for the draft mineral processing waste Report to Congress revealed that one of the eleven samples of copper slag exhibited the EP toxicity characteristic. In addition, the waste contained elevated leachable levels of arsenic, cadmium, and lead. Water

extraction sampling also revealed that the waste contains leachable arsenic and cadmium at concentrations exceeding the EP trigger level. They noted that data from the draft Report to Congress demonstrate exceedances of the AWQC for copper smelting slag; cadmium exceeds the AWQC by up to 9,000 times, copper by up to 9,000 times, and lead by up to 15,000 times.

One commenter who in the past used copper slag for construction purposes in the state of Washington objected to the inclusion of slag from primary copper smelting, specifically objecting to the classification of copper smelting slag as nonhazardous. This commenter contended that contamination caused by copper smelting slag in the Tacoma, Washington area has been documented in numerous reports. In 1983, they claimed, the Tacoma Pierce County Health Department issued a notice advising against consumption of bottom fish from the Hylebos waterway and against regular consumption of fish from other waterways in the area because of the presence of arsenic and lead in fish caused in part by smelting slag.

EPA today finalizes the decision to leave copper slag within the exclusion for study. Data recently collected by EPA (using Method 1312) confirms that this waste passes the hazard screening criterion. Furthermore, 1310 data developed from the same sample fails to confirm the results cited by the commenter.

2. Slag From Primary Lead Processing

A commenter supported EPA's proposed retention of lead processing slag, but indicated a concern that only smelting and not refining slag may have been included. They requested that if this is EPA's position, that the Agency modify its definition to include refining slag.

Other commenters disagreed with EPA's proposal to include lead slag, arguing that slag from primary lead processing cannot be considered low hazard under any reasonable definition. They indicated that the waste sampling effort conducted for the draft mineral processing wastes Report to Congress revealed that all five of the plants generating this waste and thirteen of seventeen samples of slag from lead processing exhibited the EP toxicity characteristic. Two of the five facilities failed for cadmium; three of the five facilities and eight of the 17 total samples exceeded the drinking water standard for lead by more than 1000-fold; and one of the plants exceeded 100 times the drinking water standard for cadmium even when leached with water. All samples of granulated or hot dumped slag exhibited the EP toxicity characteristic; only the dezinced slag passed the characteristic test. They noted that data from the draft Report to Congress demonstrate exceedances of the AWQC for copper smelting slag; cadmium exceeds the AWQC by up to 8,000 times, zinc by up to 2,100 times, and lead by up to 66,000 times.

EPA today finalizes the decision to leave lead slag within the exclusion for study. Data recently collected by EPA (using Method 1312) confirms that this waste passes the hazard screening criterion at three facilities. The data cited by the commenters is not determinative of whether the waste will remain within the exclusion under today's screening criterion.

3. Red and Brown Muds from Primary Bauxite Processing

Commenters supported the Agency's proposed retention of red and brown muds from bauxite refining within the mining waste exclusion. They agreed that red and brown muds satisfy the definition of mineral processing and meet the low hazard and high volume criteria. The commenters further claimed that should red and brown muds incorrectly be classified as hazardous waste, a large share of the hazardous waste storage capacity in the U.S. would be consumed with no increased benefit or protection to the environment. One commenter further argued that this waste is from a mineral beneficiation, not mineral processing waste.

Red and brown muds are created by an alkaline digestion operation; they therefore constitute mineral processing wastes.

4. Phosphogypsum From Phosphoric Acid Production

A number of commenters supported EPA's proposal to retain phosphogypsum within the Bevill exclusion. They agreed that phosphogypsum meets the high volume and low hazard criteria and should be retained in the Bevill exclusion. Additionally, they contended that compliance with subtitle C requirements, including land disposal restrictions, in the management of phosphate rock is not possible. Where technologically feasible, compliance would require expenditures that cannot be sustained by the fertilizer industry. Several industry commenters claimed that the exclusion for phosphogypsum will be meaningless if the rainwater falling on these stacks also is not exempted, noting that the collection of this rainwater runoff is an integral part of the processing of phosphate rock as this processing could not legally occur if the runoff was not collected and managed in accordance with the NPDES program.

Commenters argued further that phosphogypsum should not be considered separately from the recirculating process water with which it is linked. Process water is used to convey phosphogypsum to management areas and serves a critical function in maintaining water balance. Water used to transport phosphogypsum is generated at a different point in the production process only where it is recirculated. The commenters asserted that separate consideration of phosphogypsum and process wastewater does not comport with the Agency's historical approach to the Bevill Amendment.

Other commenters, in contrast, criticized EPA's proposal to retain phosphogypsum from phosphoric acid production within the Bevill exclusion. They claimed that phosphogypsum, under any reasonable definition, is not low hazard. Of the 10 plants sampled in a study contracted by EPA, 14 of 19 samples exceeded 100 times the MCLs for alpha particle radioactivity, radium-226, or both. Furthermore, adequate data exist to document the health risks associated with radioactive uranium and phosphate wastes. They asserted that: (1) EPA data indicate that the health risks from phosphogypsum stacks and ponds exceed the Agency's acceptable levels by a factor of eight, (2) phosphogypsum piles are located in areas of heavy rainfall where leaching of wastes occurs, and (3) the piles are located in heavily populated areas and in close proximity to ground water. Therefore, they contended, phosphogypsum should be regulated as a hazardous waste. EPA's failure to consider radionuclides as hazard is arbitrary, especially since EPA has previously recognized that waste with 20pCi/g constitutes more than a low level hazard and the EPA Draft Background Information Document entitled "Radionuclide Emissions from Phosphogypsum Stacks-Risk Assessment" shows phosphogypsum to have an average radium 226 concentration of 31 pCi/g, plus significant levels of other radionuclides. The commenters also expressed concern over the disposal of phosphogypsum filter pan residue on these piles as the residue has concentrations of radionuclide 2 to 3 orders of magnitude higher than normal phosphogypsum.

EPA has reviewed these comments and has elected to retain phosphogypsum within the Bevill exclusion because it passes all of the final Bevill mineral processing wastes criteria. The type(s) and magnitude of risk posed by this material, including its radioactive constituents, will be addressed in the forthcoming Report to Congress.

The Agency also wishes to reiterate its position regarding the definition of phosphogypsum, as articulated in the April NPRM. Phosphogypsum and the process water that is used to remove it to disposal represent two separate waste streams that could, if the industry desired, be managed separately. The Agency understands that when the phosphogypsum waste stream leaves the mineral processing circuit it is not entrained in the process water, but is a semi-solid residue from a filtering operation. The solid waste is *then* entrained in the process water in order to transport the waste to gypsum stacks for disposal. While alternative transport systems may be impractical, the fact remains that there exist two waste streams capable of being managed separately which must be considered separately for this rulemaking. Therefore, only phosphogypsum will be unconditionally retained within the Bevill exclusion for today's ruling.

EPA will address the status of process wastewater from phosphoric acid production, including its components (i.e., the gypsum stack run-off issue) in the September, 1989 proposal.

5. Slag From Elemental Phosphorus Production

Commenters supported EPA's proposal to retain slag from elemental phosphorus production within the Bevill Amendment. They claimed that phosphorus industry materials streams are generated by "mineral processing" operations as defined by the EPA, are high volume wastes, and are not high hazard wastes.

6. Furnace Scrubber Blowdown From Elemental Phosphorus Production

Some commenters supported EPA's proposal to retain furnace scrubber blowdown from elemental phosphorus production within the Bevill Amendment. They claimed that phosphorus industry materials streams are generated by "mineral processing" operations as defined by the EPA, are high volume wastes, and are not high hazard wastes.

Other commenters objected to including furnace scrubber blowdown within the Bevill exclusion. They contended that furnace scrubber blowdown from phosphorus production cannot be considered low hazard under any reasonable definition. Of the two plants sampled in a study contracted by EPA, both plants yielded samples that exceeded 100 times the MCLs for alpha particle radioactivity, radium-226, or both. One plant exceeded the EP standard for cadmium, while the other exceeded the MCL for arsenic by more than 10-fold, and exceeded the 10–5 cancer risk level by almost 850 fold.

7. Acid Plant and Scrubber Blowdown from Primary Copper Processing

Several commenters argued that acid plant blowdown and Lurgi scrubber effluent should be retained in the Bevill exclusion because they meet both the high volume and, at least at some facilities, the low hazard criteria. One commenter asserted that acid plant and scrubber blowdown from primary copper processing should not be eliminated from the Bevill Amendment based on its failure of EPA's low hazard test. They stated that the Agency should consider the burden of compliance for sectors eliminated from the Bevill exclusion. The commenter that claimed to have a low hazard waste stated that: (1) Their alkaline tailings are mixed with the waste which neutralizes the blowdown/Lurgi mixture, and (2) metals in the waste, by operation of internal chemical processes, become tightly bound in the matrices of various complex hydroxides contained in the tailings in which they are mixed, thus producing a minimal risk of leaching. Therefore, the representative samples of the Lurgi/blowdown/tailings mixture are not EP toxic. Additionally, they contended that the mixture poses no threat of release into the environment because the waste is deposited in a tailings pond on a deep tailings base which serves as an effective seal from migration into soil or groundwater, the waste is deposited a great distance from drinking water, and the commenter's facilities are located in an arid, unpopulated region.

Other commenters agreed with EPA's proposal to remove acid plant and scrubber blowdown from primary copper processing from the Bevill exclusion, arguing that blowdown from primary copper processing cannot be considered low hazard under any reasonable definition. They noted that the waste sampling effort conducted for the draft Report to Congress revealed that all samples of copper acid plant blowdown exhibited the EP toxicity characteristic. In addition, they indicated that the waste contained elevated leachable levels of arsenic, cadmium, and mercury, and that the acid plant blowdown samples exceeded EP characteristic trigger levels; the mercury concentrations exceeded by up to 99.5 times, and the cadmium concentrations exceeded by a factor as high as 24.5. They also noted that water extraction sampling also revealed that the waste contains leachable arsenic and cadmium at concentrations exceeding the EP trigger level. They contended that data from the Draft Report to Congress demonstrate exceedances of the AWQC for copper smelting slag; cadmium exceeds the AWQC by up to 25,000 times, arsenic by up to 1,930 times, and mercury by up to 30,000 times.

8. Acid Plant Blowdown from Primary Lead Processing

One commenter contended that acid plant blowdown from primary lead processing should not be eliminated from the Bevill Amendment based on its failure of EPA's low hazard test. The commenter maintained that lead processing acid plant blowdown and scrubber blowdown fall within the definition of process wastewaters and meet the high volume criterion; therefore, the waste should be studied.

9. Air Pollution Control Scrubber Blowdown from Primary Tin Processing

The single tin processor in the U.S. submitted in response to the October NPRM that it generated on average 68,000 metric tons of blowdown, which they claimed is a relatively dilute stream in the neutral pH range, and is similar to smelters in the lead and copper smelters. No comments were received in response to the April NPRM.

EPA need not address in detail the comments on the hazard status of phosphorous furnace scrubber blowdown and acid plant blowdown from copper, lead, and tin. These liquid wastes all fail the volume criterion.

III. Final Criteria for Defining Bevill Mineral Processing Wastes

A. Definition of Mineral Processing Wastes

For purposes of this rule, mineral processing wastes are generated by operations downstream of beneficiation (as codified by today's rule) and originate from a mineral processing operation as defined by the following elements:

(1) Excluded Bevill wastes must be solid wastes as defined by EPA.

(2) Excluded solid wastes must be uniquely associated with mineral industry operations.

(3) Excluded solid wastes must originate from mineral processing operations that possess all of the following attributes:

a. Follow beneficiation of an ore or mineral (if applicable);

b. Serve to remove the desired product from an ore or mineral, or from a beneficiated ore or mineral, or enhance the characteristics of ores or minerals, or beneficiated ores or minerals;

c. Use mineral-value feedstocks that are comprised of less than 50 percent scrap materials;

d. Produce either a final mineral product or an intermediate to the final product; and

e. Do not combine the product with another material that is not an ore or mineral, or beneficiated ore or mineral (e.g., alloying), do not involve fabrication or other manufacturing activities, and do not involve further processing of a marketable product of mineral processing.

(4) Residuals from treatment of excluded mineral processing wastes must be historically or presently generated and must meet the high volume and low hazard criteria in order to retain excluded status.

Beneficiation operations include crushing, grinding, washing, dissolution, crystallization, filtration, sorting, sizing, drying, sintering, pelletizing, briquetting, calcining, roasting in preparation for leaching (to produce a final or intermediate product that does not undergo further beneficiation or processing), gravity concentration, magnetic separation, electrostatic separation, flotation, ion exchange, solvent extraction, electrowinning, precipitation, amalgamation, and heap, dump, vat, tank, and *in situ* leaching.

Processing operations generally follow beneficiation and include techniques that often destroy the ore or mineral, such as smelting, electrolytic refining, and acid attack or digestion. EPA also wishes to emphasize that operations following the initial "processing" step in the production sequence are also considered processing operations, irrespective of whether they involve only the techniques defined above as beneficiation. Therefore, solid wastes arising from such operations are considered mineral processing wastes, rather than beneficiation wastes.

B. The High Volume Criterion

High volume mineral processing wastes are defined as (1) non-liquid mineral processing wastes that were generated at an average annual rate of greater than 45,000 metric tons per year per facility, and (2) liquid mineral processing wastes that were generated at an average annual rate of more than 1,000,000 metric tons per year per facility during any year between 1983 and 1988.

For the purposes of this rulemaking, the volume criterion for non-liquids has been and will be used to determine if both solid (e.g., slag, phosphogypsum) and semi-solid (e.g., waste treatment sludge) materials are high volume. The volume criterion for liquids has been used to determine whether wastewaters and other aqueous wastes are high volume. Professional judgment will be employed in deciding which criterion to apply to a particular waste stream. The Agency considered the possibility of using a quantitative measure, such as percent solids, to distinguish between liquid and non-liquid materials, but concluded that such an approach would lead to results that are inconsistent with the purpose of employing separate criteria for defining large volume liquid and large volume non-liquid wastes. Specifically, the solids content of some liquid wastes generated by mineral processing operations may be higher than the solids content of some sludges resulting from the treatment of other mineral processing wastes, in spite of the fact that a major volume reduction operation (such as settling) has yet to be performed on the untreated liquid waste. Therefore, use of quantitative criteria might result in inappropriately considering a waste that has a solids content above the cut-off but for which additional volume reduction is likely (such as may occur as a result of treatment and discharge of wastewater), to be large volume, or vice versa.

The final volumetric cut-offs presented here reflect some of the largest quantities of individual and identifiable waste streams managed at facilities that are currently in the Subtitle C regulatory system. EPA developed the information supporting these cut-offs in direct response to comments reflecting both sides of this issue criticizing the Agency's less complete justification of the volume criterion cut-off values contained in the October and April proposals. For each facility responding to EPA's TSDR Survey (discussed above), the Agency first determined whether they operated an on-site hazardous waste landfill or on-site hazardous wastewater management units (wastewater treatment systems, treatment tanks, surface impoundments, or underground injection wells). Data pertaining to landfill disposal were used to develop the criterion for non-liquids and data regarding wastewater management units were used to derive the criterion for liquids. Because mineral processing wastes are typically inorganic, any solid/sludge materials that are solid wastes and are not recycled and might be regulated under subtitle C would have to be disposed in a subtitle C landfill. Therefore, establishing a volume criterion for these materials requires analysis of hazardous waste disposal in subtitle C landfills. Similarly, because liquid mineral processing wastes are generally aqueous and thus may be managed using one or more of several different techniques, EPA analyzed all of the significant technologies employed to manage hazardous wastewater under subtitle C. In both cases, the Agency identified the largest individual waste stream managed by an appropriate technique at each facility (i.e., one hazardous waste stream per facility), then computed univariate statistics on the resulting distribution. (This is the same basic approach used by certain commenters who proposed volume cut-offs utilizing data from EPA's 1985 Biennial Survey.) The final volumetric criteria represent approximately the largest individual waste stream managed by the facility at the 95th percentile of the relevant distribution. Relevant data are presented in Table 1. The Agency believes that the 95th percentile of the largest individual waste stream managed at each facility both provides a meaningful measure of the amenability of subtitle C controls to different waste types, and represents a reasonable overlap between Subtitle C wastes and Bevill wastes. EPA also notes that this value is a compromise between commenters that favored using the 99th percentile and those that favored the 90th percentile.

TABLE 1.[1]—UNIVARIATE STATISTICS ON SOLID AND LIQUID HAZARDOUS WASTES

[All quantities in metric tons managed in 1986]

	Solids	Wastewaters
Percentile:		
100	194,319	44,307,857
99	77,443 or 194,319 [2]	4,589,261 or 4,999,573
95	41,540 or 46,192	1,098,412 or 1,112,680
90	31,505 or 31,746	348,230 or 350,224
75	10,072 or 10,815	49,030 or 49,105
Number of facilities	98	964

[1] For a detailed discussion of the derivation of these data, see the docket for this rulemaking.

[2] The two different numbers reflect results using two different and equally valid techniques for computing univariate statistics. Large differences indicate significant uncertainty with respect to that portion of the distribution.

The Agency believes that by developing the final volume criterion in this manner, it has resolved all of the significant issues raised in public comment on the high volume criterion presented in the two proposed rules. First, the basis of comparison (recent Subtitle C waste management) is the most relevant to addressing the question at hand (amenability to Subtitle C controls). Second, the way in which the comparison was developed is more internally consistent than in the previous analysis; EPA developed a criterion from data on hazardous waste management of individual waste streams and will apply this criterion to individual mineral processing waste streams. Third, the two separate criteria that are presented here reflect the highly significant differences in treatment processes and treatment residuals management options that exist between nonliquid and liquid wastes. As stated in the April NPRM, it is more technically feasible to manage large volumes of wastewater than it is to manage large volumes of solids, because wastewater treatment effluent (by far the largest treatment residue in most cases) can typically be discharged or recycled while solids must often be land-disposed. Finally, in developing this approach, EPA has reconsidered its earlier position and included commercial hazardous waste management facilities in the database used to develop the cut-offs for the final high volume criterion, because the issue at hand is technical feasibility of Subtitle C waste management; considerations of differential economic incentives facing operators of commercial and private hazardous waste management facilities are not relevant in resolving this issue. Therefore, the Agency selected a volume criterion of 45,000 metric tons per year per facility for non-liquid mineral processing wastes and 1,000,000 metric tons per year per facility for liquid mineral processing wastes to correspond to approximately the 95th percentile (and rounded off so that the criterion could be easily expressed; the rounding had no effect on any waste stream's status).

C. The Low Hazard Criterion

1. The Toxicity and Mobility Test

A high volume mineral processing waste is not low hazard and, therefore, is not eligible for the temporary exclusion from Subtitle C requirements provided by the Bevill Amendment if:

- Available data indicate that waste extracts obtained using EPA Method 1312 and analyzed using established SW-846 methods contain concentrations of arsenic, barium, cadmium, chromium, lead, mercury, selenium or silver that exceed 100 times the MCL for the constituent at two or more facilities that generate the waste, unless:

i. The waste is generated at five or more facilities; and

ii. Substantial additional relevant data are available and the preponderance of these additional data indicate that the waste should be considered low hazard, where:

a. Relevant data are defined as data that result from analysis of waste extracts obtained by EPA Methods 1310, 1311, and 1312, ASTM Test Method D3987–81, or comparable procedures that the Agency has reason to believe produce reliable and representative data; and

b. To be considered substantial, the additional data must characterize the waste at 3 plants (other than those two plants where Method 1312 results exceed 100 times the MCLs) *or* at least half of the facilities that generate the waste (other than those two plants where Method 1312 results exceed 100 times the MCLs), whichever number of plants is larger.

- Constituent concentrations measured in waste sample extracts obtained using Method 1312 are used to determine facility-level values as follows:

i. If data for only one sample of the waste are available, then these data determine the facility-level constituent concentrations; and

ii. If data on two or more samples are available, then the lower bound of the 80 percent confidence interval of the mean of the data [7] serves as the facility-level constituent concentrations, where the confidence interval is calculated for each waste for each constituent using all results (from all plants generating the waste) available from testing of the waste using Method 1312.

This criterion is more complicated than the low hazard criterion proposed in April in two respects: (1) It requires that the 80 percent confidence interval for the mean be calculated for each constituent and each waste type; and (2) It requires consideration of data other than Method 1312 results, including data based on Method 1310 and 1311 that were provided in public comments or in response to the mineral processing waste survey or the "3007 letter" request for waste characteristics information.

Nonetheless, EPA believes that these modifications are appropriate because they allow EPA to make use of data that the Agency specifically requested that industry provide, while avoiding biases inherent in other alternatives for including these data. Moreover, the revised low hazard criterion is directly responsive to commenters who indicated that it was inappropriate, i.e., inconsistent with the spirit of the Bevill exclusion, for a screening criterion to remove the exclusion from a waste that "fails" the low hazard criterion at two facilities while "passing" the criterion at many more other facilities.

---

[7] The 80 percent confidence interval is recommended (guidance) in chapter 9 on sampling in SW–846 as the confidence interval to be used for evaluating whether wastes pass or fail regulatory thresholds. Because the low hazard criterion is being used as a screening test to remove wastes that are clearly not low hazard from the Bevill exclusion, EPA is comparing the lower bound of the 80 percent confidence interval with the relevant standards.

2. The pH Test

A high volume mineral processing waste is not low hazard and, therefore, is not eligible for the temporary exclusion from Subtitle C requirements provided by the Bevill Amendment if:

- Fewer than five facilities generate the waste and the pH (determined as required by 40 CFR 261.22) is less than one (1) or greater than 13.5 at two or more facilities that generate the waste, or if five or more facilities generate the waste and the pH is less than one (1) or greater than 13.5 at 50 percent or more of the facilities that generate the waste.
- pH values measured for waste samples are used to determine facility-level values for individual candidate low hazard wastes as follows:

i. If a datum for only one sample from a facility is available, this datum determines the facility-level pH; and

ii. If data on two samples from a facility are available, the lower value determines the facility-level pH; and

iii. If data on more than two samples from a facility are available, the median value defines the facility-level pH.

The changes to the pH test from the April NPRM (i.e., the protocol for considering additional data) were made for the same reasons as discussed above with respect to the toxicity and mobility test.

IV. Final Bevill Status of Selected Mineral Processing Wastes

The present status of all candidate Bevill mineral processing wastes that were proposed either for retention within or removal from the exclusion in either the October or April proposals is presented in Table 2.

TABLE 2.—CURRENT STATUS OF PREVIOUSLY PROPOSED CANDIDATE BEVILL MINERAL PROCESSING WASTES

Commodity sector	Waste stream	Status	Reason for Bevill Status
Bauxite	Red and Brown Muds	Retained	Passes all Bevill Criteria.
Beryllium	Barren Filtrate	Removed	Low Volume.
	Bertrandite Thickener Slurry	Subtitle D+ Program	Reclassified as Beneficiation.
	Processing Raffinate	Removed	Low Volume.
Cerium	Process Water	Removed	Low Volume.
Chromite	Roast/Leach Ore Residue	Conditionally Retained	Passes High Volume.
Coal Gas	Cooling Tower Blowdown	Removed	Low Volume.
	Gasifier Ash	Conditionally Retained	Passes High Volume.
	Process Wastewater	Conditionally Retained	Passes High Volume.
Copper	Acid Plant Scrubber Blowdown	Removed	Low Volume.
	Bleed Electrolyte	Removed	Low Volume.
	Calcium Sulfate Sludge from WWT	Conditionally Retained	Passes High Volume.
	Process Wastewater	Removed	Low Volume.
	Slag	Retained	Passes all Criteria.
	Slag Tailings	Conditionally Retained	Passes High Volume.
Elemental Phosphorus	Furnace Off-Gas Solids	Conditionally Retained	Passes High Volume.
	Furnace Scrubber Blowdown	Removed	Low Volume.
	Process Wastewater	Removed	Low Volume.
	Slag	Retained	Passes all Criteria.
Hydrofluoric Acid	Fluorogypsum	Conditionally Retained	Passes High Volume.
	Process Wastewater	Conditionally Retained	Passes High Volume.
Iron	APC Dust/Slurry from Blast Furnaces	Conditionally Retained	Passes High Volume.
	Blast Furnace Slag	Conditionally Retained	Passes High Volume.
Lanthanides	Ammonium Nitrate Process Solution	Removed	Low Volume.
Lead	Acid Plant Blowdown	Removed	Low Volume.
	Process Wastewater	Conditionally Retained	Passes High Volume.
	Slag	Retained	Passes all Criteria.
Lightweight Aggregate	APC Dust/Sludge	Conditionally Retained	Passes High Volume.
	Scrubber Wastewater	Removed	Low Volume.
Magnesium	Wastewater from the Anhydrous Process	Conditionally Retained	Passes High Volume.
Molybdenum	Selenium Pl. Effluent from Processing APB	Removed	Low Volume.
Phosphoric Acid	Phosphogypsum	Retained	Passes all Criteria.
	Process Wastewater	Conditionally Retained	Passes High Volume.
Soda Ash	Wastes from Trona Ore Processing	Subtitle D+ Program	Reclassified as Beneficiation.
Steel	Steel (BOF and OHF) APC Dust/Sludge	Conditionally Retained	Passes High Volume.
	Steel (BOF and OHF) Slag	Conditionally Retained	Passes High Volume.
Tin	Air Pollution Control Scrubber Blowdown	Removed	Low Volume.
Titanium	Chloride Processing Waste Acids	Removed	Low Volume.
	Chloride Processing Waste Solids	Conditionally Retained	Passes High Volume.
	Leach Liquor	Removed	Low Volume.
	Sulfate Processing Waste Acids	Conditionally Retained	Passes High Volume.
	Sulfate Processing Waste Solids	Conditionally Retained	Passes High Volume.
Zinc	Acid Plant Blowdown	Removed	Low Volume.
	Process Wastewater	Removed	Low Volume.
	Zinc-Lean Slag	Conditionally Retained	Passes High Volume.

For today's final rule, EPA has applied the criteria described above to all waste streams for which it has sufficient information to make regulatory decisions. The data supporting these decisions were provided in the October and April proposals. Based upon these data and new sampling and analysis results (Method 1312) which may be found in the docket for today's rule, the following five wastes are retained within the Bevill exclusion:

1. Slag from primary copper smelting;
2. Slag from primary lead smelting;
3. Red and brown muds from primary bauxite refining;
4. Phosphogypsum from phosphoric acid production; and
5. Slag from elemental phosphorus production.

EPA has determined that each of these materials meets the definition of a waste from mineral processing operations, is generated at an annual rate exceeding the relevant final volume criterion (45,000 metric tons per year per facility for nonliquid wastes) and passes the final low hazard criterion (i.e., does not fail the toxicity and mobility or pH tests at two or more facilities).

Twenty wastes are conditionally retained within Bevill because they appear, based upon currently available data, to meet the final high volume criterion; the data needed to implement the low hazard criterion for these wastes, however, is currently unavailable. Most of these wastes were proposed for conditional exclusion in the April proposal. Two wastes (process wastewater from hydrofluoric acid production, and APC dust/slurry from carbon steel (open hearth and basic oxygen furnace) production) have been added because of information received in public comment on the April notice, as interpreted by best professional judgment.

Eighteen specific wastes proposed either for conditional retention or for removal on the basis of hazard, in addition to the list of small volume wastes provided in the April NPRM (see 54 FR 15343–4) (or any other small volume or speculative wastes, whether or not nominated for conditional exclusion), are hereby removed from the Bevill exclusion. All are liquid wastes that are generated in quantities well under the final one million metric ton per year per facility cut-off, based upon available EPA data and data submitted to the Agency in public comment.

Finally, a small number of wastes that EPA either proposed for retention in April or were nominated in public comment on the October or April proposals have been reclassified as beneficiation wastes, and hence will be addressed by the RCRA subtitle D program for mineral extraction and beneficiation wastes that EPA is currently developing. These include, but are not limited to, wastes from trona ore processing and bertrandite thickener slurry from primary beryllium production (both proposed in April), and sulfate leach ore residue from primary copper production (nominated by a commenter on the April NPRM).

V. Schedule for Final Resolution of Bevill Status for All Remaining Candidate Bevill Mineral Processing Wastes

As discussed above, the Bevill status of all potential high volume, low hazard mineral processing wastes will be proposed by EPA by September 15, 1989. Following receipt and analysis of public comments on these proposed exclusion decisions, the Agency will articulate final action on each candidate Bevill waste in a final rule by January 15, 1990. At this time, the universe of Bevill-excluded mineral processing wastes will be established, and no additional wastes will be added.

Today's final rule includes a revised list of conditionally retained wastes (see Table 2, above). Modifications to this list, which was originally published in the April NPRM, have been made to reflect new information received in public comment on the April notice, and professional judgment in applying the final Bevill mineral processing wastes criteria to EPA's data on the specific mineral production operations that generate candidate Bevill wastes and on waste generation rates. Some of the wastes designated today as being conditionally retained wastes may be proposed for removal from the Bevill exclusion in September if the survey and/or waste sampling and analysis data that the Agency is currently collecting indicate that they do not pass both the high volume and low hazard criteria. In no event, however, will additional mineral processing wastes be considered for retention within the Bevill exclusion.

VI. Regulatory Implementation and Effective Dates of the Final Rule

As of the effective date of this final rule, mineral processing wastes that have been temporarily excluded from regulation under subtitle C of RCRA since 1980, except the 25 "special wastes" described above, may now be subject to subtitle C requirements beginning in February 1990 (i.e., six months after this notice appears in the **Federal Register**) in those states that do not have authorization to administer their own hazardous wastes program in lieu of EPA. Generators, transporters, and TSD facilities in authorized states will be subject to RCRA requirements imposed as a result of this rule only after the state revises its program to adopt equivalent requirements and EPA authorizes the revision. The requirements imposed as a result of removing the temporary exclusion include: determining whether the solid waste(s) exhibit hazardous characteristics (40 CFR 262.11); obtaining an EPA identification number for managing hazardous wastes (40 CFR 262.34); complying with recordkeeping and reporting requirements (40 CFR 262.40–262.43); and obtaining interim status and seeking a permit (or modifying interim status, including permit applications or modifying a permit, as appropriate) (40 CFR part 270).

A. Section 3010 Notification

Not later than November 30, 1989, all persons who generate, transport, treat, store, or dispose of wastes removed from temporary exclusion by this rule and which are characteristically hazardous under 40 CFR part 261, subpart C, will be required to notify either EPA or an authorized State of these activities pursuant to section 3010 of RCRA. Notification instructions are set forth in 45 FR 12746, February 26, 1980. Persons who previously have notified EPA or an authorized State of their activities pursuant to section 3010 of RCRA, i.e., persons who previously have notified EPA or an authorized state that they generate, transport, treat, store or dispose of hazardous waste and have received an identification number (see 40 CFR 262.12, 263.11 and 265.1) need not re-notify.[8] Persons without EPA identification numbers are prohibited from generating, transporting, treating, storing, or disposing of hazardous wastes.

The Agency views the section 3010 notification requirements to be necessary in this case because it believes that many persons that manage the wastes coming into subtitle C regulation today have not previously notified EPA and received an EPA identification number.

B. Compliance Dates

1. Interim Status in Unauthorized States

Facilities that currently treat, store, or dispose of the wastes removed from temporary exclusion of this rule, and are characteristically hazardous under 40 CFR part 261, subpart C, but have not received a permit pursuant to section 3005 of RCRA and are not operating pursuant to interim status, may be eligible for interim status under HSWA (see section 3005(e)(1)(A)(ii) of RCRA, as amended). In order to operate pursuant to interim status, such facilities must submit a section 3010 notice pursuant to 40 CFR 270.70(a) by November 30, 1989, and must submit a part A permit application by March 1, 1990. Under section 3005(e)(3), land disposal facilities qualifying for interim status under section 3005(e)(1)(A)(ii) must also submit a part B application and certify that the facility is in compliance with all applicable ground water monitoring and financial responsibility requirements by March 1, 1991. If the facility fails to do so, interim status will terminate on that date.

Completion of final permit application will require individual facilities to develop and compile information on their on-site waste management operations including, but not limited to the following activities: ground-water monitoring (if waste management on land is involved); manifest systems, recordkeeping, and reporting; closure, and possibly, post-closure requirements; and financial responsibility requirements. The permit applications may also require development of engineering plans to upgrade existing facilities. In addition, many of these facilities will, in the future, be subject to land disposal restrictions (LDR) standards. EPA plans to promulgate LDR standards for all characteristic hazardous wastes by May 8, 1990. Under EPA regulations, these standards must require treatment of the affected wastes to a level or by a method that reflects the use of Best Demonstrated Available Technology (BDAT) before the wastes can be disposed on the land. Thus, one future implication of today's final rule will be the ban on land disposal of these wastes unless they are appropriately treated prior to such disposal. (See discussions of the LDR as related to these wastes for further details).

All existing hazardous waste management facilities (as defined in 40 CFR 270.2) that treat, store, or dispose of hazardous wastes covered by today's rule, and that are currently operating pursuant to interim status under section 3005(e) of RCRA, must file with EPA an amended part A permit application by March 1, 1990, in accordance with § 270.72(a).

Under current regulations, a hazardous waste management facility that has received a permit pursuant to section 3005 may not treat, store, or dispose of the wastes removed from temporary exclusion by today's rule and which are characteristically hazardous under 40 CFR part 261, subpart C, when the rule becomes effective on March 1, 1990, until a permit modification allowing such activity has occurred in accordance with § 270.42. EPA has recently amended its permit modification procedures for newly listed or identified wastes. For more details on the permit modification procedures, see 53 FR 37912.

2. Interim Status in Authorized States

Until the State is authorized to regulate the wastes excluded from temporary exclusion by today's rule and which are hazardous under 40 CFR part 261, subpart C, no permit requirements apply and facilities lacking a permit need not seek interim status. Any facility treating, storing, or disposing of these wastes on or before the effective date of authorization of the State to regulate these wastes under RCRA may qualify for interim status under applicable State law. Note that in order to be no less stringent than the Federal program, the State "in existence" date for determining interim status eligibility may not be after the effective date of EPA's authorization of the State to regulate these wastes. These facilities must also provide the required 3010 notification as described above and must also provide the State's equivalent of a part A permit application as required by authorized State law.

Finally, RCRA section 3005(e)(3) or any authorized State analog will apply to land disposal facilities qualifying for State interim status.

VII. Effect on State Authorizations

This final rule is not effective in authorized States, because its requirements are not being imposed pursuant to the Hazardous and Solid Waste Amendments of 1984. Thus, this removal from temporary exclusion is applicable on March 1, 1990, only in those few States that do not have final authorization to operate their own hazardous waste programs in lieu of the Federal program. In authorized States, the reinterpretation of the regulation of non-excluded processing wastes will not be applicable until the State revises its program to adopt equivalent requirements under State law and receives authorization for these new requirements. (Of course, the requirements will be applicable as a State law if the State law is effective prior to authorization).

States that have final authorization are required (40 CFR 271.21(e)) to revise their programs to adopt equivalent standards regulating non-Bevill mineral processing wastes that exhibit hazardous characteristics as hazardous by July 1, 1991, if only regulatory changes are necessary, or by July 1, 1992, if statutory changes are necessary. These deadlines can be extended by up to six months (i.e., until January 1, 1992, and January 1, 1993, respectively) in exceptional cases (40 CFR 271.21(e)(3)). Once EPA approves the revision, the State requirements become RCRA subtitle C RCRA requirements in that State. States are not authorized to carry out any regulations providing coverage similar to today's proposed rule as RCRA requirements until such regulations (or modifications to regulations) are submitted to EPA and approved. Of course, States with existing standards may continue to administer and enforce them as a matter of law.

States that submit an official application for final authorization less than 12 months after the effective date of the reinterpretation may be approved without including an equivalent provision (i.e., to address non-Bevill mineral processing wastes) in the application. However, once authorized, a State must revise its program to include an equivalent provision according to the requirements and deadlines provided at 40 CFR 271.21(e).

VIII. Economic Impact Screening Analysis Pursuant to Executive Order 12291

Sections 2 and 3 of Executive Order 12291 (46 FR 13193) require that a regulatory agency determine whether a new regulation will be "major" and, if so, that a Regulatory Impact Analysis (RIA) be conducted. A major rule is defined as a regulation which is likely to result in:

(1) An annual effect on the economy of $100 million or more;

(2) A major increase in costs or prices for consumers, individuals, industries, Federal, State, and local government agencies, or geographic regions; or

(3) Significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

Section 8 of Executive Order 12291 exempts an agency from the requirements of the order when compliance would conflict with deadlines imposed by statute or judicial order. As noted in the Preamble to the NPRM for this rule last April (54 FR 15345), time constraints imposed by court-ordered deadlines for publication did not allow the Agency to complete a comprehensive preliminary analysis to evaluate potential economic costs and impacts. At that time, the Agency summarized results from previous work and indicated that, although a complete RIA would not be feasible due to time limitations, additional analysis of costs and impacts would be conducted to evaluate whether this should be considered a major rule. This section of today's preamble summarizes EPA's subsequent screening-level economic impact study.

Today's final rule removes the Bevill exclusion from all smaller volume wastes (less than 45,000 metric tons per year for non-liquid wastes and 1,000,000 metric tons per year for liquid wastes) and high volume wastes that are clearly not low hazard (based on currently available data) at ore and mineral processing facilities. Therefore, the impacts of today's rule fall within any metal or non-metal commodity sectors generating such waste streams from mineral processing operations, but only to the extent that these wastes exhibit the characteristic tests for hazardous wastes under subtitle C of RCRA.

---

[8] Under the Solid Waste Disposal Amendments of 1980 (Pub. L. 96–482), EPA was given the option of waiving the notification requirement under section 3010 of RCRA following revision of the section 3001 regulations, at the discretion of the Administrator.

EPA's impact assessment indicates that today's rule is not a major rule (at least according to criterion 1, above), in that preliminary screening-level estimates place the total annual costs of compliance at about $53 million per year. Because this is a screening level analysis, however, the level and distribution of impacts is uncertain. It does appear that a few individual mineral commodity sectors or processing technologies could incur annual costs in the range of one to seven percent of their annual value of shipments (sales). These sectors or technologies, though few in number and small in total value of shipments relative to the 101 commodity sectors reviewed in the study, could be said to incur moderate to substantial impacts. Overall, however, with respect to the mineral industry as a whole or the portion of the industry that performs "mineral processing" in particular, the Agency believes, on the basis of its screening analysis, that today's rule does not constitute a major rule within the context of E.O. 12291.

A. General Approach to Compliance Cost Estimation

The purpose of this analysis was to assess the general level of costs and resultant economic impacts arising from the imposition of current subtitle C requirements on smaller volume mineral processing wastes and high volume wastes that are not low hazard that were previously exempt under the Bevill Amendment. As noted above, a complete and detailed examination of the costs and potential impacts of today's rule was not possible given the Court-ordered schedule prompting this rulemaking. The Agency has, however, undertaken a comprehensive screening-level review of all sectors that could be affected directly by today's rule.

EPA's economic screening methodology consisted of a number of straightforward steps designed to (1) identify and describe all mineral processing sectors, (2) characterize and determine the approximate quantities of relevant waste streams, and (3) estimate the subtitle C compliance costs for all sectors generating potentially hazardous wastes. This section briefly describes the approaches and information sources used to develop these preliminary cost estimates. The following two sections describe the cost estimates and discuss impacts on affected sectors. Additional information concerning the techniques, assumptions, and data sources used in this analysis may be found in a technical background document in the docket for today's rule.[9]

1. Processing Sector Identification

The starting point for the analysis was to identify mineral industry commodity sectors that conduct mineral processing operations within the definition of today's rule. Obviously, facilities in sectors that do not employ such operations will not experience any economic impacts. Working with the U.S. Bureau of Mines, the Agency identified a total of 101 differentiable mineral commodity sectors for initial review. Those specific sectors that employ mineral processing operations were identified by intensive contact with commodity and technical specialists at the U.S. Bureau of Mines, and by consulting outside mineral industry experts particularly knowledgeable of specific industry production techniques and waste management practices. Of the 101 initial sectors, 43 were identified as domestic mineral commodity processing sectors subject to further analysis and review of waste stream characteristics. Of the 58 remaining sectors, 51 commodity sectors were screened out as not conducting processing (i.e., their finished product resulted directly from beneficiation activities). The commodities produced domestically using extraction and beneficiation operations exclusively are listed in appendix A. An additional 7 mineral commodities are not currently processed in the United States. These include arsenic trioxide, cobalt, gallium, graphite, indium, nickel, and thallium.

It is highly noteworthy that the vast majority of mineral commodities listed in appendix A are non-metallic and that only nine of the 43 domestic sectors conducting mineral processing operations produce non-metallic commodities. Thus, the first conclusion that EPA may draw from this screening analysis is that the results from previous cost and impact studies focusing on metallic ore processing sectors are not likely to dramatically underestimate total regulatory compliance costs associated with this rule, as some commenters have persistently claimed.

2. Waste Characterization

The next step was to identify, quantify, and characterize the specific waste streams generated by the 43 identified processing sectors in order to ascertain the extent to which these facilities might be brought into the subtitle C hazardous waste management system. For a few of these sectors, the Agency had past field surveys or sampling data to draw upon, supplemented to some degree by data submitted by commenters in response to previous NPRM's. For the majority of commodity sectors, however, we relied upon technical expertise provided by process engineers experienced in designing and constructing mineral processing facilities and associated waste management systems.

TABLE 3.—MINERAL PROCESSING SECTORS NOT GENERATING POTENTIALLY HAZARDOUS MINERAL PROCESSING WASTES

Antimony [1]
Barite
Bauxite
Beryllium
Boron
Cadmium
Cerium
Cesium/Rubidium
Chromium
Coal Gas
Gemstones
Gold/Silver
Hydrofluoric Acid
Iron
Lightweight Aggregate
Lithium (from ore)
Magnesium (from ore)
Manganese, Ferromanganese
Phosphoric Acid (wet process)
Silicon, Ferrosilicon
Steel
Strontium
Synthetic Rutile
Titanium Dioxide
Zirconium/Hafnium

[1] From pyrometallurgical operations.

For each sector, a brief but systematic review was conducted for the principal or typical processing operation(s), including, for each waste, a waste description, waste generation-to-product ratio estimates, and an assessment of the likelihood of the particular waste exhibiting one or more hazardous waste characteristics. Based upon available information and best professional judgment, 25 of the 43 mineral processing commodity sectors evaluated were found not to generate any solid wastes that are likely to fail characteristic tests for hazard. Because these sectors, which are listed in Table 3, will not suffer economic impacts because of today's final rule, they were not considered further. A total of 18 commodity sectors with 118 facilities were determined likely to generate wastes that may fail hazardous waste characteristic tests. EPA has made every attempt to develop analytical elements (e.g., number of facilities in a given sector) that are directly comparable. Nonetheless, because production data (processes employed, product types, shipment volumes) for some commodities are not available on a plant-specific basis, the number of facilities identified as generating potentially hazardous wastes does not in all cases correspond to the number of facilities producing a given commodity, because very different production processes may be employed within the same commodity sector. Therefore, the number of facilities contributing to a sector's aggregate value of shipments and other sector-wide data may differ from the number of facilities predicted to experience compliance costs. In these cases, EPA may have understated the magnitude of economic impacts. Potentially affected sectors, together with the types and quantities of wastes that might be regulated under subtitle C, are presented in table 4.

---

TABLE 4.—HAZARDOUS WASTE GENERATION BY MINERAL PROCESSING SECTORS

Mineral sector	Process	Hazardous waste type	Facilities generating hazardous waste	Total hazardous waste (MT/year)
Aluminum	Reduction	Casthouse dust	16	13,301
	Reduction	Sludge	13	66,945
	Reduction	Cryolite recovery residue	1	30,000
Antimony	Electrolytic Refining	Stripped anolyte solution solids	1	190
Arsenic	Residuals	Lead dust leachate residue	1	339
Bismuth	Lead dross refining	Metal chloride residues	1	2,937
Calcium Metal	Retorting	Quicklime	1	45
Copper (Non-Electrowinning)	Smelting	Acid plant blowdown	8	4,399,710
	Smelting/Refining	Sodium hydroxide wastewater treatment plant sludge.	1	5,616
	Refining	Bleed electrolyte	8	444,600
	Smelting/Refining	Process wastewater	11	530,500
Copper (Electrowinning)	Electrowinning slime reduction	Residuals	10	5,400
Elemental Phosphorus	Electric furnace	Furnace scrubber blowdown	5	153,000
	Separation	Dust	5	6,446
Ferrochromium	Smelting	Slags and residues	8	161,400
Germanium	Separation	Leachate residue	3	6
Lead	Smelting	Acid plant blowdown	3	350,000
	Smelting	Spent furnace brick	4	530
	Smelting	Slag fines	1	10,400
Magnesium	Electrolytic Refining	Smut	2	21,706
Mercury	McDermitt facility	Furnace calcines	1	11
		Particulate control effluent	1	1,809
		SO_2 scrubber effluent	1	2,792
Mercury	Byproduct of gold	Dust	9	9
		Furnace residue	3	79
Molybdic Oxide/Rhenium	Roasting	Gas cleaning effluent solids	2	64
	Roasting	Refining wastes	2	2,335
	Ion Exchange	Rhenium raffinate	2	68,440
Phosphoric Acid	Furnace	Dust slurry	17	7,394
	Furnace	Phosphate contaminted wastewater	17	6,470
Tantalum/Columbium	Digestion	Digestor sludge	6	3,707
	Digestion	Raffinate solids	6	7,413
Tin	Smelting	APC scrubber blowdown	1	56,000
Titanium Metal	Sponge	Waste chloride	3	36,464
Zinc	Smelting/Refining	Process wastewater	2	1,451,000
	Smelting/Refining	Acid plant blowdown	3	305,800
	Smelting	Synthetic gypsum	1	16,600
	Smelting/Refining	Wastewater treatment plant sludge	5	45,230
	Electrowinning	Non-saleable residues	2	13,600
Total				8,280,200

3. Compliance Cost Estimation Methods

For this analysis, EPA developed likely waste management scenarios for typical facilities in each sector, addressing both current (baseline) processing waste management practices and waste management options under current subtitle C requirements. Typical practices (at appropriate scales of application) for both baseline and subtitle C compliance scenarios include techniques such as wastewater treatment in tanks, management/disposal in waste piles or landfills, and shipment for disposal at commercial off-site landfills or treatment facilities. These management scenarios were then implemented through the use of cost engineering functions to compute the incremental compliance costs of today's rule.

The baseline management scenario was developed using knowledge of current practices. The subtitle C compliance scenario was developed based upon existing statutory and regulatory requirements, and assumptions regarding the types of engineering practices that would be employed to manage individual, newly hazardous wastes under subtitle C. Rather than applying uniform subtitle C assumptions relating to on-site or off-site disposal or assuming that one particular waste disposal practice would be adopted exclusively for all sectors, the Agency designed a tailor-made subtitle C compliance scenario for each waste stream and sector. That is, each waste in each sector was assigned to a sequence of individual waste management techniques appropriate to the physical and chemical characteristics of the material in question, in such a way as to simulate a minimum cost management practice sequence for that waste type and quantity. In cases where two or more technical options existed for managing a particular waste type, EPA selected the least-cost option for managing a given waste quantity.

For each newly hazardous waste stream, an affected facility would be faced with the choice of constructing subtitle C management units or sending the material off-site for disposal. This decision is influenced by economies of scale; for most types of waste management practices, EPA determined that generators of small quantities would pay for off-site disposal, but generators of larger quantities would construct on-site management units. The waste quantity break points and the data that underlie them are presented in the technical background document for this analysis.

For all potentially hazardous mineral processing wastes in a given sector, EPA calculated baseline and projected subtitle C management costs, at the plant or facility level, for a "model plant" of average commodity processing and waste generating capacity. Results were then extrapolated to develop commodity sector totals, and then further aggregated to 4-digit Standard Industrial Classification (SIC) industry-wide totals and U.S. nationwide totals. Annual compliance costs represent the sum of annualized charges for capital investments, operating and maintenance expenses, and costs for on-site closure and postclosure responsibilities, where appropriate.

Because this is a screening-level analysis of a very large number of industrial sectors that was conducted during a short period of time, the results of the analysis must be considered somewhat uncertain. While EPA has attempted to obtain complete coverage of all domestic mineral processing activity, the depth of information that the Agency has been able to develop is variable. EPA is confident that it has identified the major processing operations and the major solid wastes associated with them for each commodity sector. The possibility exists, however, that additional waste streams generated by these processing operations may exist and may require management under subtitle C of RCRA. To the extent that this is true, EPA has underestimated the compliance costs of today's rule.

It is important to note, however, that in many respects, EPA used conservative assumptions in conducting this analysis. For example, for many sectors, the Agency used general engineering or geologic information about the nature and composition of various waste streams to infer whether they would be hazardous, and, if in doubt, adopted the conservative assumption that they would be hazardous. Furthermore, wastes assumed to be or that tested hazardous at one facility were assumed to be hazardous at every facility in that sector using the same or similar processes. EPA also assumed that all affected facilities would be encountering subtitle C requirements for the first time and would therefore not be able to take advantage of scale economies through comanagement of hazardous wastes from other operations (e.g., in addition to mineral processing they may conduct regulated activities that are not covered by Bevill, such as chemical manufacturing).

B. Aggregate and Sector Compliance Costs

EPA's estimate of the total annual cost impact of today's rule is $52.8 million annually. Predicted sector-wide costs span three orders of magnitude across the various affected commodity sectors. Aggregate and sector-specific cost estimates are presented in table 5.

TABLE 5. SUMMARY OF COSTS IN AFFECTED SECTORS WITH HAZARDOUS PROCESSING WASTES

SIC and sector	Aggregate sector costs ($)	Number of affected facilities	Cost per affected facility ($)	Cost/metric ton of mineral ($/mt) (sector-wide)	Costs/value of shipments (%) (sector-wide)
Minerals:					
2819—Phosphorus, elemental	3,111,000	5	622,200	9.65	0.57
2874—Phosphoric acid (furnace grade)	997,000	17	58,647	1.06	0.17
3313—Ferrochromium	4,711,000	8	588,875	44.02	4.67
3331—Copper—excluding Electrowinning	26,170,000	11	2,379,091	27.04	1.32
3331—Copper—Electrowinning	308,000	10	30,800	2.47	0.12
3332—Lead, including bismuth	2,943,000	4	735,750	7.86	1.09
3333—Zinc	7,620,000	5	1,524,000	28.83	2.70
3334—Aluminum	3,107,000	16	194,188	0.91	0.05
3339—Antimony	11,000	1	11,000	0.61	0.02

3339—Germanium	0	3	0	0.00	0.00
Total—All affected mineral sectors	52,845,000	[1] 103	513,056	7.91	0.46
Distribution by four-digit SICs:					
2819—Industrial inorganic chemicals, NEC	3,111,000	5	622,200	9.65	0.57
2874—Phosphatic fertilizers	997,000	17	58,647	1.06	0.17
3313—Electro-metallurgical products	4,711,000	8	588,875	44.02	4.67
3331—Primary copper	26,478,000	[1] 16	1,654,875	27.04	1.32
3332—Primary lead	2,943,000	4	735,750	7.86	1.09
3333—Primary zinc	7,620,000	5	1,524,000	28.83	2.70
3334—Primary aluminum	3,107,000	16	194,188	0.91	0.05
3339—Primary nonferrous metals, NEC	3,878,000	32	121,188	22.39	0.38

[1] Five electrowinning facilities engage also in non-electrowinning refining processes.

Note: All averages are weighted averages.

These data indicate that nearly half of the total compliance costs will be borne by the primary copper sector, and that affected facilities (16 in total) in the copper and zinc sectors will experience annual compliance costs in excess of $1 million per facility. In total, 36 of the 103 potentially affected facilities (35 percent) are predicted to experience annual compliance costs of more than $500,000 per facility.

On the other hand, six commodity sectors will face compliance costs of less than $50,000 per affected facility, and almost one-half (50 of 103) of the facilities generating potentially hazardous wastes removed from the Bevill exclusion by today's rule will experience, on average, incremental subtitle C costs of less than $100,000.

C. Economic Impacts

EPA's screening-level analysis of economic impact compares the magnitude of average compliance costs for each sector to the estimated value of shipments in those sectors. This ratio provides a first approximation of the extent to which the profitability of firms, or, alternatively, commodity prices, may be adversely affected by the imposition of regulatory compliance costs. In this screening analysis, the Agency grouped commodity sectors into three groups according to the value of compliance costs to value of shipments: Those with ratios below one percent, those between one and five percent, and those with ratios greater than five percent. Results are displayed in Table 6.

TABLE 6. CATEGORIZATION OF MINERAL SECTORS, BY LEVEL OF COMPLIANCE COSTS

Cost category mineral	SIC	Costs/value of shipments (%) (sector-wide)	Number of affected facilities
I. Below 1.0 percent:			
Germanium	3339	0.00	3
Mercury (by-product of gold)	3339	0.01	9
Antimony	3339	0.02	1
Calcium metal	3339	0.04	1
Aluminum	3334	0.05	16
Magnesium	3339	0.06	2
Copper—electrowinning	3331	0.12	10
Phosphoric acid (furnace grade)	2874	0.17	17
Tantalum/Columbium	3339	0.29	8
Titanium sponge metal	3339	0.42	3
Phosphorus, elemental	2819	0.57	5
Molybdic oxide and rhenium	3339	0.86	2
Total in category			77
II. 1.0–4.9 percent:			
Lead, including bismuth	3332	1.09	4
Copper—excluding electrowinning	3331	1.32	11
Tin	3339	2.45	1
Mercury (excluding gold by-production)	3339	2.61	1
Zinc	3333	2.70	5
Ferrochromium	3313	4.67	8
Total in category			30
III. 5.0 percent or above:			
Arsenic acid	3339	7.05	1
Total in category			1

NOTE: 5 copper electrowinning facilities also engage in non-electrowinning processes.

1. Impacts on Commodity Sectors

Twelve mineral sectors comprising 76 percent of the potentially affected facilities will incur compliance costs of less than one percent of their annual value of shipments. These are the germanium, by-product mercury, antimony, calcium metal, aluminum, magnesium, copper from electrowinning, tantalum/columbium, furnace process phosphoric acid, titanium sponge, elemental phosphorus, and molybdic oxide/rhenium sectors. Of these, only the molybdic oxide/rhenium commodity sector, with two potentially affected facilities, approaches EPA's one percent cut-off value for identifying moderate economic impacts.

Seven mineral commodity sectors, with a combined total of 31 facilities, will have compliance costs between one and seven percent of their value of shipments. These include lead/bismuth, copper from processes other than electrowinning, tin, primary mercury, zinc, ferrochromium, and arsenic acid. Only the ferrochromium sector, with eight facilities, and the arsenic acid sector, with one facility, have predicted impacts in excess of three percent of their respective value of shipments.

Sectors with ratios above one percent were considered vulnerable to moderate to significant financial impacts and were evaluated in more detail in terms of market and industry factors that might affect the ultimate incidence and impact of the costs.

To place the results into perspective, EPA examined a number of factors such as absolute price levels, major end users of the mineral commodity, competition from imports and substitutes, secondary production, and flexibility in other production cost factors.

- *Lead/Bismuth.* (Average cost/sales of 1.1 percent.) Major uses of lead are in automotive batteries, construction materials, and a wide range of other products. Secondary recovery of lead from used automotive batteries provides a substantial portion of supplies. While marginal substitution is possible in each of the markets, a price increase of 1.4 percent would not substantially alter the basic use patterns of lead. Bismuth is used in a range of pharmaceuticals and chemicals, as well as in manufacturing machine parts. These applications offer a somewhat stable market for bismuth. However, most domestic consumption comes from imports, limiting the potential for domestic suppliers to raise prices.

- *Copper.* (Average cost/sales of 1.3 percent.) Copper is widely used in building construction, electrical and electronic products, industrial machinery and equipment, transportation, and consumer products. The ability of affected firms to raise prices is limited by significant competition from foreign suppliers (some of which are government-supported) and by the wide variety of product substitutes that are available for many copper end uses (e.g., optical fiber in telecommunications cable, plastics in water pipe and plumbing fixtures).
- *Tin.* (Cost/sales of 2.4 percent.) This metal is widely used in coatings, particularly for cans, and alloys in electrical and construction applications. In the coatings business, aluminum, glass, paper, and plastic provide strong competition. Other metals compete in alloy applications. Secondary recovery of tin from scrap is another factor adding to competition. A price increase of 2.4 percent could have a marginal impact on domestic primary tin sales, but may have a significant impact on the one remaining domestic primary tin producer.
- *Mercury.* (Cost/sales of 2.6 percent.) Mercury is used in a number of electrical and chemical applications. Competition is found in the form of different technologies for batteries, process alternatives for electrolytic production of chlorine and caustic soda, substantial supplies of imported mercury, and competition from domestic producers extracting mercury from precious metals side-streams (electrowinning slimes). It is unclear that this facility, which accounts for about 14 percent of domestic production, could recover its compliance costs by increasing prices by 2.6 percent.
- *Zinc.* (Average cost/sales of 2.7 percent.) Zinc is used in die castings and anti-corrosive coatings. In castings, zinc competes with aluminum, plastic, and magnesium. In coatings, plastics, paints, and other alloys offer substitutes. A major competitive factor is the large share of supply (greater than half) coming from imported slab zinc. These factors would limit the ability of domestic sources of zinc to raise prices.
- *Ferrochromium.* (Average cost/sales of 4.7 percent.) Ferrochromium is used in specialty and high-performance alloys and steels. Its performance characteristics render it valuable to existing users and would mitigate the effects of a price increase of 4.7 percent. Nonetheless, imported supplies of ferrochromium may limit the ability of domestic sources to raise prices.
- *Arsenic Acid.* (Cost/sales of 7.0 percent.) The plant producing arsenic acid from residual lead dust is unlikely to be able to recover compliance costs by raising prices. Arsenic-based wood preservatives and pesticides are valuable to end-users. However, arsenic acid produced from imported arsenious trioxide and imported arsenic acid account for 99 percent of domestic demand. Therefore, the market price for this product are unlikely to change as a result of production cost increases at this single, small facility.

2. Effects on Consumer Prices

Because most, if not all, of the immediate markets for the affected mineral commodities are as inputs to other manufacturing or industrial activities, and because, as discussed in the previous section, the ability of firms in most affected sectors to pass through compliance costs appears to be limited, EPA believes that, in general, this rule will not create any appreciable changes in consumer prices.

3. Foreign Trade Impacts

Trade is substantial in many of the mineral commodities addressed in this study. Basic import and export data for the sectors that generate potentially hazardous wastes are presented in Tables 7 and 8, respectively. Export markets are generally small for the commodities that EPA has identified as having moderate to significant compliance cost impacts (i.e., cost/value of shipments of one percent or more), and these markets may be adversely affected by the predicted economic impacts of compliance.

TABLE 7. IMPORTS OF MINERALS PRODUCED IN SECTORS GENERATING HAZARDOUS WASTES, 1987

Mineral and categories [1]	Quantity (MT)	Value ($000)
Aluminum—metal	1,245,510	1,852,152
Antimony—metal	9,701	18,171
Arsenic—compounds	1,540	NA
Bismuth—metals and alloys (gross weight)	1,580	8,769
Calcium	352	1,916
Columbium—ore	2,079	6,612
Copper—refined in ingots, etc	469,181	734,725
Ferrochromium—Ferrochromium and ferrochromium-silicon	302,946	155,189
Germanium—unwrought waste and scrap (gross weight)	15	7,987
Lead—base bullion (lead content)	10,827	7,239
Magnesium—metal	10,884	NA
Mercury—metal	636	3,860
Molybdenum—compounds (gross weight)	3,044	13,407
Rhenium—metal, including scrap	3	2,072
Phosphoric acid	NA	NA
Phosphorus, elemental	4,096	6,609
Tantalum—ore	316	5,186
Tin—metal—bars, blocks, pigs, or granulated	41,159	250,699
Titanium—unwrought sponge metal	929	6,321
Zinc—blocks, pigs, and slabs	705,966	581,221

[1] Categories for data on trade do not necessarily correspond to the mineral sectors that involve processing.

TABLE 8.—EXPORTS OF MINERALS PRODUCED IN SECTORS GENERATING HAZARDOUS WASTES, 1987

Mineral and categories [1]	Quantity (MT)	Value ($000)
Aluminum—ingots, slabs, crude	291,163	415,003
Antimony—metals and alloys, crude	795	2,817
Arsenic—compounds	167	NA
Bismuth—metals and alloys	38	641
Calcium—metal	NA	NA
Columbium	NA	NA
Copper—refined copper and semi-manufactured	114,721	427,843
Ferrochromium	4,535	5,736
Germanium	NA	NA
Lead—pigs, bars, cathodes, sheets, etc	10,118	11,946
Magnesium—metal and alloys, scrap, semi-manufactured	44,151	139,672
Mercury	NA	NA
Molybdenum—compounds (molybdenum content)	1,223	11,146
Rhenium	([2])	([2])
Phosphoric acid—type not specified	500,000	85,912
Phosphorus, elemental	20,382	30,796
Tantalum—ore, metal, other forms; powder	270	34,794
Tin—ingots, pigs, bars, etc	1,398	9,458
Titanium—unwrought sponge metal	85	746
Zinc—slabs, pigs, and blocks	1,082	2,114

[1] Categories for data on trade do not necessarily correspond to the mineral sectors that involve processing.

[2] Negligible.

Sources: U.S. Bureau of Mines. Minerals Yearbook 1987 and Mineral Commodities Survey 1989.

Because imports of many of the mineral commodities in question are significant, the ability of domestic producers to raise prices to recover compliance costs, is, as discussed above, quite limited. A direct comparison of processed domestic minerals with imports is difficult because of the presence of imports in the form of both base metals and other assorted compounds and manufactured products. Nonetheless, using the import figures in table 8 as one measure of the scale of imports, the international trade situation facing the firms in the commodity sectors that will experience cost impacts above the one percent level can be summarized as follows:

- Imports account for a relatively low percentage of domestic demand for lead and for moderate shares of copper and mercury;
- Imports exceed processed domestic production in the tin, zinc, and ferrochromium sectors; and
- Trade data for arsenic acid are difficult to quantify; imports of arsenious trioxide (an intermediate in the production of arsenic acid) are substantial.

In view of the above, it is unlikely that the overall trade balance in the domestic minerals industry will be significantly affected by today's rule, though in some sectors regulatory cost impacts may increase already positive net imports.

IX. Regulatory Flexibility Analysis

The Regulatory Flexibility Act (RFA) of 1980 (Pub. L. 96–354), which amends the Administrative Procedures Act, requires Federal regulatory agencies to consider "small entities" throughout the regulatory process. The RFA requires, in section 603, an initial screening analysis to be performed to determine whether a substantial number of small entities will be significantly affected by a regulation. If so, regulatory alternatives that eliminate or mitigate the impacts must be considered.

Section 608 of the Act allows an Agency head to waive or delay completion of the screening analysis in response to an emergency that makes compliance with the requirements of section 603 on a timely basis impracticable. In previous NPRMs to this rule, the Agency indicated that there was insufficient time within the Court-ordered deadline to complete a comprehensive impact screening for small business impacts, but that, based on previous analyses for metallic metals processing and general knowledge of waste characteristics in non-metals processing, it was probable that there would not be significant small business impacts from this rulemaking (54 FR 15347).

The Agency has now completed a comprehensive screening analysis to determine the potential for significant small business impacts, as described below. Based upon this subsequent analysis, the Agency has concluded that today's final rule will not have a significant adverse impact on a substantial number of small mineral processing companies. With very few exceptions, as indicated below, the commodity sectors with moderate to substantial predicted cost/economic impacts contain either few or no small business enterprises.

A. Definition of Affected Small Entities

Today's rule has its primary direct effects on ore and mineral processing facilities that generate wastes that could fail any of the Agency's tests for hazardous waste characteristics. To the best of the Agency's ability within the time constraints of this Court-ordered final rule, the mineral commodity sectors most likely to face subtitle C compliance costs have been identified in section VIII of this preamble, based on EPA's screening study of cost and economic impacts. Eighteen commodity sectors falling within eight 4-digit SIC codes represent the population of affected business firms (see table 6, above).

For purposes of defining "small business" firms, EPA has relied on the standard definitions of the Small Business Administration (SBA) as published at 13 CFR ch. 1, part 121. For the industries in question, SBA employs a basic employment-based definition, with the small business cut-off value for total company employment ranging between 500 and 1,000 employees, depending upon the specific industry in question.

B. Approach and Data Sources

Based upon the results of the economic impact screening analysis described above in section VIII, EPA conducted a comprehensive RFA business ownership screening analysis for those mineral commodity sectors estimated to incur moderate to significant economic impacts associated with today's rule. While it was not possible in the cost analysis to develop compliance cost estimates specific to different sizes of facilities within each affected mineral sector, all potentially affected small businesses were identified individually. Comparative data were then available to evaluate (a) how many small businesses operate in the mineral sectors predicted by the economic impact screening analysis to be significantly affected and (b) what fraction of the overall small business population in the minerals processing-related industry categories (SICs) might be affected by subtitle C requirements pursuant to this rule.

Working largely with U.S. Bureau of Mines mineral commodity specialists and file data, each of the facilities engaged in affected mineral sectors was identified by name and location. If the facility was owned by a separate parent company, that company was identified using either the Directory of Corporate Affiliations [10] or the Trinet Data Base.[11] Thus, for each sector EPA determined the total number of businesses owning facilities. The Agency then determined the number of employees in each business using one of four sources: Standard and Poor's Corporate Records,[12] Ward's Business Directory,[13] the Trinet Data Base, or phone contacts. Employment figures for public companies were determined using Standard and Poor's Corporate Records. Ward's Business Directory provided employee figures for many of the larger private businesses and the Trinet Data Base identified employee numbers for many of the smaller private businesses. For the small number of businesses that did not appear in any of these sources, the Agency contacted the business by phone to obtain employee information. For all but three of the facilities in the 18 affected mineral commodity sectors, the Agency was able to determine the size of the owner company.

EPA obtained the appropriate SIC classification for each affected sector from the Department of Commerce. The Agency then compared the employee estimates to the Small Business Administration's (SBA's) definition of a small business for the sector's SIC code and determined the number of small and large businesses in that sector. SBA defines small businesses as less than 1,000 employees or less than 750 employees for most of the SIC codes.[14] Results of this analysis are displayed in appendix B to today's preamble.

---

[10] National Register Publishing Company, "Directory of Corporate Affiliations" (Wilmette, IL.: 1988).

[11] Trinet Company Database, Trinet Inc. (Parsippany, NJ.: 1988).

[12] Standard and Poor's Corporation, "Standard and Poor's Corporation Records" (New York, New York: 1988).

[13] Information Access Company, "Ward's Business Directory, Volume 1, US Private Companies, Largest Private Plus Selected Public Companies" (Belmont, CA: 1988).

The Agency also classified the number of affected small businesses by SIC code, then compared this to the total number of small businesses in that SIC code, based on SBA estimates of the total number of small businesses in each SIC code. EPA also computed the percentage of the total number of firms within a given 4-digit SIC code accounted for by affected small businesses and affected small and undefined businesses. Appendix C to today's preamble displays the results of this analysis.

C. Results

From the cost analysis, facilities and companies in 18 mineral commodity sectors within eight 4-digit SIC industries would be subjected to regulatory compliance costs by today's rule. The sectors were previously grouped by level of impact in Table 6. Of the 18 sectors evaluated for economic impact, seven sectors-lead/bismuth, copper from operations other than electrowinning, tin, primary mercury, zinc, ferrochromium, and arsenic acid—have potential average compliance costs greater than one percent of value of shipments (sales) and could therefore be considered to face moderate to substantial impacts for affected firms. Lead/bismuth, tin, mercury (in terms of the one affected facility), and arsenic acid have no small business operations. Only zinc (with one small company), ferrochromium (with three small firms), and possibly copper (with one firm of unknown size), therefore represent affected sectors of concern with respect to small business impacts, with a combined total of four or five small business companies. Supporting data for these findings are presented in appendix C to this preamble.

Taken together, the number of small businesses in these two or three sectors represents a very small fraction of the total number of small businesses in the relevant mineral processing industries.

Based upon this screening analysis, the Agency concludes that there will not be a significant adverse impact on a substantial number of small mineral processing companies as a result of this rulemaking.

---

[14] SBA does not distinguish between businesses that employ more than 500 and less than 1,000 persons, i.e., it is not possible to determine how many businesses employ less than 750 people using SBA data. In the case of SIC categories in which 750 employees is the small business cut-off value, EPA used the SBA figures for businesses with less than 1,000 employees. The actual number of small businesses for those SIC categories may therefore be less.

APPENDIX B—COMPANIES IN MINERAL PROCESSING SECTORS AFFECTED BY TODAY'S RULE BY SBA SIZE CATEGORY—Continued

Total—Above SIC categories		1,269	16	3	1.3	1.5

[1] The Small Business Administration (SBA) provided the estimates of the total number of small businesses within each SIC category. SBA does not distinguish between businesses that employ more than 500 and less than 1,000 persons, i.e., it is not possible to determine how many businesses employ less than 750 people using SBA data. In the case of SIC categories in which 750 employees is the small business cut-off value, EPA used the SBA figures for businesses with less than 1,000 employees. The actual number of small businesses for those SIC categories may therefore be less.

For the reasons set out in the preamble, part 261 of title 40 of the Code of Federal Regulations is amended as follows:

PART 261—IDENTIFICATION AND LISTING OF HAZARDOUS WASTES

1. The authority citation for part 261 continues to read as follows:

Authority: (42 U.S.C. 6905, 6912(a), 6921, and 6922).

2. Section 261.3 is amended by revising paragraphs (a)(2) (i) and (iii) to read as follows:

§ 261.3 Definition of hazardous waste.

(a) * * *

(2) * * *

(i) It exhibits any of the characteristics of hazardous waste identified in subpart C except that any mixture of a waste from the extraction, beneficiation, and processing of ores and minerals excluded under § 261.4(b)(7) and any other solid waste exhibiting a characteristic of hazardous waste under subpart C of this part only if it exhibits a characteristic that would not have been exhibited by the excluded waste alone if such mixture had not occurred or if it continues to exhibit any of the characteristics exhibited by the non-excluded wastes prior to mixture. Further, for the purposes of applying the Extraction Procedure Toxicity characteristic to such mixtures, the mixture is also a hazardous waste if it exceeds the maximum concentration for any contaminant listed in table I to § 261.24 that would not have been exceeded by the excluded waste alone if the mixture had not occurred or if it continues to exceed the maximum concentration for any contaminant exceeded by the nonexempt waste prior to mixture.

* * * * *

(iii) It is a mixture of a solid waste and a hazardous waste that is listed in subpart D of this part solely because it exhibits one or more of the characteristics of hazardous waste identified in subpart C, unless the resultant mixture no longer exhibits any characteristic of hazardous waste identified in subpart C of this part or unless the solid waste is excluded from regulation under § 261.4(b)(7) and the resultant mixture no longer exhibits any characteristic of hazardous waste identified in subpart C of this part for which the hazardous waste listed in subpart D of this part was listed.

* * * * *

2. Section 261.4 is amended by revising paragraph (b)(7) to read as follows:

261.4 Exclusions.

* * * * *

(b) * * *

(7) Solid waste from the extraction, beneficiation, and processing of ores and minerals (including coal), including phosphate rock and overburden from the mining of uranium ore. For purposes of this paragraph, beneficiation of ores and minerals is restricted to the following activities: crushing, grinding, washing, dissolution, crystallization, filtration, sorting, sizing, drying, sintering, pelletizing, briquetting, calcining to remove water and/or carbon dioxide, roasting in preparation for leaching (except where the roasting/leaching sequence produces a final or intermediate product that does not undergo further beneficiation or processing), gravity concentration, magnetic separation, electrostatic separation, floatation, ion exchange, solvent extraction, electrowinning,

precipitation, amalgamation, and heap, dump, vat, tank, and *in situ* leaching. For the purposes of this paragraph, solid waste from the processing of ores and minerals includes only:

(i) The following solid wastes from the processing of ores and minerals that are retained within this exclusion:

(A) Slag from primary copper smelting;

(B) Slag from primary lead smelting;

(C) Red and brown muds from bauxite refining;

(D) Phosphogypsum from phosphoric acid production;

(E) Slag from elemental phosphorus production; and

(ii) The following solid wastes from the processing of ores and minerals that are conditionally retained within this exclusion, pending collection and evaluation of additional data:

(A) Roast/leach ore residue from primary chromite production;

(B) Gasifier ash from coal gasification;

(C) Process wastewater from coal gasification;

(D) Slag tailings from primary copper smelting;

(E) Calcium sulfate wastewater treatment plant sludge from primary copper smelting/refining;

(F) Furnace off-gas solids from elemental phosphorus production;

(G)Fluorogypsum from hydrofluoric acid production;

(H) Process wastewater from hydrofluoric acid production;

(I) Air pollution control dust/sludge from iron blast furnaces;

(J) Iron blast furnace slag;

(K) Process wastewater from primary lead production;

(L) Air pollution control dust/sludge from lightweight aggregate production;

(M) Process wastewater from primary magnesium processing by the anhydrous process;

(N) Process wastewater from phosphoric acid production;

(O) Basic oxygen furnace and open hearth furnace slag from carbon steel production;

(P) Basic oxygen furnace and open hearth furnace air pollution control dust/sludge from carbon steel production;

(Q) Sulfate processing waste acids from titanium dioxide production;

(R) Sulfate processing waste solids from titanium dioxide production;

(S) Chloride processing waste solids from titanium tetrachloride production; and

(T) Slag from primary zinc smelting.

Part IV

Department of Labor

Occupational Safety and Health Administration

29 CFR Part 1910

Control of Hazardous Energy Source (Lockout/Tagout); Final Rule

DEPARTMENT OF LABOR

Occupational Safety and Health Administration

29 CFR Part 1910

[Docket No. S-012A]

RIN 1218-AA53

Control of Hazardous Energy Sources (Lockout/Tagout)

AGENCY: Occupational Safety and Health Administration, (OSHA).

ACTION: Final rule.

SUMMARY: The Occupational Safety and Health Administration (OSHA) is issuing a standard detailing safety requirement for the control of hazardous energy as a new § 1910.147. This standard addresses practices and procedures that are necessary to disable machinery or equipment and to prevent the release of potentially hazardous energy while maintenance and servicing activities are being performed. The standard requires that lockout be utilized for equipment which is designed with a lockout capability except when the employer can demonstrate that utilization of tagout provides full employee protection. For equipment which was not designed to be locked out the employer may use tagout. In addition, the standard also supplements and supports the existing lockout related provisions contained elsewhere in the general industry standards by providing that comprehensive and uniform procedures be used for complying with those provisions. This standard applies to general industry employment under 29 CFR part 1910, but does not cover maritime, agriculture, or construction employment. The standard also does not cover oil and gas well drilling; the generation, transmission and distribution of electric power by utilities; and electrical work on electric conductors and equipment. These will be the subjects of separate rulemaking efforts.

The standard contains definitive criteria for establishing an effective program for locking out or tagging out energy isolating devices and requires training for authorized and affected employees. The standard requires the employer to implement the specified procedures, and to utilize effective control measures based on the workplace hazards that are encountered. OSHA expects that this standard will prevent approximately 122 fatalities, 28,400 lost workday injuries and 31,900 non-lost workday injuries a year.

This rule, § 1910.147, is being placed in Subpart J of part 1910. The present § 1910.147 is redesignated as § 1910.150 to allow for the new section.

DATES: This final standard shall become effective October 31, 1989, except for paragraphs (c)(4), (c)(7), and (f)(2), of § 1910.147 which contain information requirements currently under review at OMB. A document announcing the effective date of the recordkeeping portions will be published at a later date in the **Federal Register**.

ADDRESS: In accordance with 28 U.S.C. 2112(a), the Agency designates for receipt of petitions for review of the standard, the Associate Solicitor for Occupational Safety and Health, Office of the Solicitor, Room S-4004, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210.

FOR FURTHER INFORMATION CONTACT: Mr. James F. Foster, Occupational Safety and Health Administration, Room N3649, U.S. Department of Labor, Washington, DC 20210, (202) 523-8148.

SUPPLEMENTARY INFORMATION: For additional copies of this standard contact U.S. Department of Labor, Occupational Safety and Health Administration, Office of Publications, Room N3101, Washington, DC 20210, (202) 523-9667.

I. Background

OSHA's General Industry standards, 29 CFR part 1910, were originally published in the **Federal Register** (36 FR 10466, May 29, 1971) pursuant to Section 6(a) of the Occupational Safety and Health Act of 1970 (the OSH Act) and became effective on August 27, 1971. Before their adoption as OSHA standards, these occupational safety and health standards were either national consensus standards or established Federal standards. Virtually all of the current lockout provisions in part 1910 which are affected by this standard were adopted under the section 6(a) procedure.

At the time of adoption of the original OSHA standards, there was no general, all-encompassing consensus standard or Federal standard for locking out, tagging out, or disabling of machines or equipment to protect employees when maintenance or servicing activities were being performed—a gap that this rulemaking addresses. However, OSHA did adopt various lockout-related provisions of consensus standards which had been developed for specific types of equipment. These provisions are not deleted by this rulemaking. Current lockout-related provisions in the General Industry Standards (29 CFR part 1910) are found in the following sections:

1910.178	Powered Industrial Trucks
1910.179	Overhead and Gantry Cranes
1910.181	Derricks
1910.213	Woodworking Machinery
1910.217	Mechanical Power Presses
1910.218	Forging Machines
1910.522	Welding, Cutting and Brazing
1910.261	Pulp, Paper and Paperboard Mills
1910.262	Textiles
1910.263	Bakery Equipment
1910.265	Sawmills
1910.272	Grain Handling
1910.399	Electrical

Note: See Ex. 13 for a detailed list of lockout provisions in the above standards. For further information involving the use of these provisions, refer to the discussion found in Section VI, Summary and Explanation of the Standard, addressing paragraph (a)(3)(ii).

The present OSHA regulations for locking out or tagging out machines and equipment, where they do exist, are not uniform coverage. Inconsistencies in these regulations exist between different equipment and industries, and between different types of equipment in the same industry. Some provisions in the OSHA standards require equipment to have the capability of being "locked out," without requiring such control to be utilized. OSHA feels that the lack of a general standard, and the incompleteness of the existing provisions, have contributed to the alarming number of injuries and fatalities that have occurred.

Since the inception of its enforcement program, OSHA, for the most part, has had to rely upon the use of the "General Duty Clause" (section 5(a)(1) of the Act) citation to ensure that employers provide safeguarding for their employees from the hazards involving the release of hazardous energy. This approach has met with only limited success, limited primarily upon the need for OSHA to prove, in the event of the contest of a section 5(a)(1) citation, that the hazard was a "recognized" hazard and that the hazard was causing or could cause death or serious physical harm. Because of these difficulties, and because of the need to fill a significant gap in the current coverage of part 1910, OSHA has been working since 1977 to gather sufficient information to enable the Agency to write a comprehensive standard for energy control in general industry.

In 1977, OSHA published a Notice in the **Federal Register** entitled "Machinery and Machine Guarding, Request for Information on Technical Issues and Notice of Public Meetings" (42 FR 1741, January 7, 1977) (Docket S-212). In this Notice, OSHA addressed the issue of lockout or tagout, including the general question of whether lockout should always be required when machinery is not in its normal operating mode, or whether alternative methods for employee protection, such as tagout, should be permitted (42 FR 1807). The purpose of that Notice was to generate information for use in updating the OSHA machine guarding standards (Subpart 0). Respondents to that Notice generally recognized the hazards to employees when maintenance and repair activities are undertaken, and the need to use lockout or tagout to control these hazards. There was, however, a considerable range of opinion regarding the effectiveness of either a lock, a tag, or a combination of these devices when they are used as safeguards.

The United Automobile, Aerospace and Agricultural Implement Workers of America (UAW) petitioned OSHA on May 17, 1979 (Docket S-012, [Ex. 2-3]) to establish an Emergency Temporary Standard (ETS) for locking out machinery and equipment. The petition stated that there existed a need to recognize the complexities of modern industrial equipment which use sources of energy other than electricity. It contained a discussion of the increasing need for locking out equipment to prevent that equipment from cycling without warning while it was being worked on, and related the importance of applying lockout procedures to systems using hydraulic or pneumatic power, to energy stored in springs and electrical capacitors, and to potential energy from suspended parts. Abstracts of case studies for fatalities involving 22 UAW members which were attributed to lockout-related causes since 1974 were submitted with the petition. OSHA also received other petitions and letters in support of the UAW petition from other labor organizations, including the AFL-CIO, Allied Industrial Workers, and the United Steelworkers of America.

OSHA responded to the UAW petition on September 11, 1979 [Ex. 2], declining to issue an ETS, but advising that OSHA was proceeding to draft an Advance Notice of Proposed Rulemaking (ANPR) addressing the subject, in which the public would be invited to comment on the major issues involved in the development of a standard.

OSHA published the ANPR for a standard on lockout/tagout in the **Federal Register** on June 17, 1980 (45 FR 41012) (Docket S-012). In that Notice, OSHA raised issues about whether or not a generic standard should be proposed; if so, what should be the scope and application of this lockout/tagout standard; what constituted the necessary and sufficient energy isolation methods and means; and whether there was a need for written procedures and documented employee training. There was not overwhelming support in the comments submitted to OSHA for a generic standard to cover all facets of the lockout/tagout problem. The comments did indicate, however, that a performance-oriented standard, offering enough flexibility to take current work practices into consideration, was desirable, and that requirements for documented procedures and employee training would have many advantages. The comments pertaining to securing energy isolating devices (the use of locks or tags) did not generate an overwhelming response strongly favoring either method. The comments received in response to that Notice were utilized in the development of the proposed standard published in the **Federal Register** on April 29, 1988 (53 FR 15496).

There were several other inputs into the development of the Proposed Rule: First, the National Institute for Occupational Safety and Health (NIOSH) provided considerable data to OSHA on this subject. NIOSH published a notice in the **Federal Register** entitled "Lockout and Interlock Systems and Devices: Request for Information" (45 FR 7006, January 31, 1980) (Docket S-012, [Ex. 2-1]) and provided OSHA with the responses to that Notice. As part of that project, NIOSH also published its "Guidelines for Controlling Hazardous Energy During Maintenance and Servicing" [Ex. 3-4]. Other important sources of information were a Bureau of Labor Statistics (BLS) Work Injury Report (WIR) survey entitled, "Injuries Related to Servicing Equipment" [Ex. 3-3] and two OSHA-directed studies—"Selected Occupational Fatalities Related to Lockout/Tagout Problems as Found in Reports of OSHA Fatality/Catastrophe Investigations" [Ex. 3-5], and "Occupational Fatalities Related to Fixed Machinery as Found in Reports of OSHA Fatality/Catastrophe Investigations" [Ex. 3-6]. Two further studies conducted by OSHA involved the compilation and analysis of OSHA Form 36 Preliminary Fatality/Catastrophe Event Reports [Ex. 3-7] and a compilation of OSHA section (5)(a)(1) citations [Ex. 3-8].

Of great assistance to OSHA in this undertaking was the publication on March 8, 1982, of the American National Standards Institute (ANSI) national consensus standard for lockout/tagout, ANSI Z244.1-1982, "American National Standard for Personnel Protection—Lockout/Tagout of Energy Sources—Minimum Safety Requirements" [Ex. 3-9]. This standard lists the uniform performance requirements for developing and utilizing a lockout or tagout procedure for the protection of employees from the unexpected energization, start-up of machines or equipment or release of stored energy during repair, maintenance, and associated activities. The consensus standard was utilized by OSHA as the primary basis for development of its proposed standard.

In July 1983, OSHA developed a preproposal draft of a standard for lockout/tagout [Ex. 3-10]. This draft was developed by utilizing all relevant materials available to OSHA at that time. This draft was distributed to associations, companies, unions and individuals which OSHA was able to identify as having an interest in the regulation. There were about 80 comments received in response to this preproposal draft. The commenters were generally in support of the effort to develop a safety standard for lockout or tagout; however, some commenters objected to the inclusion of a requirement for locking out during activities classified as "normal production operations." Comments from some sources favored the use of locks rather than tags to secure energy isolating devices, while others welcomed the more flexible approach of permitting the use of locks or tags. There was also considerable comment regarding the use of an Appendix. Many commenters wanted the information supplied in the Appendix moved into the body of the standard for enforceability. Others, however, wanted the Appendix material completely removed on the grounds that reference to it by the courts in contested cases would essentially make it mandatory.

The proposed standard was published in the **Federal Register** on April 29, 1988 (53 FR 15495). Interested persons were afforded 60 days to submit comments and/or request a hearing.

On August 9, 1988, OSHA published a Notice in the **Federal Register** (53 FR 29920) announcing the scheduling of a public hearing and an extension of the period for the submission of comments. The hearing was scheduled for September 22 and 23 in Washington, DC, and September 27 and 28 in Houston, Texas. The comment period was extended until September 22. On August 30, 1988, OSHA published another Notice in the **Federal Register** (53 FR 33149) changing the dates for the Houston, Texas segment of the hearing from September 27 and 28 to October 12 and 13.

There were 16 parties who participated in the public hearing which was presided over by Administrative Law Judge Jeffrey Tureck. During the later stages of the hearing, at the suggestion of several of the hearing

BEST COPY AVAILABLE

participants Judge Tureck established a post hearing comment period, allowing the submission of additional data and evidence through November 28, 1988, and the submission of final arguments and briefs through December 23, 1988. Based upon subsequent request of several of the hearing participants, the Administrative Law Judge extended the comment period until February 6, 1989. Judge Tureck certified the record of the hearing, including materials received in the post-hearing comment period on May 3, 1989.

The comments concerning the preproposal draft (Docket S–012), the special studies and other information used in the development of the proposal for this standard, the comments received in response to the publication of the proposed standard, the evidence adduced at the public hearing and the materials submitted in the post-hearing comment period, were all utilized in the development of this Final Rule.

II. Hazards

Whenever machines or equipment are utilized in industry, there are hazards not only to the employees who work with the machines or equipment but also to other employees who work or otherwise are in the immediate area. Moreover, when it is necessary to perform maintenance or servicing on machines or equipment, such activities generate additional, unique hazards due to the continued presence of the energy used by the machine or equipment to perform its production function. This energy can emanate directly from a power source or can be stored in the equipment itself.

OSHA believes that failure to control energy adequately accounts for nearly 10 percent of the serious accidents in many industries. The following accidents, taken from the NIOSH report entitled "Guidelines for Controlling Hazardous Energy During Maintenance and Servicing" [Ex. 4], are typical of these hazards and demonstrate the applicability of the pertinent provisions in the final standard.

1. An employee was cleaning the unguarded side of an operating granite saw. The employee was caught in the moving parts of the saw and pulled into a nip point between the saw blade and the idler wheel, resulting in fatal injuries. (Failure to shutdown or turn off the equipment to perform maintenance—1910.147(d)(2).)

2. An employee was removing paper from a waste hogger. The hogger had been shut down, but the conveyor feeding the hogger had not been. The employee climbed onto the machine, fell onto the conveyor, was pulled into the hogger opening, and was fatally crushed. There was no energy control procedure at this operation. (Failure to document and implement an effective energy control procedure—1910.147(c)(4).)

3. Two employees were repairing a press brake. The power had been shut off for 10 minutes. They positioned a metal bar in a notch on the outer flywheel casing so that the flywheel could be turned manually. The flywheel had not completely stopped. The men lost control of the bar, which flew across the workplace and struck and killed another employee who was observing the operation from a ladder. (Failure to control stored energy—1910.147(d)(6).)

4. An employee was partially inside an asphalt mixing machine, changing its paddles. Another employee, while dusting in the control room, accidentally hit a toggle switch which caused the door of the mixer to close, striking the first employee on the head and killing him. Electrical switches to activate the machine were not deenergized and air pressure to move the doors was not shut off. (Failure to isolate equipment from energy sources—1910.147(d)(3).)

5. An employee was setting up a vacuum forming machine for a run of violin cases. He leaned over the press and accidentally activated the starting switch. His head was crushed between an air cylinder and the frame hogger opening, and was fatally crushed. There was no energy control procedure at this operation. (Failure to document and implement an effective energy control procedure—1910.147(c)(4).)

6. A trainee employee was cleaning a flour batch mixer. The employee was reaching into the machine when another worker activated the wrong switch, thereby turning the machine on. The employee cleaning the flour batch mixer suffered fatal crushing injuries to his neck. There was an unwritten company procedure for locking out during all maintenance. The procedure was not followed. (Failure to document and implement an effective energy control procedure—1910.147(c)(4); failure to train employees adequately in lockout/tagout procedures—1910.147(c)(7).)

7. An employee was cleaning scrap from beneath a large shear when a fellow employee hit the control button activating the blade. The blade came down and decapitated the employee cleaning scrap. (Failure to isolate, lockout/tagout or otherwise disable all potential hazardous energy sources before attempting any repair, maintenance or servicing—1910.147(c)(2).)

Servicing and maintenance activities are necessary adjuncts to the industrial process. They are needed to maintain the ability of all machines, equipment or processes to perform their intended functions. Additionally, erection, installation, construction, set-up, changeover, and dismantling usually must be performed with the equipment deenergized. These types of operations can present the employee with the same types of hazards of unexpected activation, reenergization, or release of stored energy, therefore, they are addressed by this standard. Similarly, lubricating, cleaning, unjamming, and making minor adjustments and simple tool changes are activities which often take place during normal production operations, but which may expose employees to the unexpected activation of the equipment or to the unexpected release of the energy stored in the equipment. All of the above activities are considered to be "servicing and/or maintenance" for the purposes of this standard.

With regard to servicing and/or maintenance which takes place during "normal production operations," it is important to note that this standard is intended to work together with the existing machine guarding provisions of Subpart O of part 1910, primarily §§ 1910.212 (general machine guarding) and 1910.219 (guarding of power transmission apparatus). When a machine is being used for production, § 1910.212 requires that the point of operation be guarded. For example, when an employee is using a table saw to cut wooden parts, the employee would be protected by guards around the blade of the saw. If the employee needs to reach into the point of operation in order to adjust the work piece as part of the production process, § 1910.212 requires that the guarding protection be maintained. As long as guarding is not removed or bypassed, the lockout/tagout standard is not intended to apply to these types of situations. By contrast, using the same table saw, it may be necessary for the employee to remove a piece of wood which has become jammed against the blade of the saw. In doing so, the employee might need to bypass or remove the guard on the saw and reach into the point of operation. Although this action takes place "during" normal production operations, it is not actually production, but is servicing of the equipment to perform its production function. When such servicing may expose the employee to the unexpected activation of the machinery or equipment, or to the release of stored energy, this Final Rule will apply. If the servicing is performed in a way which

prevents such exposure, such as by the use of special tools and/or alternative procedures which keep the employee's body out of the areas of potential contact with machine components or which otherwise maintain effective guarding, this standard will not apply. Thus, lockout or tagout is not required by this standard if the employer can demonstrate that the alternative means enables the servicing employee to clean or unjam or otherwise service the machine without being exposed to unexpected energization or activation of the equipment or release of stored energy.

The above mentioned servicing and/or maintenance activities are currently being accomplished in general industry with varying degrees of safeguarding or protection for employees. This safeguarding or protection ranges from allowing the employee to conduct the servicing or maintenance activity which the machine or equipment is energized and operating (virtually no protection), to requiring that the machine or equipment simply be turned off or shut down, to providing for deenergization and lockout or tagout of the machine or equipment. OSHA believes that the least desirable situation is to allow employees to perform maintenance, repair, or service activities while the machine or equipment is energized and capable of performing its normal production function. The Agency recognizes that there are certain servicing operations which, by their very nature, must take place without deenergization, such as operational testing of machines or equipment. Locking out or tagging out cannot be performed during these operations, since both lockout and tagout require that equipment to be deenergized. Additionally, this standard does not apply when certain tasks are conducted during normal production operations such as repetitive minor adjustments or simple tool changes when these activities do not increase the risk of injury to employees. Conversely, operations such as cleaning and unjamming machines or equipment are covered by this standard when the employee is exposed to greater or different hazards than those encountered during normal production operations; it should be emphasized that this rule applies to cleaning and unjamming when an unexpected activation or release of energy could occur.

The vast majority of servicing or maintenance activities can safely be done only when the machine or equipment is not operating and is deenergized; therefore, these activities are covered by this standard.

Some servicing operations do not expose employees to hazards which would necessitate that a machine, equipment or process be deenergized and locked out or tagged out. However, practices such as reaching beyond guards during the cleaning of rollers of printing presses or the feed points of screw conveyors which the equipment is operating, violate the safety conditions set forth in § 1910.212 for normal production operations, and therefore such activities would be considered servicing activities under this rule.

Performance of maintenance or servicing activities on a machine or equipment that is in operation has the potential of exposing employees not only to contact with moving machinery components at the point of operation, but also to contact with other moving components, such as power transmission apparatus, and also increases the risk of injury due to the position the employee must assume and the need to remove, bypass or disable guards and other safety devices. In many cases, these activities expose the employee to the hazard of being pulled into the operating equipment when parts of the employee's body, clothing or the material or tools used for cleaning or servicing become entrapped or entangled in the machine or equipment mechanism. The use of extension tools or devices to permit the operator to stay outside these danger areas, while of some benefit in reducing direct employee exposure to the hazards of entanglement or entrapment, can, in itself, result in injuries to employees. This can occur, for example, when an employee is struck by the tools or devices that inadvertently come in contact with moving machine components, and are pulled from the employee's grasp.

However, shutting down a machine or equipment usually is not the total solution to the problem. Once the machine or equipment has been stopped, there remains the potential for employee injury from the unanticipated movement of a component of the machine or equipment, or from movement of the material being handled. This unanticipated movement can be caused either by the release of residual energy within the machine or equipment, or as the result of the conversion of potential energy to kinetic energy (motion). For example, residual energy can be manifested by the presence of springs under tension or compression, or by the presence of pressure (either above or below atmospheric) in systems containing gases or liquids.

Potential energy is considered to be a function of the height of an object above some datum plane. This datum plane is usually considered to be where that object would come to rest if the restraint holding the object were released, such as where the upper die in a punch press is positioned above the lower die. If the restraining device holding the upper die in place was to be removed, the potential energy of the upper die would be converted into kinetic energy (downward motion), resulting in the upper die being propelled downward, coming to rest on the lower die. This motion can cause a crushing, cutting, lacerating, amputating or fracture injury to an employee's arm, hand or some other part of the body which occupies the space between the dies.

OSHA believes that the most effective method to prevent employee injury caused by the unanticipated movement of a component of a machine or equipment, or of the material being handled, is either to dissipate or minimize any residual or potential energy in the system, or to utilize a restraining device to prevent movement. This can be accomplished by moving machine or equipment components to a point at which springs are at or near a neutral state, by moving components so that liquids or gases reach or approximate atmospheric pressure, and by blocking material or components or moving them to a point of minimum potential energy (moving components to a stable, resting position).

Further, even though the machine or equipment has been shut off, and even if residual energy has been dissipated, an accident can still occur if there is an inadvertent activation of that machine or equipment. Inadvertent activation can occur due to an error on the part of the employee who is conducting the maintenance or servicing activity, or by any other person. For example, the servicing employee can unintentionally cause the machine or equipment to start by shorting across electrical switches or by accidentally moving controllers (either electrical controls or valves) into the "on" or "operational" position.

An accident can also occur when another person who is not necessarily involved with the maintenance or servicing operation causes the activation of the machine or equipment being serviced. This can occur when a person uses the wrong controller and starts a machine or equipment that the employee did not intend to start. It can also occur when a person finds a machine or equipment not operating and starts it, without knowing someone else is performing maintenance or service on it. This latter type of accident is more apt to occur when the machine or equipment is large and/or complex, and the employee who is conducting the servicing activity is at a part of the system which is some distance from or not visible from the controls. The generally accepted best means to minimize the potential for inadvertent activation is to ensure that all power to the machine or equipment is isolated, locked or blocked and dissipated at points of control, using a method that cannot readily be removed, bypassed, overridden or otherwise defeated. In the case of an electrically run machine, piece of equipment or process, this can be done by going back toward the original source of the power and shutting off a main switch or by disconnecting the electrical lines. OSHA believes that this action must be followed by the placement of some safeguard to prevent the reenergization of the circuit during the maintenance or servicing. To ensure that another employee will not attempt to restart the machine or equipment or to reenergize the circuit, there must be some assurance that all other employees know that the circuit is deenergized and must remain so. This can be accomplished by the utilization of a standardized procedure for deenergizing the system; by training employees to familiarize them with the restrictions of the procedure which apply to them; and by enforcing a prohibition on another employee removing or bypassing another's safeguard. Those employees whose job require them to opeate or use a machine or equipment that must have maintenance or servicing performed on it, must be aware that the machine or equipment is going to be stopped or shut down, and locked out or tagged out, and that they should not attempt to restart or reenergize it. Additional training is also needed for those employees who must utilize the procedure.

Even if all other protective measures are taken, accidents can still occur following the completion of the maintenance, repair or servicing activity, if the machine or equipment is reenergized and started before all guards and other safety devices have been replaced or reinstalled. Additionally, all tools and other foreign objects must be removed from the location and a check completed to ensure that no employees are in a place where the re-energization and starting of the machine or equipment will endanger them.

III. Accident Data

The collection of data on accidents resulting from a failure to utilize proper lockout or tagout procedures is hampered because many accidents are not reported; are reported only locally; or are reported and categorized under other causal factor categories (such as "caught-in" or "caught-between"). Incorrect or incomplete categorization is particularly true for lockout related accidents, since many of the injuries are grouped under the more commonly used classifications such as, burns, electrocutions, lack of machine guarding or equipment failure.

OSHA also recognizes that there has been some underreporting of accident data—either inadvertent or intentional. As a result, OSHA believes that the data available represent only a portion of the total injuries and fatalities that have occurred. However, OSHA believes that the accidents which have been recorded or reported and investigated or studied as being "lockout related" provide a graphic illustration of the extent of the problem, the causal factors, the distribution of accidents in industry, and the type and severity of injuries resulting from those accidents.

There have been several studies conducted to determine the magnitude and extent of the problem. These studies were conducted by: (a) The U.S. Department of Labor, Bureau of Labor Statistics; (b) OSHA's Office of Data Analysis (formerly Office of Statistical Studies and Analysis); (c) the National Institute for Occupational Safety and Health (NIOSH); (d) OSHA's Office of Experimental Programs; and (e) OSHA's Office of Mechanical Engineering Safety Standards. During the hearing, the UAW provided detailed data on fatalities and injuries (Tr. p. H216, H253), which they expanded upon in their post-hearing submission (Ex./ 3–49). The studies are discussed in the following paragraphs.

A. *Bureau of Labor Statistics Work Injury Report Study.* The first study examined by OSHA was the Work Injury Report Study entitled "Injuries Related to Servicing Equipment" [Ex. 3–3]. This study is a compilation of reports of accidents and follow-up survey questionnaires sent out by the Bureau of Labor Statistics (BLS). The survey, conducted from August to November 1980, covered workers who were injured while cleaning, repairing, unjamming or performing other non-operating tasks on machines, equipment and electrical or piping systems. BLS identified accidents from 25 participating states, and mailed each of the injured employees a follow-up questionnaire containing inquiries about the specific details of his/her accident. There were 1,285 questionnaires sent out and 833 (approximately 65 percent) of the employees responded. Not all questions were responded to by all participants, since many of the questions related to situations which may not have been relevant to the circumstances of each injury. In some instances, many of the respondents also gave multiple responses to a single question.

Tables I through VI present tabulations of the results of the BLS Work Injury Report Study.

TABLE I.—INDUSTRY DISTRIBUTION—BY STANDARD INDUSTRIAL CLASSIFICATION (SIC) MAJOR DIVISION AND COMPANY SIZE

Industry	Workers	Percentages (¹)
Total	833	100
Div A—Agriculture, forestry and fishing	12	1
B—Mining	1	
C—Construction	35	4
D—Manufacturing	619	74
E—Transportation and public utilities	19	2
F—Wholesale trades	57	7
G—Retail trades	31	4
H—Finance, insurance and real estate	8	1
I—Services	43	5
J&K—Others	8	1
SIZE OF THE COMPANIES AT WHICH ACCIDENTS OCCURRED		
Total	(²)794	100
1 to 19 employees	159	20
20 to 49 employees	123	15
50 to 99 employees	120	15
100 to 499 employees	234	29
500 or more employees	158	20

(¹) Due to rounding, percentages may not add to 100.

(²) The total of each table represent the number of respondents answering the pertinent question(s) of the survey.

TABLE II.—OCCUPATIONAL DISTRIBUTION

Occupation	Workers	Percent
Total	833	100
Operatives, excluding transport	373	45
Craft and kindred workers	281	34
Laborers, excluding farm	94	11
Service workers, excluding private household	19	2
Clerical and kindred workers	19	2
Managers and administrators	13	2
Professional, technical & kindred	12	1
Transport equipment operators	10	1
Farm laborers and supervisors	8	1
Nonclassified	4	(¹)

(¹) Less then .5.

Note.—Due to rounding, percentages may not add to 100.

TABLE III.—ACTIVITY OF TIME OF ACCIDENT

	Workers	Percent
WHAT WAS EMPLOYEE DOING?		
Total	833	100
Unjamming object(s) from equipment	250	30
Cleaning equipment	245	29
Repairing equipment	77	9
Performing maintenance (oiling, etc.)	34	4
Installing equipment	13	2
Adjusting equipment	99	12
Doing set-up work	57	7
Performing electrical work	29	3
Inspecting equipment	15	2
Testing material or equipment	2	(¹)

(¹) Less than 0.5 percent.

TABLE IV.—CIRCUMSTANCES OF INJURIES

	Workers	Percent (¹)
HOW DID INJURIES OCCUR?		
Total	833	100
Injured by moving machine part	735	88
Injured by contact with energized electric parts	45	5
Injured by burners, hot liquids or other hazardous materials	29	3
Injured by falling machine parts	10	1
Other	14	2
WAS EQUIPMENT TURNED OFF BEFORE DOING TASK?		
Total	833	100
No	653	78
Yes	180	22
IF EQUIPMENT NOT TURNED OFF, REASON(S) GIVEN.		
Total	(²)592	(²)
Worker felt it would slow down production or take too long	112	19
Not required by company procedure	69	12
Worker did not know how to	6	1
Did not think it necessary	209	35
Task could not be done with power off	209	35
Worker did not realize power was on	62	10
Other reasons	61	10
IF EQUIPMENT WAS TURNED OFF:		
a. What happened at the time of injury?		
Total	176	100
Injured employee accidentally turned equipment on	20	11
Co-worker accidentally turned equipment on	15	9
Co-worker turned equipment on, not knowing equipment was being worked on	56	32
Equipment or material moved when jam-up cleared	9	5
Parts were still in motion (coasting)	30	17
Other reason	46	26
IF EQUIPMENT WAS TURNED OFF:		
b. Were additional steps taken to de-energize equipment?		
Total	(²) 160	(²)
No—not necessary	49	31
No—not required by company	23	14
No—would slow down production	8	5
No—worker did not have tools	4	2
No—other reason	20	13
No—reason not given	37	23
Disconnected main power	14	9
Tagged out equipment power controls	6	4
Locked out(³), installed blank flange or removed fuse	3	2
Disconnected electric line	5	3
Drained pressure or hazardous material	9	6
Other	11	6

(¹) Due to rounding, percentages may not add to 100.

(²) Because more than one response is possible, the sum of the responses and percentages may not equal the total number of persons who answered the question.

(³) The two accidents which occurred after the equipment was locked out took place because (1) the lockout had been done to the wrong power line and (2) a second power line had been spliced into the wiring beyond the lockout.

TABLE V.—TRAINING

	Workers	Percent
WAS LOCKOUT INSTRUCTION PROVIDED EMPLOYEES?		
Total	554	100
Yes	214	39
No	340	61
IF INSTRUCTION PROVIDED, IN WHAT FORM?		
Total	273	100
Provided printed instructions	25	9
Procedures posted on equipment	37	14
Instruction given as part of on-the-job training	176	64
Formal training given at meeting, etc.	28	10
Other	7	3
WHEN WAS LOCKOUT INSTRUCTION GIVEN?		
Total	(¹)186	(¹)100
After the accident	15	8
One to six months before accident	36	19
Six months to a year before accident	28	15
Upon hiring	84	45
Over a year before accident	60	32

(¹) Because more than one response is possible, the sum of the responses and percentages may not equal the total. Percentages are calculated by dividing each number of responses by the total number of persons who answered the question.

TABLE VI.—ESTIMATED LOST WORKDAYS

Number of lost workdays	Workers	Percent
Total	793	100
No time lost	107	13
1 to 5 workdays lost	132	17
6 to 10 workdays lost	95	12
11 to 15 workdays lost	75	9
16 to 20 workdays lost	47	6
21 to 25 workdays lost	47	6
26 to 30 workdays lost	50	6
31 to 40 workdays lost	49	6
41 to 60 workdays lost	54	7
More than 60 workdays lost	41	5
No indication of number of lost workdays	86	11

B. *Analysis of 83 Fatality Investigations by OSHA's Office of Data Analysis.* The second study examined by OSHA was the compilation of data from 83 fatality investigations conducted by OSHA between 1974 and 1980. This report is entitled, "Selected Occupational Fatalities Related to Lockout/Tagout Problems as Found in Reports of OSHA Fatality/Catastrophe Investigations" [Ex. 3–5]. All of these accidents were identified as having been caused by failure to properly deenergize machines, equipment or systems prior to performing maintenance, repairs or servicing.

Tables VII through IX present tabulations of the results of the OSHA analysis of 83 fatality investigations.

TABLE VII.—CAUSAL FACTORS

Cause	Number	Percent
Total	83	100
Lack of adherence to safe work practices (no procedure or failure to follow procedure)	21	25
Accidental or inadvertent activation	29	35
Failure to deactivate	21	25
Equipment failure	7	8
Other	5	6

NOTE.—Due to rounding, percentages may not add to 100.

TABLE VIII.—NUMBER OF INJURY

Agent	Number	Percent
Total	83	100
Agitators and mixers	12	14
Rolls and rollers	11	13
Conveyors and augers	11	13
Saws and cutters	11	13
Hoists	8	10
Earth moving equipment	6	7
Crushers and pulverizers	4	5
Forges and presses	4	5
Electrical apparatus	4	5
Vehicles	3	4
Other	9	11

TABLE IX.—EMPLOYEE ACTIVITY

Activity	Number	Percent
Total	83	100
Conducting normally assigned duties	69	83
Conducting other duties	14	17

In analyzing the 83 fatality investigation reports and assigning causes to each accident, no attempt was made to draw conclusions or inferences beyond the information contained in the reports. For example, if the employee was killed in operating machinery, unless the report stated otherwise, the cause of the accident was considered to be failure to shut off the machine, rather than a combination of causal factors such as failure to shut off the machine, failure to lockout, failure to document adequate procedures, and failure to provide sufficient employee training. Additionally, if a machine was found to be running, it was assumed that the employee failed to shut off the machine rather than that another employee restarted the machine.

C. *Analysis of 125 Fixed Machinery Fatalities by OSHA's Office of Data Analysis.* A separate study by OSHA's Office of Data Analysis is entitled "Occupational Fatalities Related to Fixed Machinery as Found in Reports of OSHA Fatality/Catastrophe Investigations" [Ex. 3–6]. This study contained an analysis of investigative reports of 125 fatalities involving fixed machinery which occurred between 1974 and 1976, and which were investigated by OSHA. The primary causal factors under which the accidents were classified were operating procedures, accidental activation, lack of machine deactivation, equipment failure, and other causes.

The following is a tabulation of the results of this study.

TABLE X.—CAUSAL FACTORS, OSHA ANALYSIS OF 125 FATAL ACCIDENTS

Causal factor	Number	Percent
Total	125	100
Failure to adhere to safe operating procedures	41	33
Accidental machine activation	31	25
Machine not deactivated	23	18
Equipment failure	21	17
Other	9	7

D. *National Institute for Occupational Safety and Health, Guidelines for Controlling Hazardous Energy During Maintenance and Servicing and Study of Hazardous Release of Energy Injuries in Ohio in 1983.* The next studies considered by OSHA were done by the National Institute for Occupational Safety and Health (NIOSH) [Ex. 4 and 2–80c]. In the first, fifty-nine out of a total of 300 accident reports were analyzed to illustrate situations in which adequate control of energy might have prevented the accidents. These case files were selected because they contained sufficient detail to enable NIOSH to evaluate the accidents and determine what countermeasures might have been available to prevent the accidents.

The report indicated that these types of accidents are preventable if effective energy control techniques are available, the workers are trained to use them, and management provides the motivation to ensure their use.

The following is a tabulation of the results of the first study.

TABLE XI.—CAUSAL FACTORS, NIOSH STUDY

Factor	Number	Percent
Total	59	100
Failure to de-energize machine or control energy	27	46
Accidental re-energization	25	42
Ineffective energy isolation	6	10
Disregarding residual energy	1	2

The NIOSH draft report, undated, entitled: "Study of Hazardous Release of Energy Injuries in Ohio in 1983." (Ex 2–80c).

This report contains information on 339 accidents which occurred in the state of Ohio in 1983. These accidents were selected because: (1) They fell into likely categories of industry, occupation, type of accident, source of injury and diagnosis of injury; (2) the worker's compensation claim narrative suggested applicability; and (3) questionnaire reponses by plant officials positively identified the injuries as resulting from an unexpected energy release during equipment repair, servicing or maintenance. The report defined an unexpected or unwanted release of energy "as when a press closes on an operator's hand or when steam escapes from a broken pressure line."

The "Ohio Study" was submitted by NIOSH in draft form. OSHA is not aware of whether the study results have since been finalized by NIOSH, or whether any further effort has been expended to follow-up on its findings. However, OSHA has evaluated the draft study and has determined that few definite conclusions can be drawn from the available data. For example, most of the injuries reported in the study (70%) occurred to production workers as a result of servicing which took place during normal production operations. Although the study indicated that firms where injuries occurred used tagout, it did not indicate whether either tagout or tagout procedures were applied in situations where production employees were performing servicing work, as well as maintenance employees. Without such information, it is not possible to determine whether the tagout procedure failed in situations where it was being applied, or whether tagout (or other type of employee protection, such as shutting down the equipment) was in use at the time of the accident. In addition, the study only considered the issue of locks versus tags, and did not evaluate the other elements of the lockout or tagout programs in place. As OSHA has emphasized, the adequacy of a program for the control of hazardous energy relies on much more than whether a lockout device or a tagout device issued on the energy isolating means. Therefore, the Agency has determined that the draft Ohio study raises many more questions than it answers, and that no solid conclusions can be drawn from the data provided to date. OSHA encourages NIOSH to continue its review and analysis of this study, and looks forward to receiving a final version of the study after a full evaluation and revision has been performed.

The following is a tabulation of the usable results of this study.

TABLE XII—TASK BEING PERFORMED AT TIME OF ACCIDENT

Task	Number	Percent
Unjamming object	84	25
Cleaning equipment	75	22
Repairing equipment	41	12
Adjusting equipment	41	12
Doing set-up work	27	8
Inspecting equipment	11	3
Testing equipment	9	3
Installing equipment	9	3
Electrical work	8	2
Other tasks	34	10
Total	339	100

TABLE XIII.—EQUIPMENT MODE WHEN INJURY OCCURRED

Equipment mode	Number	Percent
Production mode	230	70
Maintenance mode	99	30
Total	[1]329	100

[1] Ten respondents did not identify the equipment mode.

F. *Analyses of Fatality/Catastrophe Reports and General Duty Clause Citations by OSHA's Offices of Experimental Programs and Mechanical Engineering Safety Standards.*

There were two additional OSHA studies which were conducted jointly by the Office of Experimental Programs and the Office of Mechanical Engineering Safety Standards. These studies were compilations and analyses of OSHA Form 36 reports [Ex. 3–7] and OSHA 5(a)(1) citations [Ex. 3–8], respectively.

An OSHA Form 36 (Preliminary Fatality/Catastrophe Event Report) is prepared each time an Area Office is notified of a serious accident resulting either in a fatality or in serious injury to five or more employees that necessitates their hospitalization. This report is used to determine whether or not OSHA will conduct an investigation of the circumstances surrounding the accident. Since OSHA does not receive notification of all accidents resulting in a fatality or catastrophe, the total number of Form 36 reports received does not equal the total number of workplace fatalities and serious injuries which occurred during this study period. However, OSHA believes that the causes of, and the circumstances leading to, the accidents clearly demonstrate the nature and seriousness of lockout/tagout-related accidents.

The OSHA Form 36 study which analyzed data reported during the period 1982–1983 [Ex. 3–7], utilized a list of 443 fatalities. From these fatalities, all of which occurred in industries subject to the present regulations, it was determined that 36 (8.1 percent) would have been prevented by the use of an effective lockout or tagout procedure.

The second study [Ex. 3–8] used information developed by OSHA's Office of Mechanical Engineering Safety Standards which identified, categorized and recorded "general duty clause" (section 5(a)(1) of the OSHA Act) citations from 1979 to 1984. A general duty clause citation is issued when, during an inspection, a "recognized hazard" is detected which is causing or is likely to cause death or serious physical harm to an employee, but which is not addressed in an OSHA standard applicable to that industry.

The citations in the latter study have been broken down between maritime, construction, and general industry. The general industry citations were further subdivided to reflect the nature of the hazard which the citation addressed, such as hazardous materials or material handling. When there was special Agency interest in an industry or hazard, the citations were further broken down by industry sector (such as oil and gas well drilling).

From 1979 through 1984, 3,638 inspections were conducted which resulted in the issuance of general duty clause citations. Of these 3,638 inspections, there were 376 inspections in whcih the failure to control hazardous energy was cited. Hence, in approximately 10 percent of all inspections which resulted in the issuance of at least one General Duty clause citation, herein referred to as a 5(a)(1) citation, failure to lockout or tagout was identified. [Ex. 3–8]

The following is a tabulation of the breakdown of lockout citations by industry division.

TABLE XIV.—INDUSTRY PROFILE, OSHA 5(a)(1) LOCKOUT CITATIONS

Industry divisions	Number of citations	Percent
Total	376	100
A—Agriculture, forestry and fishing	2	.5
B—Mining	4	1.1
C—Construction	18	4.8
D—Manufacturing	310	82.4
E—Transportation and public utilities	11	2.9
F—Wholesale trades	14	3.7
G—Retail trades	5	1.3
H—Finance, insurance and real estate	0	0
I—Services	12	3.2
J—Public administration	0	0
K—Not otherwise classified	0	0
Unknown	0	0

Note.—Due to rounding, percentages may not add to 100.

At the hearing, the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW) testified that there were 74 fatalities which it referred to as "lockout fatalities," which had occurred to its members between 1973 and 1988 (Tr. H253). In response to requests at the hearing, the UAW provided additional information on these fatalities (Ex. 49E). (The number of "lockout fatalities" was revised to 72 in the post-hearing submission.) The post-hearing data reinforce OSHA's determination that fatalities from hazardous energy sources involve more than simply a failure to "lock out" machines or equipment. Of the 72 fatalities, UAW reported that there had been "inadequate training" in 49 cases (68%); "inadequate procedures" in 50 cases (69%); and "adequate, but unenforced procedures" in 19 cases (26%). Although OSHA agrees that lockout provides more security against reenergization of equipment than tagout, the Agency is convinced more than ever that there is much more to energy control than the question of lockout vs. tagout. The UAW data make a strong case for the need for OSHA to provide for proper energy control procedures and adequate training in those procedures.

In the proposal, OSHA estimated, based on BLS data, that lockout or tagout related fatalities represented 7% of the total number of occupational fatalities. In their post-hearing comment, the UAW indicated that for their workers, this figure is estimated to be 26%, and that OSHA should take this larger estimated percentage into account in its projections. The UAW also argued that its data base is larger than that used by OSHA, and that it is more reliable because of its national scope and inclusion of both large and small facilities. (Ex. 49A). OSHA appreciates the time and effort taken by the UAW in compiling such data and in submitting it to the rulemaking record. At the time of the proposal, the Agency acknowledged that its injury and fatality figures were likely to be understated for various reasons. Regardless of whose figures are used, there is little doubt that the failure to control hazardous energy sources exposes employees to a significant risk, and that this standard is necessary to reduce those risks.

IV. Basis for Agency Action

OSHA believes that there exists a sufficient body of data and information upon which a reasonable standard can be based to reduce the number of fatalities and injuries resulting from failure to utilize proper and adequate practices and procedures for the control of potentially hazardous energy. This position is based upon an analysis of the accident data available to OSHA, all of which is in the docket of this rulemaking proceeding.

Most accident reports break down the relevant information in accordance with the classifications contained in the American National Standards Institute, ANSI Z16.2, "Method of Recording Basic Facts Relating to the Nature and Occurrence of Work Injuries" [Ex. 3–11]. These classifications are: The nature of the injury, part of the body, source of the injury, accident type, hazardous condition, agent of injury and unsafe act. Many accident reports are generated primarily to document the occurrence of accidents and concentrate on the information which is necessary to process workers' compensation claims. For this reason, they tend to emphasize information about the injury rather than the events and conditions which caused the accidents. Therefore, most of the pertinent information identifying the nature and extent of the problem of controlling hazardous energy was gathered by OSHA by conducting the special studies referred to above. Because of the limitation on the available data, no single study in itself can be expected to provide conclusive support for comprehensive regulation of energy hazards. However, the studies and other available data, when considered as a whole, clearly indicate not only the scope and extent of the problem, but also the need for a comprehensive standard. The studies are consistent in their demonstration of the causative factors involved in lockout-related accidents, and they provide strong evidence for the potential effectiveness of OSHA's Final Rule in dealing with those factors.

OSHA believes that the hazards associated with the failure to control hazardous energy are widespread. The following table indicates the distribution, by industry, of the accidents reported in the Bureau of Labor Statistics (BLS) Work Injury Report Study (WIR) and in the OSHA 5(a)(1) study citations discussed earlier.

TABLE XV.—INDUSTRY PROFILE, BLS WIR AND OSHA 5(a)(1) CITATIONS

Industry (by division)	BLS	Percent	5(a)(1)	Percent
Total	833	100	376	100
A—Agriculture, forestry and fishing	12	1	2	.5
B—Mining	1		4	1.1
C—Construction	35	4	16	4.3
D—Manufacturing	619	74	310	82.4
E—Transportation and public utilities	19	2	11	2.9
F—Wholesale trades	57	7	14	3.7
G—Retail trades	31	4	5	1.3
H—Finance, insurance and real estate	8	1	0	0
I—Services	43	5	12	3.2
Other or unknown	6	1	0	0

Although employees in almost every industrial division are exposed to the hazards associated with the unexpected energization or start up of machines or equipment, or by the unanticipated release of stored energy, the preponderance of the accidents and injuries occur in Manufacturing (Division D). It should also be noted that Services (Division I), includes many employers who perform maintenance on equipment in manufacturing and other sectors covered by Part 1910.

In addition to the accidents which could occur when maintenance or servicing is being conducted, OSHA also identified some accidents which could occur while employees are lubricating, cleaning, unjamming or adjusting machines or equipment. These activities differ from other activities which are conducted during normal operation in that these activities can lead to the unexpected release of energy and are usually done only on an as-required basis. When these activities are being conducted during normal operations, the machine guarding required by other OSHA standards (that is, § 1910.212 for point of operation guarding and § 1910.219 for power transmission apparatus guarding) may afford the necessary and sufficient protection for the employees performing those activities. However, in many instances the employee must either remove guards or other safety devices or work under unusual circumstances which would subject the employee to a different or greater risk than would be encountered during normal production operations. In those instances OSHA believes that the machine or equipment must, if possible, be shut down and locked or tagged out to protect the employee from injury.

As noted earlier, OSHA's has evaluated section 5(a)(1) citations that were issued for failure to control hazardous energy, and has determined that this area accounts for about 10 percent of the serious hazards not presently covered by a specific OSHA standard. The seriousness of the hazard to be addressed by this standard is highlighted by the fact that section 5(a)(1) citations are issued only for recognized hazards which cause or are likely to cause death or serious physical harm. Similarly, the OSHA Form 36, also discussed above, is initiated only when OSHA is notified of deaths or multiple hospitalizations. Further analysis of the lost workday data from the BLS WIR indicates that the severity of injuries from failure to control hazardous energy sources (an average of 24 lost workdays per lost time injury) is much higher than the national industry-wide average of 16 lost workdays [Ex. 14].

In developing this Final Rule, OSHA has estimated the total numbers of fatalities, lost-workday injuries, and minor injuries attributable to lockout-related accidents. These estimates were based on an extrapolation of the available national data sources discussed earlier [Ex. 3, 5, 6, 7]. From these data the number of preventable accidents was determined. OSHA believes that the Final Rule will prevent 85% of the total numbers of injuries or fatalities from exposure to hazardous energy in the workplace. The Agency estimates that approximately 31,900 minor (non-lost-workday) injuries; 28,400 lost-workday injuries; and 122 fatalities per year (based on 1984 accident levels) will be prevented by this standard. (see Section on Regulatory Impact Analysis below). These estimates were derived by identifying the percentage of accidents in various data sources which were determined to be lockout-related and applying those percentages to the number of accidents. It was determined that two percent of all nonfatal accidents and 7.1 percent of all fatalities occurring in general industry related to failure to adequately control hazardous energy. In addition, the data indicate that the risk of accidents and injuries is independent of the number of employees in a particular workplace. This finding is predicated upon the distribution by size of the companies which employed the injured employees surveyed in the BLS WIR. In the survey, almost as many respondents (392, or 49 percent) reported that they were employed at facilities of 100 or more employees as those who were employed at facilities of less than 100 employees (402, or 51 percent).

Based upon analysis of all of the aforementioned evidence, OSHA believes that the failure to control hazardous energy results in a significant risk to employees. Further, the data clearly demonstrate that the consequences of an accident involving failure to lockout or tagout are more severe in terms of lost workdays than the average industrial accident. OSHA also believes that a significant risk from hazardous energy extends across many segments of general industry.

OSHA has also analyzed the studies to determine the underlying causes of the conditions which existed when lockout related accidents occurred. From this information, OSHA developed a list of measures which would have prevented most of the accidents in the studies, and used this list to devleop its proposed standard. It should be noted that the studies vary widely in the quantity and quality of the information provided for the reported accidents (different methods of reporting, and incompleteness of the findings of the causes of the accidents, for example). Therefore, professional judgment was used in the interpretation of the results of the studies, in order to provide a comprehensive evaluation of the data and to correlate the information on accident causation. While the numbers and percentages from all studies do not necessarily agree, the studies all indicate the existence and seriousness of the problems, and provide valuable information as to measures that are necessary to correct the problems. Tables XVI through XX below cover what OSHA believes are the major causal factors in lockout-related accidents, and indicate the prevalence of such factors as reflected in the different accident studies.

TABLE XVI.—SERVICING ACCIDENTS OCCURRING WHILE EQUIPMENT IS OPERATING

Study (total considered)	Number	Percent
BLS WIR (833)	653	78
OSHA analysis of 83 fatalities (83)	54	65
OSHA report of fixed machinery (125)	23	18
NIOSH study (59)	27	46

The reasons most often given in the BLS WIR for not turning off equipment prior to servicing were that it would take too long or slow down production; it was not required by the employer; it was not necessary; or the task could not be done with the equipment off.

As pointed out in the Hazards section of this Notice, just shutting off a machine, equipment or process may not completely control the hazardous energy. Even after a machine, equipment or process is shut down, residual energy may still be present in the form of moving components, spring or hydraulic pressure, the force of items which have become jammed in machine parts, or the energy which is stored in machine, equipment, or system components due to their position (potential energy).

TABLE XVII.—ACCIDENTS DUE TO FAILURE TO ENSURE POWER OFF

Study (total considered)	Number	Percent
BLS WIR—Failure to check for power on (592)	62	10
OSHA analysis of 83 fatalities (83)	5	6
NIOSH study (59)	6	10

The Hazards section of this Notice also discussed the fact that even though the machine, equipment or process has been shut down, and the residual energy controlled or dissipated, an employee can still be injured if the machine, equipment or process is restarted by either that employee or another employee. Injury can occur when an employee inadvertently contacts switches, valves or other controllers or when an employee activates the equipment without recognizing the reason it was shut off, inadvertently exposing other employees to a hazard.

TABLE XVIII.—ACCIDENTS DUE TO INADVERTENT ACTIVATION

Study (total considered)	Number	Percent
BLS WIR (176)	91	52
OSHA analysis of 83 fatalities (83)	29	35
OSHA report on fatalities related to fixed machinery (125)	31	25
NIOSH (59)	25	42

Clearly, it is insufficient simply to shut off machinery to conduct repair, maintenance or servicing. OSHA believes that some means must be utilized to ensure that employees are safeguarded during those operations.

After servicing, there is also the need to ensure that all guards have been replaced, that all tools and other extraneous materials have been removed from the machine, equipment or process, and that reenergizing and starting normal productions operations will not subject an employee to an increased potential for injury. This is especially true when the maintenance, repair or service is conducted at or near an employee's workstation.

OSHA believes that many of the problems of de-energization and reenergization of machines or equipment can be reduced by the employer's development and utilization of a program which incorporates a program which incorporates a standardized procedure for servicing/maintenance operations. The procedure would outline the necessary steps to be taken to prepare for, conduct, and complete servicing of equipment, and the program would provide employees with an understanding of the procedure and the reasons why it must be followed. A program can provide the details to be followed in performing servicing operations safely (the procedure), together with the training and motivation needed to assure that employees understand and implement those details.

TABLE XIX.—ACCIDENTS ATTRIBUTABLE TO EMPLOYER NOT HAVING OR EMPLOYEES NOT UTILIZING A PROCEDURE

Study (total considered)	Number	Percent
BLS WIR (653)	482	74
OSHA report on fatalities related to fixed machinery (125)	41	33

OSHA believes that employee understanding and utilization of a standardized procedure are critical to the success of a lockout or tagout program. Without these elements and commitment from management, the effectiveness of the program can be seriously compromised. Proper training in the procedure, and explanation of how it works and why, are crucial to its implementation by the employees. Even though there can be no exact quantification of the effects of training employees, the BLS WIR Study gives an indication of the effect of the *lack* of training in the necessary measures to be taken in deenergizing machines or equipment (see Table XX below).

TABLE XX.—LOCKOUT TRAINING OF INJURED EMPLOYEES, SOURCE: BLS WIR (FROM 613 RESPONSES)

Type of training	Number	Percent
Printed instruction	25	4
Procedures posted on equipment	37	6
Training at job orientation, at meetings, or otherwise	211	34
No training	340	55

Of those injured employees who had received training, 15 stated that their training had occurred *after* their accident. Additionally, 60 employees stated that they had received their training more than a year prior to the accident. Even though training has been provided at some time during employment, the length of time between the receipt of the training and the accident is a limiting factor on any beneficial effect that has been derived from the training. In the Final Rule, discussed below, OSHA recognizes the need for remedial or refresher training of those employees who must use the procedure, and that such retraining must be conducted at least annually.

Based upon an analysis of the rulemaking record, OSHA believes that the safe performance of activities such as repair, maintenance and servicing, requires the deenergization of machines or equipment whenever feasible. Further, in order to ensure that maintenance or servicing activities are conducted safety, a lockout or tagout procedure must be utilized. This procedure must call out the steps to be taken to deenergize the machine, equipment or process; to ensure that the deenergization is sufficiently complete; to dissipate or prevent the release of residual energy; to ensure that the machine, equipment or process cannot be reenergized accidentally or unexpectedly; and to ensure that the reenergization is accomplished safely. The establishment and utilization of this procedure must be coupled with sufficient initial and follow-up training to ensure the successful utilization of the procedure.

V. Major Issues

The evidence submitted to the record is summarized and evaluated in the following discussion of each major issue and in the Summary and Explanation of this Final Rule. The numbers in brackets refer to specific written comments (Ex. —) and to the transcript page number of the testimony presented at the public hearing (Tr. p. (W for Washington, DC and H for Houston, TX) —).

1. Should OSHA require the use of locks, locks and tags, or tags alone to control potentially hazardous energy?

The most vigorously contested issue was the need to use locks or tags as the primary means to prevent the accidental operation of energy isolating devices, such as electrical disconnects, hydraulic or pneumatic valves. The proposed standard did not establish definitive criteria for employers to use in making their choices of control measures, that is, the use of locks, tags or a combination of the two.

In general, a strong preference was evidenced in the comments and hearing testimony for locks. Many parties to this proceeding (Ex. 2-2, 2-12, 2-27, 2-29, 2-42, 2-44, 2-57, 2-63, 2-66, 2-67, 2-79, 2-98, 2-99, 2-103, 2-104, 2-106, 48, 50, 58, 59, 60, 62, 63, Tr. pg. W1-68, W1-71, W1-85, W1-138, W1-141, W1-143, W1-185, W1-192, W1-233, W1-241, W1-249, W2-80, W2-91, H30, H89, H96, H129, H136, H142, H149, H153) stated that the use of locks was the only acceptable means to control hazardous energy. Some of these commenters (Ex. 2-2, 2-44, 2-63, 2-79, 2-98) argued that the use of tags alone did not afford a minimum acceptable level of protection for employees since, as opposed to locks, they could be carelessly bypassed without major effort. Several commenters (Ex. 2-27, 2-29, 2-63, 2-104, Tr. pg. W1-75, H-225) stated that the unrestricted use of tags as the primary means of safeguarding employees during maintenance or servicing of machines and equipment would seriously erode the gains which had been achieved through past labor-management negotiations. Other commenters (Ex. 2-44, 2-57, 2-63, 2-79, 2-98, 2-99, Tr. pg. W1-71, W1-72, H-220) stated that tags were susceptible to being lost or damaged in use due to environmental conditions in the workplace or by contact by employees, materials or equipment moving or being moved about the workplace. These commenters stated that tags only "warn" and that they are a label, not a safety device. Other commenters (Ex. 2-106, Tr. pg. W1-72) stated a view that, the use of tags also promotes a false sense of security among employees and that the accident rate when tags alone are used is higher than when not using any safeguard.

One participant, an employee of Armco Steel (Tr. pg. W2-91), stated that his employer had discontinued the use of tags in favor of locks. He contended that the Company realized that the use of tags alone was not effective in preventing accidents.

Finally, several commenters (Ex. 2-42, 2-79, 2-98, 2-106, Tr. pg. W1-72, W1-138, W1-140, H98, H129, H163) stated that tags can be easily defeated by negligence or ignorance and that the use of tags will not deter the willful misconduct of the employee who would ignore the message of the tag, that is, not to reenergize or restart a machine or piece of equipment.

The record contains a significant body of evidence which indicates that the "one person, one lock, one key" concept enjoys wide acceptance across industry lines. For example, the United Auto Workers provided comments (Ex. 2-24, 20) and testimony (Tr. pg. H215-354) on the use of this concept in the automotive industry. Monsanto Company stated (Ex. 3-52, attachment II) that this form of lockout protection represented their basic approach to lockout/tagout. Monsanto indicated that tagout is only used in situations "where the work is relatively low hazard and the person is in control of the energy source," such as light switches, some valves, and some plug and cord connected equipment. Monsanto also noted that group lockout is used for equipment which requires a relatively large number of servicing workers, with a large number of points to be locked out.

On the other hand, several commenters (Ex. 2-33, 2-55, 2-94, 2-96, 2-102, 2-105, and Tr. pg. W1-144, H197) stated that their companies utilize a system of tags to ensure that equipment which has been shut down will not be reenergized or restarted. One of these commenters (Tr. pg. H198) stated that the tagout system utilized by his company is "well understood by all employees. In fact, we feel so strongly about our red/danger tag procedures that we require mandatory discipline for its violation." The company submitted its safety record as support for its assertion that its tagout program is effective. The employees of this company have worked over 488 million hours between January 1980 and September 1988 with only 130 lost time accidents. Of those 130 accidents, only one occurred which was marginally related to tagout. That one accident occurred because there was no valve to guard against the transfer of heat through another closed and tagged valve. Finally this commenter stated, "The key to safety is not in a specific device, be it tag or lock. [Safety] rather, lies in good procedures and careful training combined with assurance of accountability. If these three principles are in place, a system which uses tags only will adequately protect employees. A lockout requirement in addition to tagout will not assure greater safety." (Tr. pg. H199.)

Even 2 commenters (Ex. 2-67, Tr. pg. W1-75, W1-167), who spoke out against the use of tags admitted that there might be instances in which lockout would be either impractical or impossible. However, one commenter (Tr. pg. W1-97) stated that problems, such as the loss of computer memory by shutting off automated equipment, could be overcome. Retention of the computer memory could be accomplished by providing a separate energy source for the computer so that the energy used to power the movable portions of the mechanism could be shut off and locked out without affecting the computer memory. This commenter stated that other innovative means are possible for solving other similar problems.

Other commenters (Tr. pg. W1-139, W1-157) stated that there is no data available on accidents which have occurred when machines or equipment are tagged out.

Several commenters (Tr. pg. W1-105, W1-139, W1-164) suggested tagging should be used only with an increased

emphasis on training, supervision, controlled access and employer commitment.

Much of the testimony and comment received in this rulemaking has focused on whether the standard should require lockout as opposed to the proposed approach of allowing lockout or tagout. In a sense, it was unfortunate that attention was focused more on a single aspect of the standard, though it is certainly an important one, than on the standard taken as a whole. The proposed standard was intended to specify that the employer provide a comprehensive set of procedures for addressing the hazards of unexpected reenergization of equipment, and the use of locks and/or tags was intended to be only a single element of the total program. In order to provide adequate protection to employees, the Final Rule, as did the proposal, requires employers to develop and utilize a comprehensive energy control program consisting of the development and utilization or procedures and training of employees. The procedures must consist of steps for deenergization of equipment, isolation of the equipment from energy sources, and verification of deenergization before servicing and maintenance is performed on equipment, and the employees who either perform the servicing or maintenance or are affected by those operations must be properly trained in the energy control procedures which apply to their work.

It should be noted that locks and tags by themselves do not control hazardous energy. It is the isolation of the equipment from the energy source and the following of the established procedures for deenergization and reenergization of the equipment that actually controls the energy. Locks and/or tags are attached to the disconnects and other energy isolating mechanisms after the machine or equipment has, in fact, been isolated, in order to prevent them from being reenergized before the work has been completed. If the equipment has not been properly deenergized, and if proper procedures have not been followed, neither a lock nor a tag will provide protection.

The treatment of lockout vs. tagout presents OSHA with a difficult regulatory dilemma. On the one hand, if the issue were simply whether a lock or a tag will be better able to prevent equipment from being reactivated, there is no question that a lock would be the preferred method. Locks are positive restraints which cannot be removed (except through extraordinary means such as bolt-cutters) without the use of a key or other unlocking mechanism. By contrast, the limitations of tags used alone are self-evident: They do not serve as positive restraints on energy isolating devices, but are only warnings to employees that the equipment is not to be reenergized. Tags not fastened with a strong material can become detached from the energy isolating device by wind or other environmental conditions, and the legend on some tags can be rendered illegible if the tag becomes wet. Tags may not provide protection if there are affected employees who do not read English or who have not been properly trained in the tagging system and its implementation.

However, the issue in this rulemaking is not merely on the use of lockout vs. tagout, but rather the use of locks and/or tags in a comprehensive program of energy control. As was noted in the preamble of the proposed rule (53 FR 15496, April 29, 1988), OSHA is aware of workplaces in which tagout systems are used with great effectiveness. In particular, various electric utilities and chemical plants report that they have used tagout in lieu of lockout successfully for many years (cf. Tr. H194-214; W2.2-3—2-39). In evaluating these industries, OSHA has determined that there are several factors which have contributed to their successful use of tagout programs: first, these companies have implemented detailed energy control procedures which are quite similar to those set forth in both the proposed and final lockout/tagout standard; second, they have established and utilized extensive training programs to teach their employees about their energy control procedures, including the use of tags and the importance of obeying them; third, these companies reinforce their training periodically. However, it is the fourth common element, discipline, which appears to be the most critical to the success of these programs; the companies with effective tagout programs apply various types of disciplinary action to both supervisors and employees who violate the tagout procedures.

OSHA believes that an effective tagout system needs all four of these elements to be successful. However, it is the fourth element, discipline, which is the most difficult to incorporate into a regulatory approach in the Final Rule. Not surprisingly, it also reflects the most serious limitation of tagout which does not arise with lockout. Because a tagout program does not involve positive restraints on energy control devices, it requires constant vigilance to assure that tags are properly applied; that they remain affixed throughout the servicing and maintenance of equipment; and that no employee violates the tag by reenergizing the equipment, either intentionally or inadvertently, before the tag is removed. By contrast, a lockout device, once applied, cannot inadvertently be removed, and cannot be removed intentionally by an unauthorized person except by the use of force.

In the Final Rule, OSHA has determined that lockout is a surer means of assuring deenergization of equipment than tagout, and that it should be the preferred method used by employees. However, the Agency also recognizes that tagout will nonetheless need to be used instead of lockout where the energy control device cannot accept a locking device. Where an energy control device has been designed to be lockable, the standard requires that lockout be used unless tagout can be shown to provide "full employee protection," that is, protection equivalent to lockout. These requirements will be discussed in detail in the summary and explanation of the standard, below.

The Agency believes that except for limited situations, the use of lockout devices will provide employees with a more secure and more effective means of assuring that equipment will not be reenergized while they are working on it. To the extent that equipment is capable of being locked out during servicing or maintenance, OSHA believes that it should be locked out. It should be noted, in this regard, that a number of General Industry standards, such as § 1910.305(j)(4) in Subpart S-Electrical, presently require electrical disconnects to large motors to be capable of being locked out.

According to OSHA's Regulatory Impact Analysis, approximately 90% of all electrical energy isolating devices (disconnects) and about ⅔ of all energy control valves are currently capable of being locked out. As previously discussed, the capability for lockout does not necessarily mean that the equipment has an actual hasp or other physical attachment point for a lock. For example, the use of chains can be an effective means of facilitating lockout of many types of valves, even if the valve does not have a specific locking point. Many examples of equipment which was made lockable with minor modifications have been provided to the record. For equipment of this type, OSHA believes that the lockout capability should be used in order to maximize the protection afforded by this standard.

OSHA also acknowledges that certain types of energy isolating devices currently in place are not capable of being locked out. Such equipment would need to be replaced with or modified significantly to accept locking-type mechanisms in order to become capable of being locked out. This equipment constitutes a relatively small percentage of all equipment to be covered by this standard, and will primarily involve valves rather than electrical disconnects. OSHA believes that where equipment replacement and major equipment modification would be necessary for the equipment to accommodate a lockout device, such efforts are most effectively and efficiently achieved as part of the normal replacement cycle for the equipment, rather than through a specific requirement for retrofitting within a set time frame in this standard. OSHA believes that it is much more cost-effective and protective to design a locking capability into equipment than it is to perform a major retrofitting of that equipment solely to incorporate lockout, for several reasons. First, there are situations in which locking out of equipment can create other, and sometimes greater, hazards to employees. The retrofitting of such equipment for the sole purpose of incorporating a lockout capability would not necessarily deal with the additional hazards. By contrast, the incorporation of a lockout means into the design of new equipment is far less costly than modifying equipment which was not designed to be locked out. Third, incorporating a lockout capability into either new or overhauled equipment is a far less complex task from a technological standpoint, since the locking aspect is a small part of the overall design.

Surprisingly, although there was considerable evidence submitted on equipment for which lockout is currently being used, this rulemaking provided OSHA with little new information on the costs or feasibility of extending lockout requirements to equipment which is not currently capable of being locked out. Therefore, OSHA is unable to conclude with any degree of certainty that a requirement to retrofit all such equipment would be feasible, nor is the Agency able to determine the amount of time or resources that would need to be expended to achieve compliance. For such equipment, OSHA will allow employers to use the less restrictive tagout programs, but only until the equipment is replaced, or until major rehabilitation or modification is performed on it. At that time, the new, overhauled, or modified equipment must be equipped with lockout-capable energy isolating devices, and the energy control procedure for the servicing of that equipment must be revised to make use of that capability, except if the employer can demonstrate that tagout will provide equivalent protection.

OSHA is confident that this standard is a cost-effective approach to providing protection against hazardous energy sources. It recognizes that lockout is, in general, preferable to tagout as a method of assuring that deenergized equipment is not inadvertently or accidentally reenergized. It requires that the employer develop and implement an energy control program and procedure for servicing and maintenance of machinery and equipment, using lockout or its equivalent on the great majority of energy isolating devices, namely those which are currently capable of being locked out. For energy isolating devices which do not yet have a lockout capability, the standard allows the interim use of tagout, but lockout-capable energy isolating devices must be installed when that equipment is replaced or overhauled. The standard is written in performance-oriented language, providing considerable flexibility for employers to tailor their energy control programs and procedures to their particular circumstances and working conditions. OSHA is confident that this standard will greatly reduce the toll of injuries and fatalities which occur each year from the failure to control hazardous energy in general industry workplaces.

A critical element of this standard is the determination of whether an energy isolating device is "capable of being locked out." In its most limited sense, a device would be considered to be "capable of being locked out" either if it was designed with a hasp or other integral part to which or through which a lock could be affixed, or if it has a locking mechanism built into it. However, OSHA's use of the term for the purposes of this standard is somewhat broader, without being overly expansive. OSHA considers equipment to be capable of being locked out if the use of a locking mechanism will not require the employer to dismantle, rebuild, replace, or alter in a permanent way the energy control capability of the isolating device. For example, although some valves and other energy isolating devices are not designed with an integral means of being locked, they can be secured with chains, blocking braces or wedges, which then can be locked. Because extensive equipment modification is not needed in this situation, OSHA views this type of lockout to be both technologically and economically feasible. However, a specific energy isolating device is not considered as having the capability of being locked out if the device is installed within a single cabinet, enclosure or cutout box containing several other energy isolating devices or valves and where the only preventing access to the energy isolating device or valve can be locked out individually, tags must be used and must be attached to the specific energy isolating device and not simply attached to the cabinet or enclosure door or cover. By contrast, as noted earlier, some types of valves and disconnects would require total or partial replacement in order to provide the equipment with a lockout capability.

2. Should OSHA require employee participation in the development of lockout procedures and the training programs required by this standard?

There was considerable comment on the part of labor unions (Ex. 2-29, 2-44, 2-63, 60) and other commenters (Ex. 2-92, 2-97) that OSHA should require that employees and employee representatives participate in the formulation and implementation of lockout programs (compliance plans, procedures, persons to conduct inspections, education and training programs and materials). These commenters also stated that any comments by employee representatives should be incorporated into the training programs. One commenter (Ex. 2-63) stated, "The standard does not prescribe worker participation in program design and training which is essential to an effective program." Another commenter (Ex. 2-97) stated, "Procedures cannot be written in a vacuum and must be accepted by employees, training must be appropriate and up-to-date for the situation." Finally, one commenter (Ex. 2-97) stated, "An effective lockout program must provide for employee participation and their representatives in program design and training."

OSHA has determined that a specific provision dealing with employee participation in the development of the employer's lockout or tagout procedure is not necessary for the effective implementation of the Final Rule. For standards dealing with exposure to toxic substances and harmful physical agents under section 6(b)(5) of the OSH Act, section 8(c)(3) of the Act spells out specific requirements for employee involvement in compliance activity. In particular, it requires that employees or their representatives have the opportunity to observe air monitoring and to have access to monitoring records. By contrast, there is no such specific statutory mandate for the

present standard. Although OSHA agrees that active employee involvement may enhance understanding and cooperation, the Agency believes that it would be inappropriate to require such involvement in this standard. The standard sets out the procedures and steps which the employer must take to establish and implement an effective procedure for controlling hazardous energy, and under the OSH Act, it is the employer who is responsible for complying with the standard.

3. Should OSHA change the scope and application statements of this standard in this Final Rule to cover construction, maritime, agriculture, electric utility, and oil and gas well drilling industries?

In the Notice of Proposed Rulemaking for the standard on the control of hazardous energy sources (Lockout/Tagout) (53 FR 15496, 29 April 1988), OSHA proposed exempting the construction, maritime and agricultural industries. In the preamble of the proposed rule, OSHA explained that the exemption of these industries was based upon their unique situations and work practices which would unduly complicate the development of a generic energy control standard for general industry. For example, the longshoring and the construction industries are generally characterized by casual (short term) employment which may last just until the project for which the employees were hired is completed. The project may involve the erection of a single building or the loading or unloading of a single vessel. Even on longer duration construction projects, the various tasks, such as steel erection or brick laying, are usually of relatively short duration. One commenter (Ex. 2-80), in discussing the need for regulation of the construction industry, pointed out the difficulty of providing adequate training of a transient workforce. Likewise, the agricultural industries can be characterized as ones which have more rapidly changing employment. For example, agricultural harvesting (and its employment of migrant workers) and the use of harvesting machines are limited to those times when crops are ready to be harvested.

Of additional concern in the imposition of regulations in the construction industry is the uniqueness of the earthmoving equipment, such as lattice boom mobile cranes, front-end loaders, bulldozers, scrappers and dump trucks. As opposed to maintenance on automobiles, buses and over-the-road trucks where removal of the ignition key usually ensures that the engine can not be started and the vehicle may be worked upon, some of the maintenance of the above mentioned earth moving equipment involves the positioning of components, such as buckets, blades and machine body parts, which present extraordinary hazards to maintenance or servicing personnel. These hazards and the means to minimize the potential for injury to employees involve additional considerations, which were not adequately addressed during the course of the rulemaking proceeding.

Because of the unique nature of these industries, their respective workforces and working conditions, OSHA believes that this Final Rule might need considerable modification in order to provide optimal protection to employees. In particular, OSHA is concerned with the effectiveness of the basic approach of this standard when applied to a workforce which is highly transient. The energy control procedure may vary widely from one workplace to another, and an employee in construction, for example, may find him/herself in several workplaces during the course of a single year. Similarly, the Agency will evaluate means by which the training requirements of this standard could be modified to reflect these conditions.

The Agency currently intends to consult with the Advisory Committee for Construction Safety and Health (ACCSH) on a proposed lockout-tagout standard for construction under section 107 of the Construction Work Hours and Safety Standards Act (Construction Safety Act), 40 U.S.C. 333. In addition, for the maritime industry, OSHA intends to present these matters to the Shipyard Employment Standards Advisory Committee (SESAC) for consideration as part of that Committee's review of shipyard standards in part 1915.

OSHA has determined that the Final Rule will cover General Industry, but will not be expanded to cover construction, maritime and agriculture at this time. The Agency has inadequate information at this time on both the hazards of lockout or tagout and the appropriateness of this standard's approach in those industry sectors. However, the Agency will continue to review information on these sectors and will evaluate the need to initiate further rulemaking and will consider whether this Final Rule, or an appropriate modification of same, should be used as the basis for a proposal for construction, maritime and agriculture.

There are several commenters (Ex. 2-27, 2-49, 2-57, 2-76, 2-79, 2-99, 2-106, 60), who were opposed to exempting any industry. Their concern was that the hazards associated with failure to lockout during the maintenance or servicing of machines or equipment were not restricted to a single industry or group of industries. It is their contention that this standard should have universal application. On the other side of the question, there was one commenter (Ex. 2-58) who agreed with the exclusion of these industries.

It should be noted that OSHA's electrical standards for construction (29 CFR part 1926, subpart K), which were revised on July 11, 1986 (51 FR 25318), currently contain various requirements for deactivating equipment, deenergizing electrical circuits, and limiting employee access to energized parts in construction work (e.g., §§ 1926.403(j), 1926.416, 1926.417). Similarly, OSHA's shipyard and marine terminal standards (29 CFR parts 1915 and 1917, respectively) include many provisions which address deenergization of equipment during servicing of equipment on vessels and in marine terminals (e.g., §§ 1915.162-.165, 1915.181, 1917.48(i), 1917.151(b).

Based on its experience in regulating construction and maritime employment, OSHA believes that a generic energy control standard would likely be applied quite differently in these areas than in general industry. Further, the interrelationship between a generic rule and the specific provisions currently applicable to these industry sectors must be considered. In its consultations with its advisory committee on construction and shipyard employment, OSHA will seek guidance on whether a generic rule would be appropriate for these industries; on what areas in which such a rule should differ from the general industry standard being issued today; and on the reasons for any such differences.

OSHA is no less concerned with the safety of these other employees. However, delaying the promulgation of this generic, general industry standard to examine all the unique aspects of these other industries would further delay the promulgation of this standard. There were five commenters (Ex. 2-22, 2-26, 2-45, 2-52 and 2-81) who recommended the exclusion of the natural gas transmission industry from the scope of this standard. Their contention was that OSHA would be preempted under section (4)(b)(1) of the Act from enforcement of this standard since the U.S. Department of Transportation has regulations affecting the gas transmission industry. Section (4)(b)(1) of the Act states:

> Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies and State agencies, acting under section 274 of the

Atomic Energy Act of 1954, as amended (42 U.S.C. 2021), exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

OSHA recognizes the possibility that its lockout or tagout standard may be preempted under section 4(b)(1) of the OSH Act by other Federal agency actions, such as regulations issued by the Department of Transportation's Division of Pipeline Safety. Section 4 (b)(1) provides that when another Federal agency exercises statutory authority over working conditions, that exercise of authority will preempt OSHA from covering those same working conditions. However, OSHA declines to incorporate a specific provision on preemption into this standard for two reasons: first, whether or not preemption takes place for a given working condition is a matter of law, to be evaluated in a case-by-case determination. Second, even in the event that preemption takes place, if the preempting agency were to choose to revoke its regulations or other exercise of authority, there would no longer be any preemption. Inclusion of a preemption provision by OSHA in a particular safety or health standard would inappropriately prevent OSHA from asserting its authority under the OSH Act in that situation.

There were five commenters (Ex. 2–21, 2–36, 2–40, 2–46 and 2–50–20), who discussed the application of this standard to the petroleum industry. Four of those commenters (Ex. 2–21, 2–36, 2–40 and 2–46) stated that OSHA should not try to "force fit" a machinery standard to process systems and piping networks; that OSHA should not expand the scope of the consensus standard; and that, if necessary, OSHA should develop a separate standard for process piping. (There was universal agreement on the part of these industry commenters that this standard did properly apply to the machinery elements of the process piping systems.) On the other hand, one commenter (Ex. 2–50) spoke out in favor of this OSHA standard to piping systems.

There were two commenters from the petroleum industry (Ex. 2–21 and 2–46) and one commenter from the chemical industry (Ex. 2–59) who objected to the use of a written lockout or tagout procedure as specified in the proposed Standard. These commenters stated that they use a work permit or work authorization system. The safe work permit checklist enclosed with one comment (Ex. 2–59) has provisions for the use of blinds and disconnecting pipes, and for extensive post isolating cleaning and testing. At the Houston segment of the hearing, the representative of the American Petroleum Institute acknowledged that the work authorization system was not inconsistent with the procedures set forth in the proposal. (Tr. p. H64). (OSHA agrees that a work permit checklist system or work authorization system could serve as the required written procedure as long as it meets the criteria for a procedure spelled out in this Final Rule.)

In their comments to the record, the American Petroleum Institute (API) restated their view that the lockout/tagout rule was not designed to regulate piping networks and process systems (Ex. 2–36). OSHA recognizes that the energy sources and control methods used in process hazards management are often quite different from those encountered with machinery and mechanical equipment. However, the Agency considers the basic approach of this standard to be appropriate for the control of all hazardous energy sources, including those discussed by API. Indeed, many, if not all, of the elements covered in the standard are addressed by the "work authorization procedures" commonly used throughout the petroleum and chemical industries. These procedures, which focus upon the issuance of work permits or permits for safe entry into piping systems, were acknowledged at the hearings to be consistent with the procedures set forth in the proposed rule. The primary area which warrants further explanation involves the different means used to isolate the energy in piping and process systems, and how they relate to the lockout or tagout requirements of this standard.

According to one commenter (Ex. 20), the procedural steps required for safe performance of process system maintenance are: (1) Deactivation, (2) removing contents, (3) isolation, (4) decontamination, (5) restraining, (6) verification, (7) control and (8) communication. In contrast, this standard sets forth five steps for lockout or tagout: (1) Equipment shutdown, (2) isolation, (3) lockout or tagout application, (4) stored energy restrictions, and (5) verification. However, these five steps encompass all elements of process system deenergization as well. For example, deactivation of a process system is analogous to equipment shutdown. Similarly, removing the contents of the piping system and isolation of the energy source can be compared to isolation and lockout or tagout of a machine or equipment, and decontamination and restraining in piping systems is essentially the same as restraining or minimizing the stored energy of machines and equipment. Finally, verification of the success of prior steps of a piping system isolation is the same as verification of proper implementation of the energy control program. OSHA acknowledges that when there are additional steps specific to the preparation for maintenance of piping systems, these steps would also need to be included in an employer's energy control program.

Based upon the foregoing comparison, OSHA believes that the imposition of the requirements of this standard (particularly the need for a standardized procedure) is not a "force fit" but the logical "tailoring" of the steps to a different type of equipment. Based upon the generic nature of this standard, OSHA recognizes that some modifications or "tailoring" of the requirements of this standard may be necessary, but the basic procedural provisions of the standard are designed to be used throughout general industry, in a wide range of applications.

Two commenters (Ex. 2–21 and 57) pointed out that some of the items listed in the definition of energy isolating devices (notably the blank flange and bolted slip blind) can require at least as much effort to remove as locks. These commenters pointed out that removal of these devices, when they are properly bolted in place, requires wrenches to disassemble the nuts and bolts holding the blank flange or blind. The use of these wrenches is comparable to using bolt cutters to remove a lock. Although the wrenches used for removing the nuts and bolts from the flanges may be more readily available with a piping system than a pair of bolt cutters in the average workplace, the time to remove the nuts and bolts would surpass the time to remove a lock. OSHA believes that this type of bolted system will provide comparable security against the release of hazardous energy in the system, even though a "lock" is not used. Based upon the above rationale, OSHA will consider bolted blank flanges or slip blinds to be an acceptable type of lockout/tagout device. As with all devices, these bolted systems must be used as part of a standardized, documented procedure, and they must meet the other requirements of the standard for lockout or tagout devices (that is, they must be durable, standardized, substantial and identifiable.)

If bolted flanges or slip blinds are used, a means must be devised so that each authorized employee can be identified as a participant in the project when he/she is working on it. For example, individual identification can be achieved by each authorized

employee hanging his/her tag on the blank flange or the slip blind when he/she starts work and removing his/her tag when he/she stops work. The tag in this case would supplement the locking mechanism of the bolts on the flanges or slip blinds.

The applicable consensus standard (ANSI Z244.1)(Ex. 9) has been reviewed for its applicability to process systems. It is clear from this review that this consensus standard was intended to apply to machines, equipment and processes. The definition of energy isolating device contains examples which include slip blinds, blank flanges, line valves and similar devices. These are devices used for energy isolation in piping systems.

OSHA believes that the employees working on the piping portions of processes deserve no less protection then when those same employees work on the mechanical components of the same systems. The advantage of writing this OSHA standard in performance language is to allow flexibility of compliance for all systems in which hazardous energy is or may be present. OSHA has used this approach to the formulation of this standard because of the wide range of energy control situations encountered throughout general industry.

OSHA also proposed to exclude from coverage of this standard certain installations under the exclusive control of electric utilities, as well as oil and gas well drilling operations. These industrial sectors were proposed to be exempted from this standard because lockout will be uniquely addressed for these industries in other proposed standards. In both cases, OSHA is actively working on projects to cover the special safety needs of these industries. (See 54 FR 4974, January 31, 1989 for the Proposed Standard on Electric Power Generation, Transmission, and Distribution.)

4. Should OSHA state the requirements of this final standard in performance language?

There were two commenters (Ex. 2–27, 2–29, and 2–91) who objected to the use of performance language in the proposed standard. Their objections were based upon the fact that, without specific requirements, employers would be allowed too much discretion in the means or methods that they utilize in complying with the standard.

There were 11 commenters (2–31, 2–34, 2–36, 2–37, 2–38, 2–46, 2–55, 2–57, 2–59, 2–62, 2–69, and 2–87) who favored the use of performance language in the standard. These commenters pointed out that the standard covers a vast segment of industry (both in size and type of companies) and type of operations. It is their contention that the use of performance language allows a degree of latitude to employers to "tailor" the required procedures, training requirements, and inspection parameters of the standard to fit the individual conditions present in their workplaces.

OSHA concurs with those commenters who stressed the need for flexibility in the standard. For example, the detail into which a procedure may have to go may vary depending upon the type of power the machine or equipment may utilize or the means used to isolate or block the machine or equipment from the source of power. The amount of detail in a procedure for shutting down a simple conveyor with a signal source of power, and single feed and discharge points, could be much less than the procedure for shutting down a long assembly line conveyor with multiple feed and discharge points, one which has many employees working about the conveyor. The use of multiple sources of power applied to the machine or equipment at multiple points would necessarily cause the complexity of the procedure to be enhanced.

Finally, the OSH Act, in discussing the promulgation of standards, states in the second sentence of section 6(b)(5), "Whenever practical, the standard promulgated shall be expressed in terms of objective criteria and of the performance desired."

Based upon the foregoing, OSHA has decided to retain the performance language in this final standard.

VI. Summary of Explanation of the Final Standard

There were 108 comments and 64 exhibits placed in the record of the Proposed Standard for the Control of Hazardous Energy Sources (Lockout/Tagout) (53 FR 15496, April 29, 1988) and 16 parties participated in the public hearing. There was general agreement on the need for a comprehensive standard (Exhibits (Exs.) 2–1, 2–3, 2–4, 2–5, 2–8, 2–9, 2–12, 2–13, 2–21, 2–27, 2–29, 2–34, 2–36, 2–38, 2–39, 2–40, 2–42, 2–50, 2–52, 2–53, 2–55, 2–59, 2–64, 2–69, 2–70, 2–72, 2–73, 2–74, 2–75, 2–77, 2–78, 2–79, 2–80, 2–85, 2–87, 2–91, 2–95, 2–98, 2–100, 2–105, 2–106) with the major discussion centering around the form and the content that the Final Rules should take.

As previously discussed (see section entitled "Major Issues" above) OSHA has determined that the use of lockout for the control of hazardous energy is the more positive means of ensuring employee safety. The fuse of tagout, in lieu of lockout, requires the addition of certain elements of the program and the reinforcement of others to provide full employee protection.

This standard requires the adoption and utilization of standardized procedures and the implementation of safe work practices for the control of potentially hazardous energy during servicing and maintenance activities. It also requires the training of employees in the use of these practices and procedures. An Appendix is provided to serve as an aid in complying with the requirements of this section.

In paragraph (a), OSHA defines the scope, application and purpose of this Standard for the control of hazardous energy (lockout or tagout). The standard covers servicing and maintenance in general industry where the unexpected energization or start-up of machines or equipment or the release of stored energy could cause injury to employees. This Final Rule does not contain specifications which must be followed in all circumstances, but, rather, provides flexibility for each employer to develop a program and procedure which meets the needs of the particular workplace and the particular types of machines and equipment being maintained or serviced.

In their post-hearing comment, (Ex. 60) the AFL–CIO suggest adding the word "processes" to the words "machinery" and "equipment," to clarify that the standard is intended to cover piping systems as well as machinery and equipment. As discussed earlier, OSHA agrees that processes are covered by the standard, although the Agency felt that the use of the term "equipment" in the proposal was broad enough to cover all types of equipment, including process equipment. Further, had process and piping equipment not been within the scope of the standard, it would have been unnecessary to include a separate provision for "hot tap" operations, which are performed almost exclusively on process and piping equipment. However, in response to the comments, and as discussed elsewhere in this preamble, OSHA has revised several of the proposed provisions in the standard to refer directly to piping and process hazards and some of the unique aspects of controlling those hazards in the context of this generic rule. For example, many servicing operations involving process equipment utilize blinds and blank flanges as means of controlling hazardous energy in the process system. These blinds and flanges can be bolted in place, a method of securing which does not involve an actual lock, but which would be of comparable or greater difficulty to defeat either intentionally or inadvertently. OSHA believes that the bolting of blinds and flanges should be considered to be a "locking device" for the purposes of the standard, and has modified its proposed definition to reflect this determination. Since the standard requires locking devices to identify the person that affixes them, the employer will need to use a supplemental tagout device on the bolted blinds and flanges to meet this requirement.

For the reasons discussed in the section entitled, "Major Issues", above, OSHA has determined that the present rulemaking effort should be limited in scope to general industry. Development of appropriate requirements for the control of hazardous energy procedures for construction, maritime, and agricultural employments will be considered for future rulemaking proceedings.

Secondly, OSHA has determined that certain installations under the exclusive control of electric utilities, as defined in paragraph (a)(1)(ii)(B), are not to be covered by this rule. These installations are intended to be covered separately by a new section, § 1910.269, "Electric Power Generation, Transmission and Distribution," which OSHA proposed on Junuary 31, 1988 (54 FR 4974). Because of the nature of these electrical utility operations, § 1910.269 will tailor the key provisions of this standard on lockout or tagout to meet the special safety needs of that industry. However, non-utility employers and workplaces that are engaged in the activities of power generation, transmission and distribution *are* covered by this standard and are not within the intended scope of § 1910.269. Whether or not this suggested demarcation is reasonable is an issue which will be dealt with in that rulemaking proceeding.

In their post-hearing comment (Ex. 55), the Edison Electric Institute (EEI) contended that the forthcoming power generation standard should cover the servicing and maintenance of mechanical and hydraulic equipment in power plants. If such equipment is either an integral part of, or inextricably commingled with, power generation processes or equipment, OSHA agrees that the power generation standard will apply instead of the generic lockout/tagout standard.

Further, OSHA states in paragraph (a)(1)(ii)(C) that exposure to electrical hazards from work on, near, or with conductors or equipment in electric utilization installations which is covered by Subpart S of Part 1910 also are excluded from coverage by this standard. OSHA intends coverage for this work to be provided instead in a separate rulemaking on "Electrical Safety Work Practices," which was proposed on November 30, 1987 (52 FR 45530) (new §§ 1910.331 through 1910.335) as an amendment to Subpart S. Those proposed sections have their own provisions for dealing with lockout/tagout situations, and for controlling employee exposure to hazardous electrical energy with the use of electrical protective equipment. They are based largely on a national consensus standard, NFPA 70E—part II, "Electrical Safety Requirements for Employee Workplaces."

Similarly, paragraph (a)(1)(ii)(D) excludes oil and gas well drilling and servicing installations from coverage by this rule. These installations are intended to be covered separately by a new § 1910.290, Oil and Gas Well Drilling and Servicing. A proposed § 1910.290 was published on December 28, 1983 (48 FR 57202). The Agency is currently developing a revised proposal to reflect the information in the rulemaking record, which was submitted in response to the initial proposal. The hazards involving lockout or tagout that are unique to oil and gas well drilling and servicing will be given a complete evaluation during that rulemaking process and appropriate steps will be taken to control them.

One commenter (Ex. 2–54) recommended the exclusion of the machine manufacturing industry from this Final Rule. This commenter contended that the inclusion of the word "constructing" in the definition of "servicing or maintenance" would seriously endanger the ability of machine manufacturers to perform the initial construction, assembly and manufacture of machines.

During the assembly of equipment, it is normally not connected to any external power source, except when a temporary connection is made to effectuate adjustment, testing or try-out. The nature of machine manufacturing normally only requires the connection to an external power source to move parts in order to allow for the construction. Once the system has been completely assembled, it is necessary to do final testing or try-out of the system. Energization of the entire system is generally necessary to accomplish the testing. The system is then connected to external power sources and the testing undertaken. If the tests are unsuccessful or further assembly work is needed, the equipment should be disconnected from the external power source and then the additional work conducted. It is during the time when the equipment is being alternately energized and deenergized that the energy control means are particularly significant.

OSHA believes that disconnection of a machine or equipment from external power sources, as with cord and plug connected equipment, is a satisfactory method of isolating the equipment from the source of energy. OSHA also recognizes that testing with the power on is often necessary to ensure the proper assembly and functioning of all components. OSHA believes that workers "constructing" machinery and equipment need the same safeguards as other emplolyees doing other servicing on maintenance operations. OSHA is, however, providing specific requirements in paragraph (f)(1) of this Final Rule for the safeguarding of employees during operations which require the alternate energization and deenergization of machines and equipment for testing and trouble shooting.

One commenter (Ex. 2–35) recommended that maintenance of medical equipment be excluded from this standard. This recommendation was predicated on the fact that maintenance and servicing of medical equipment is already covered by national consensus standards, that technical persons working on state-of-the-art medical equipment are highly trained professionals and that some equipment must be serviced while units are energized.

OSHA believes that national consensus standards, in and of themselves, do not ensure a safe and healthful workplace since they are not enforceable regulations. Compliance with specific provisions of such standards is voluntary except when OSHA incorporates then into its regulations. In addition, as previously discussed in this preamble even if the servicing employeee is highly trained, his/her safety during the servicing operation may well be dependent on the actions of persons who are not as well trained. Other employees, upon finding a machine or equipment not operating, may attempt to start the machines, not realizing that they may be subjecting themselves or others to an increased risk of injury.

In paragraph (a)(2)(i), the Final Rule states that the standard applies to servicing or maintenance of machines or equipment. These activities are defined in paragraph (b) to include activities such as constructing, installing, setting up, adjusting, inspecting, maintaining, repairing and servicing machines and equipment. These activities generally require the stoppage of the machine or equipment and the resulting

discontinuance of the production process. It is during these activities that the machine or equipment must be isolated from the energy source and the energy isolating device disabled. It is also during these activities that employees are exposed to the unexpected energization, startup or release of stored energy against which the control procedures established in this standard are designed to provide protection.

Proper accomplishment of most servicing requires that the machine or equipment be shut down or turned off. However, simply shutting down the machine or equipment has not proven to prevent accidents when there is an unexpected energization or start up of the machine or equipment or the release of stored energy. The control of this hazardous energy is accomplished through the use of a standardized procedure which requires the shutting off of the machine or equipment, locating the energy isolating device and isolating the machine or equipment from the energy source, locking or tagging out the energy isolating device, reducing or eliminating stored or residual energy and then verifying the effectiveness of the energy isolation.

There was one commenter (Ex. 2–80) who suggested that this standard should apply before, during, and after servicing or maintenance is performed. The use of this langauge could be interpreted as meaning the standard should apply at all times since before and after do not denote a beginning or an end. OSHA believes that the steps required by this standard are considered part of the servicing activity, regardless of whether they take place before or after the specific work on the equipment has been performed. Based on this interpretation, the final standard requires the control of hazardous energy only during servicing or maintenance is being conducted.

There are some activities which are properly classified as servicing or maintenance but which are often performed during normal production operations. These activities include lubricating, cleaning, unjamming, and making minor adjustments and simple tool changes. In the proposed standard, OSHA suggested excluding these operations (paragraph (a)(2)(iii) "when it is necessary to perform the activity with the machine energized and if the activity is performed using alternative measures which the employer can demonstrate are equally effective."

Two commenters (Ex. 2–44 and 2–80) stated that this exclusion was too broad and that there is difficulty in distinguishing between normal production operations and servicing or maintenance.

As discussed earlier, OSHA recognizes that machines and equipment present many hazards during their usage during normal production operations. These production hazards are addressed by the machine guarding standards, § 1910.212 (general machine guarding standard) and § 1910.219 (guarding power transmission apparatus). This standard is not intended to deal with these same hazards. However, if a servicing type activity happens to take place during production, such as unjamming the production equipment, the employee performing the servicing may be subjected to hazards which are not encountered as part of the production operation itself. These hazards are manifested when the employee must either remove or bypass guards or other safety devices, when the employee is required to place any part of his or her body into the point of operation of the machine or equipment, or where an associated danger zone exists during a machine operating cycle. In those circumstances, when there is potential for unexpected activation or energy release and the machine or equipment can be deenergized to perform the servicing, the standard requires that it be deenergized and be locked out or tagged out in accordance with the procedure required by this standard.

As was discussed in the preamble to the proposal, OSHA recognizes that some servicing operations must be performed with the power on; in these situations, it would not make sense to require lockout or tagout, which apply to deenergized equipment. The proposal contained a requirement that when servicing or maintenance must be performed with the equipment energized, the employer must use an alternative procedure which provides, in the language of the ANSI standard, "effective protection." Paragraph 6.8 of the ANSI Z244.1–1982 (Ex. 9) states in part:

> In the case of required minor adjustments where this (deenergization) is not feasible, or in the case of normal production operations, these activities shall be accomplished under the protection of specially designed control circuits, control equipment, and operating procedures, that provide proven effective protection for the affected personnel.

The proposed provision attracted considerable comment, particularly from the union participants, many of whom felt that it provided a "loophole" in the standard. OSHA believes that much of this concern was based on a fundamental misunderstanding of what this provision was intended to accomplish. For example, Mary Twedt, of the United Food and Commercial Workers (UFCW), (Tr. p. W1–183–1900) testified about a serious injury that she had incurred while clearing a jam in a bacon slicing machine. She indicated that she had switched the machine off, but that a co-worker had inadvertently reactivated it while her hand was in the machine. However, there was no indication that it was *necessary* to perform that unjamming operation with the power on. (In fact, since Ms. Twedt did turn the machine's power off to clear the jam, OSHA assumes that it was *not* necessary to have the equipment energized at that time). Further, if it *was* necessary to keep the energy on, the proposal would have required the employer to use an alternative procedure to lockout or tagout which would provide protection.

In the testimony at the Houston hearing, the UAW contended that the "exemption" for normal production operations was too broadly drawn, and that it would be a "loophole" in the standard. Representatives of the UAW testified that they felt that the provision was unnecessary. Their reasoning essentially was that if alternative methods were used to keep the employee out of the danger zone, there was nothing for the standard to cover, since the employee would not be exposed to the hazard. (Tr. p. H290–291). OSHA agrees in principle with this statement, but believes that the standard needs to cover these situations as well in order to provide comprehensive treatment of the hazards. The Agency also agrees that the proposed provision was not clear enough in indicating the types of operations which were covered by the standard, the types of operations which would not be covered by the standard, and the criteria to be applied to each situation. Therefore, the Agency has revised this provision in the Final Rule to deal with these problems.

In the Final Rule, OSHA is clarifying the intent behind the alternative provision for servicing or maintenance which takes place during normal production operations. The general rule is that servicing or maintenance, as defined in paragraph (b), must be performed under lockout or tagout in accordance with a written procedure established under this standard. Minor tool adjustments and changes or other minor servicing activities performed during normal production operations, are not covered by lockout or tagout requirements if the activities are routine, repetitive and integral to the production operation, provided that there is an alternative means being used for employee protection in lieu of lockout or tagout which will provide effective protection to employees.

OSHA emphasizes that this standard is not intended to cover the types of minor adjustments and other activities which are inherent in the production process. The machine guarding standards in subpart O cover these types of operations. The proposed rule included an exception for these types of operations, but OSHA has determined that there were two significant problems with the exception as proposed. First, the Agency believes that the provision was too broad as to the types of servicing or maintenance which would be excluded from the coverage of this standard. Proposed paragraph (a)(2)(iii) used the phrase "servicing or maintenance which takes place during normal production operations, such as lubricating, cleaning, and making minor adjustments and simple tool changes" to describe activities which would not be covered by this standard. OSHA's intention was to exclude from coverage those actions which would otherwise fit within the definition of "servicing or maintenance," but which are actually routine, repetitive actions which are integral to the operation of the equipment for production, and which are necessary to allow production to proceed without interruption. However, the language of the proposal could have been read more broadly, to exclude from coverage certain servicing operations which should not be considered to be part of "normal" production, and which should be performed with the equipment deenergized. OSHA has revised the proposed exclusion to clarify the limitations of the standard, and to provide more guidance as to the types of servicing activities which must be performed under lockout or tagout. The second problem with the proposed exclusion was that it would have required the employer to demonstrate that it was necessary to perform the operation with the machine or equipment energized. The record reflects much concern about this provision, particularly with regard to the criteria to be applied in determining the necessity of having the equipment energized. OSHA emphasizes that this exclusion was intended to cover the types of routine, repetitive, minor adjustments which are integral to and necessary for the production process. The revised language in the Final Rule sets forth the criteria to be applied in determining whether a given servicing operation is covered by this standard, or whether it is to be considered a part of normal production operations, which require alternative means of protection.

Normal production operations, together with these minor servicing aspects which are also excluded from lockout or tagout coverage, continue to be covered by the machine guarding requirements of subpart O of part 1910. OSHA has provided several examples of the types of activities taking place during production which the Agency would consider to require lockout or tagout, as well as examples of those which would not. It must be emphasized that exclusion from lockout or tagout does not mean that the employer can avoid providing protection. As the exclusion itself makes clear, the employer must provide alternative measures which he/she can demonstrate will provide effective protection. This will generally involve compliance with OSHA's machine guarding requirements throughout the production process.

In evaluating servicing performed during normal production operations, the first question to be asked is whether employees must bypass guards or otherwise expose themselves to the potential unexpected release of hazardous energy. If no such exposure will occur, either because of the method in which the work is performed or because special tools, techniques, or other additional protection is provided, lockout or tagout is not required. If there is such exposure, the lockout or tagout requirements of this standard apply. However, if the servicing operation is routine, repetitive and must be performed as part of the production process, it is obvious that lockout or tagout cannot be performed, because these procedures would prevent the machine from economically being used in production. OSHA will continue to treat these operations as being covered by the general machine guarding requirements of subpart D. The employer must provide appropriate guarding to protect employees from points of operation, nip points, and other areas of the equipment where the employees might be endangered. The use of alternative protective methods to keep employees' bodies out of danger zones, such as specially designed servicing tools, remote oilers, and the like, would meet this requirement.

The Final Rule, as did the proposal, also recognizes that there are some servicing operations in industry which require the equipment to be energized at least at some point during the servicing, for the purpose of testing or positioning the machinery or equipment or the components thereof. Where the energization is limited to those times, and is not shown to be necessary for the entire servicing operation, such servicing will generally be covered by the lockout or tagout requirements of this standard, but with the implementation of the special procedures set forth in paragraph (f)(1) for the temporary removal of lockout or tagout only when the machine or equipment must be energized.

The concept behind both the proposed and final provisions on normal production operations was taken from the ANSI standard, which attempted to address situations in which it was necessary to keep equipment energized during servicing. It was clear to the ANSI committee, as it was and is to OSHA, that neither lockout nor tagout is possible in a situation when the equipment cannot be deenergized, because these efforts involve assurances that deenergization has been achieved and that the proper procedures and verifications of deenergization have been carried out. However, both ANSI and OSHA believe that even if lockout or tagout cannot be done, the employer must provide alternative procedures to lockout/tagout which will protect the employees doing the servicing under those conditions.

There are some situations in which lockout or tagout may not be effective or appropriate, and the standard does not require the use of lockout or tagout in these circumstances. In paragraph (a)(2)(iii), OSHA lists those situations where lockout or tagout provisions do not apply.

In the proposed paragraph (a)(2)(ii)(A), OSHA specified that the standard would not apply when employees are working on cord and plug type electrical equipment for which exposure to the hazards of unexpected energization, start-up, or release of stored energy of the equipment is effectively controlled by other measures. This exclusion would encompass the many varieties of portable hand tools that are found in the workplace, as well as cord and plug equipment which is intended for use at a fixed location.

There were 13 commenters (Ex. 2-14, 2-20, 2-27, 2-34, 2-38, 2-40, 2-44, 2-63, 2-76, 2-29, 2-80, 2-97 and 2-105) on the issue of the proposed exemption for cord and plug connected equipment. Four of these commenters (Ex. 2-44, 2-63, 2-79 and 2-97) stated that the requirements of this standard should apply to all situations (i.e., OSHA should not allow an exemption for cord and plug connected equipment). Two commenters (Ex 2-27 and 2-76) suggested that the standard should apply when the plug is not near the employee or if it could be plugged in without the employee's knowledge. Two commenters (Ex. 2-38 and 2-40) recommended expanding the scope of this exception to all small machinery or to those pieces of equipment for which the energy isolating device is in the control of the employee performing the maintenance. One commenter (Ex. 2-39) concurred with the proposal as written while one commenter (Ex. 2-14) suggested spelling out the alternate measures which were necessary to eliminate the requirement for locking out the energy isolating device. One commenter (Ex. 2-20) concurred with the exception as long as the employee who is doing the maintenance removes the plug and that employee does so only to do the maintenance.

Based upon the arguments put forward by each of the above commenters, OSHA has decided that the lockout/tagout requirements of the standard will not apply to cord and plug connected equipment if the equipment is unplugged and the plug is in the exclusive control of the employee who is performing the servicing or maintenance of that equipment. Because this employee would control the plug, he/she would be able to prevent the equipment from becoming reenergized during the servicing operation.

Paragraph (a)(2)(ii)(B) proposed that the use of lockout/tagout procedures would not apply to "hot tap" operations when continuity of service or process operation is essential, and complete shutdown of the system impractical, provided that documented procedures and special equipment are used by the employer which will provide proven effective protection for employees. This provision was intended by OSHA to address the petroleum industry's concern (Ex. 16) for the handling of "hot tap" operations commonly used in their facilities, although it might also address other similar operations.

The "hot tap" procedure is employed in repair, maintenance, and service activities, and involves the cutting and welding of equipment (pipelines, vessels or tanks) under pressure in order to install connections or appurtenances. It is commonly used to replace or add sections of pipeline without the interruption of service for air, gas, water, steam and petrochemical distribution systems. Special metal cutting and welding equipment and specific operating procedures are used to limit explosion hazards. The operation may be performed by in-house maintenance personnel or by outside contractors.

The use of "hot tap" procedures appears to avoid several safety risks which would otherwise arise in servicing equipment which is under pressure. First, process shutdowns and start-ups with equipment of this nature pose extreme hazards of explosions and fires due to the complexities and interrelationships among process components. For example, during start-up it is necessary to purge pipelines of air, water and/or inert gases before hydrocarbons are introduced. Malfunctions or operator errors during purging could easily create explosive mixtures in the equipment. In other instances, process shutdowns and start-ups can result in rapid condensation within the process equipment and may cause "water hammers," which are sudden pressure changes that can shake, vibrate and stress equipment to the extent that the pipeline breaks or connection leaks develop. Finally, a third class of hazard avoided is one created by the much higher level of worker activity required during a complete process shutdown or start-up. This may result in more extensive worker exposure to the hazards of the shutdown or start-up procedure, and in greater potential for injury than would be involved in performance of "hot tap"-type activities, in which fewer employees would be exposed.

The OSHA standard, as proposed, stipulated that hot tap operations would be exempt from the requirements of the standard if the employer could demonstrate that: (1) Continuity of service is essential; (2) shutdown of the system is impractical; and (3) documented procedures and special equipment are utilized which will provide effective protection for employees. In the preamble and the Appendix to the proposed rule, OSHA referred to the American Petroleum Institute's (API) publication, "Procedures for Welding or Hot Tapping on Equipment Containing Flammable," Publication 2201, Second Edition, November 1978, (Ex. 3-16). Reference to this document was intended to serve as an illustration of an acceptable procedure. It should be noted that the API procedure applies only to piping, vessels and tanks containing flammable liquids, gas or combustible material.

OSHA's intent in proposing this exception from the requirements of this standard was to allow, in certain cases, a particular type of work (the hot tap) in a limited number of cases (that is, when continuity of service is essential and shutdown is impractical) while providing for an acceptable level of safety for employees. Without this exception to the requirements of this standard, a hot tap operation could not be conducted since the standard would otherwise require machine or equipment shut down and lockout or tagout of energy isolating devices to perform servicing or maintenance.

There were eight commenters (Ex. 2-20, 2-21, 2-22, 2-27, 2-70, 2-76, 2-80 and 2-81) to this proposed requirement. One commenter (Ex. 2-20) suggested that the first two criteria listed above (that continuity of service is essential and shut down is impractical) are unnecessary and should be eliminated from the final rule. Three commenters (Ex. 2-21, 2-22 and 2-81) recommended eliminating the exception entirely. One commenter (Ex. 2-70) proposed the elimination of the need to use special tools. There were two commenters (Ex. 2-27 and 2-80) who encouraged OSHA to be more specific and to detail exact training requirements and work practices for workers involved in hot tap operations. Finally, one commenter (Ex. 2-76) expressed agreement with this concept as proposed.

OSHA believes that employees performing hot tap operations should have comparable protection to workers performing other servicing or maintenance of machines or equipment. OSHA also believes that these operations should be allowed to be conducted when certain limited conditions exist, such as when continuity of service is essential and system shut down is impractical. By specifying these limitations the employer would be prohibited from conducting these operations simply as an expedient. The need for continuity of service would be illustrated by the pipeline containing a petroleum product where stopping the flow of the product and draining the pipeline could introduce an additional danger to employees since the concentration of the gaseous product remaining in the pipe, when mixed with air, could fall within the explosive range of the product, thereby threatening an employee with serious injury if that employee would attempt to weld on the pipe. In this case, shut down may not be practical because shutting down the system may prove more hazardous than allowing the continued operation of the system while the hot tap operation is being conducted. Another example would be when a large storage tank with a hazardous substance is punctured or otherwise penetrated. There is obviously little or no time available to continue the service (store the substance) and shut down the system (drain the tank). In this case, the hot tap operation could be safely and

properly conducted if a documented procedure and the required equipment are used so that they provide effective protection for employees.

In paragraph (a)(3), OSHA sets forth the manner in which the employer is required to protect employees from injuries that could result from the unexpected energization or start up of machines or equipment, or the release of stored energy, when they are engaged in servicing or maintenance activities. This standard requires the development of a program centered around the utilization of a standardized procedure and the training of employees in their role in the successful use of that procedure.

Paragraph (a)(3)(i) specifies that the control of hazardous energy be accomplished by the use of a standardized procedure for affixing the appropriate lockout or tagout devices to energy isolating devices and by otherwise disabling equipment. The steps to be followed by the employer to accomplish this goal are set forth in paragraphs (d)(1) through (d)(5).

In paragraph (a)(3)(ii), OSHA states that the intention of the standard is not to replace existing specific OSHA lockout and/or tagout provisions, but to supplement and support these provisions with the requirement for establishing a procedure and with the requirement for training employees in the energy control program. The following listing indicates a number of OSHA standards which currently impose lockout-related requirements:

Powered Industrial Trucks

1910.178(q)(5)(i)

Overhead and Gantry Cranes

1910.179(g)(5)(ii)
1910.179(g)(5)(iii)
1910.179(g)(5)(i)
1910.179(l)(2)(i) (b), (c), (d)

Derricks

1910.181(f)(2)(i)(c)
1910.181(f)(2)(i)(d)

Woodworking Machinery

1910.213(a)(10)
1910.213(b)(5)

Mechanical Power Presses

1910.217(b)(8)(i)
1910.217(d)(9)(iv)

Forging Machines

1910.218(a)(3)(iii)
1910.218(d)(2)
1910.218(e)(1)(iii)
1910.218(f)(2) (i), (ii)
1910.218(a)(3)(iv)
1910.218(e)(1)(ii)
1910.218(f)(1) (i), (ii), (iii)
1910.218(g)(3)

Forging Machines (continued)

1910.218(h)(2)
1910.261(i)(1)
1910.218(j)(1)
1910.218(h)(5)
1910.218(i)(2)

The standards listed above provide limited coverage of machinery, equipment and industries and do not address lockout or tagout issues or methodology in any detail. For example, none of the existing standards cover the need for a procedure or for more than one or two procedural steps pertaining to the actual application or release of energy control measures. The current provisions also do not address the basic requirements contained in the standard which are needed to support and coordinate the implementation of control measures such as the selection of hardware, communications, periodic inspections, and assignment of duties. Additionally, the need to document a procedure, or to train employees engaged in the relevant activities, is not explicitly required by any of the present regulations. A typical example of this limited coverage is found in the following provisions for mechanical power presses:

Section 1910.217(b)(8)(i). A main power disconnect switch capable of being locked only in the off position shall be provided with every press control.

Section 1910.217(d)(9)(iv). The employer shall provide and enforce the use of safety blocks for use whenever dies are being adjusted or repaired in the press.

A general review of these and other lockout and lockout related provisions in OSHA's § 6(a) standards would seem to indicate that the consensus groups which originally developed these standards had either of two primary concerns in mind. Those concerns involve the need either (1) to provide equipment with the physical means or capability to isolate energy sources during maintenance and repair activities; or (2) to make a choice of the control measures (locks or tags) which were to be provided and used on the specific machine, equipment or process covered by the standard.

The first category of provisions, while requiring the equipment to have the capability of being locked out, does not necessarily require that such control be accomplished. For example, § 1910.213(b)(5) states, "On each machine operated by electrical motors, positive means shall be provided for rendering such controls or devices inoperative while repairs or adjustments are being made to the machines they control." As another example, § 1910.218(e)(1)(ii) states, "Air hammers shall have a shutoff valve as required by paragraph (d)(2) of this section and shall be conveniently located and distinctly marked for ease of identification." These provisions are specific in nature as they apply to the machines and equipment regulated and are primarily design oriented. For the most part, they address the importance assigned to the proper installation of equipment with regard to the arrangement of electrical and mechanical components. They do not, however, address the use of these components directly, nor do they establish a procedure for assuring that they are, in fact, used. This standard supplements these provisions and does not conflict with their requirements. The equipment required by this category of current rules will be used as part of the servicing procedures set out in the Final Rule. For these reasons, OSHA did not propose any change in provisions in this category as they currently appear in part 1910. Provisions of similar content are:

1910.179(g)(5) (i), (ii), (iii)
1910.217(b)(8)(i)
1910.218(e)(1)(iii)
1910.218(j)(1)
1910.261(k)(2)(ii)
1910.263(l)(8)(iii)
1910.213(a)(10)
1910.218(a)(3)(iii)
1910.218(h)(2)
1910.252(c)(1)(i)
1910.262(c)(1)
1910.265(c)(26)(v)

The second category of provisions involves those which mandate the specific use of lockout, tagout or other energy control devices for certain machines, equipment or industries. The category addresses the application of locks, locks or tags, locks and tags, and in some cases the use of blocks, to control potentially hazardous energy.

An example of provisions used to specify the use of locks for a control measure is found in § 1910.179(l)(2)(i)(c) which states, "The main or emergency switch shall be open and locked in the open position." Provisions of similar content are sections:

1910.181(f)(2)(i)(c)
1910.218(f)(1)(i)
1910.218(h)(5)
1910.218(i)(2)
1910.262(n)(2)
1910.262(q)(2)
1910.263(l)(3)(iii)(b)
1910.218(d)(2)
1910.218(f)(2)(i)
1910.218(i)(1)
1910.261(b)(4)
1910.262(p)(1)

Section 1910.261(j)(4)(iii) which states: "When cleaning, inspecting, or other work requires that persons enter the beaters, all control devices shall be locked or tagged out, in accordance with paragraph (b)(4) of this section." Provisions of similar content are sections:

1910.261(g)(2)
1910.261(j)(5)(iii)
1910.261(g)(19)(iii)

An example of provisions used to specify the use of locks combined with tags is found in § 1910.261(g)(15)(i) which states: "Valves controlling lines leading into a digester shall be locked out and tagged. The keys to the locks shall be in the possession of a person or persons doing the inspecting or making repairs." A provision of similar content is found in § 1910.261(f)(6)(i).

An example of provisions used to specify the use of blocks to control hazardous energy is found in § 1910.217(d)(9)(iv) which states: "The employer shall provide and enforce the use of safety blocks for use whenever dies are being adjusted or repaired in the press." Provisions of similar content are sections:

1910.218(f)(2)(ii)
1910.218(a)(3)(iv)
1910.265(c)(13)
1910.218(f)(1)(iii)
1910.261(b)(4)

The groups of provisions found in this second category, and others similar to them covering potentially hazardous energy, are also not replaced by the final lockout or tagout standard. These provisions selectively require the use of the most effective devices for isolating and securing energy sources. This standard will supplement these other provisions in much the same way as with the first category in that it requires the establishment of procedures for energy controls, and the training of employees in these procedures.

In summary, this standard focuses primarily on procedures—procedures that are necessary to provide effective control when dealing with potentially hazardous energy sources. Where current standards require the use of specific measures, those standards are supplemented and not replaced by the procedures and training requirements of this Final Rule.

This standard is also intended to interact with any new or revised standards which may be promulgated in the future to address the use of specific control measures on an individual basis. Selection of the specific method of control, at that time, will reflect a thorough evaluation of the extent of exposure to the hazard; the risk of injury involving that particular machine, equipment, or industry, and the feasibility of applying a particular method of control. This standard requires that procedures be followed to implement the required control as part of a total package including training and education.

In paragraph (b), OSHA is adopting a number of definitions to clarify the meaning, intent and purpose of certain terms contained in this standard. In the proposed standard, all but five of the definitions were consistent with those published by the American National Standards Institute (ANSI) in their consensus standard, ANSI Z244.1–1982. The five definitions that were added covered the terms "energized," "setting up," "normal production operations," "hot tap," and "servicing or maintenance." In the Final Rule, OSHA has changed six of the proposed definitions, has added two definitions and deleted one.

The definitions of affected and authorized employees, as proposed, received considerable comment. As proposed, the definition of each was:

Affected employee. A person, other than the authorized employee, whose job includes activities covered by this standard as set forth in paragraph (a)(2) of this section.

Authorized employee. A qualified person to whom the authority and responsibility to perform a specific lockout and/or tagout assignment has been given by the employer.

Eight of the eleven commenters who discussed these definitions recommended either combining the two (Ex. 2–5, 2–28, 2–32 and 2–85) or revising them for clarity (Ex. 2–34, 2–74, 2–76 and 2–89). One commenter (Ex. 2–20) suggested changing the definitions to include supervisors while one commenter (Ex. 2–50) suggested changing "qualified" to "competent" based upon the dictionary definition of each of these terms. One commenter (Ex. 2–75) said that the definitions were satisfactory as stated.

Based upon the confusion which each of these definitions have created, OSHA is revising both definitions to identify each type or class of person. This differentiation is based upon their role in the control of energy (the action which they must either take or not take during the servicing or maintenance of machines or equipment) and the knowledge or information which they must possess regarding locking out or tagging out energy isolating devices.

OSHA has determined that the definitions of "authorized employee" and "affected employee" need to be clarified to reflect more accurately the person's involvement in the use of lockout or tagout. If an employee must utilize the energy control procedure, that employee is considered to be an "authorized employee." By contrast, an "affected employee" is one who does not perform the servicing or implement the energy control procedure, but whose responsibilities are performed in an area in which the energy control procedure is implemented and servicing operations are performed under that procedure. The affected employee does not need to know how to perform lockout or tagout, nor does that employee need to be trained in the detailed implementation of the energy control procedure. Rather, the affected employee need only be able to recognize when the energy control procedure is being implemented, to identify the locks or tags being used, and to understand the purpose of the procedure and the importance of not attempting to start up or use the equipment which has been locked out or tagged out. The definition of "affected employee" also recognizes that an affected person and an authorized person may be one and the same person when a machine operator or user must also perform servicing or maintenance on the machine or equipment. In this case, the employee must have the requisite knowledge of an authorized employee.

The proposed definition of "authorized employee" appeared to limit that term to a particular person who has responsibility for the overall implementation of an energy control procedure. Many comments indicated that this took protection away from individual employees who had responsibilities under the procedure but were not actually in charge of its full implementation (Ex. 2–32, 2–34, 2–40, 74, and 2–85). OSHA agrees that as long as an employee is involved in performing an element of servicing and maintenance which is covered by the energy control procedure, that employee should be considered an "authorized employee" for the purpose of this standard. This is particularly important in the context of the requirement in paragraph (d)(3) of the standard, which requires the authorized person to affix a personal lockout or tagout device on the energy isolating device as part of the energy control procedure. The revised definition assures that when a servicing task is performed by a team or group of employees, each employee who is directly exposed to the hazards of the servicing operation will have the responsibility to affix his/her personal lockout or tagout device before beginning the work and to remove it

BEST COPY AVAILABLE

when he/she completes the work. In addition, as discussed below, paragraph (c)(5)(ii)(D) of the Final Rule provides additional accountability by requiring such lockout and tagout devices to identify the authorized person responsible for applying them.

In the proposed standard, OSHA defined the term "energized" to refer to the connection of equipment to an energy source (mechanical, electrical, hydraulic, etc.) which has not been isolated. There was one commenter (Ex. 2–76) who recommended including language for stored energy.

Based upon an evaluation of the way which this term is used in the standard, OSHA has changed the definition to indicate that energized means connected to an energy source or containing residual or stored energy. OSHA has dropped the phrase "which has not been isolated" because connection to an energy source means that the machine or equipment has not been isolated.

In this final standard, OSHA has amended the proposed definition of "energy source" to eliminate the phrase, "that is capable of causing injury to employees." The definition becomes, in essence, that an energy source is a source of energy. If an energy source does not have the capability of causing injury to employees, it is not "hazardous energy" within the scope of this standard. As used in the standard, an energy source includes the means of transmission of the energy from its true source to the energy isolating device. Therefore, isolating a machine or equipment from an energy source means utilizing an energy isolating device to interrupt the flow of energy from the means of transmission of the energy to the machine or equipment.

The identification of "energy sources," as defined in this proposal, is complicated by three very important considerations: (1) Energy is always present in machinery, equipment or processes; (2) energy is not necessarily dangerous; and (3) danger is only present when energy may be released in quantities or at rates that would harm an employee. Generally speaking, however, potentially hazardous energy sources are defined as those that can cause injury to employees working in, on, or around machines or equipment.

The energy sources identified in this standard require a more detailed discussion. "Energy," as used in this document means mechanical motion; potential energy due to pressure, gravity, or springs; electrical energy; or thermal energy resulting from high or low temperature. Some energy sources can be turned on and off, some can be dissipated, some can be eliminated, and some can only be controlled. These concepts will be addressed throughout the discussion of energy control procedures in this Final Rule. The following brief analysis of energy sources may provide the reader with a better understanding of the provisions of this standard.

1. Mechanical motion can be linear translation or rotation, or it can produce work which, in turn, produces changes in temperature. This type of energy can be turned off or left on.

2. Potential energy can be due to pressure (above or below atmospheric) as in hydraulic, pneumatic, or vacuum systems, or it can be due to springs or gravity. Potential energy manifested as pressures or in springs can be dissipated or controlled; it cannot be turned off or on.

3. Electrical energy refers to generated electrical power or static electricity. In the case of generated electricity, the electrical power can be turned on or turned off. Static electricity cannot be turned off; it can only be dissipated or controlled.

4. Thermal energy is manifested by high or low temperature. This type of energy is the result of mechanical work, radiation, chemical reaction, or electrical resistance. It cannot be turned off or eliminated; however, it can be dissipated or controlled.

The definition for "normal production operations" noted that these were operations which enable the machine or equipment to perform its intended production functions. These functions would be carried out by employees with the machine or equipment energized.

There were two comments (Ex. 2–29 and 2–80) who discussed this definition. One commenter (Ex. 2–29) contended the minor repairs, adjustments and operations should be considered servicing and maintenance rather than normal production operations. The other commenter (Ex. 2–80) suggested that the language of the Final Rule more clearly differentiate between normal production operations and servicing and maintenance.

As evidenced throughout this rulemaking proceeding, the line between "normal production operations" and "servicing or maintenance which takes place *during* normal production operations" is not always evident. The coverage of these activities, in simplest terms, is as follows: Normal production operations are covered by the machine guarding requirements in subpart O of part 1910. If servicing or maintenance is performed during normal production operations without the removal or bypassing of the machine guarding required by subpart O, this standard does not apply. Servicing or maintenance which occurs during normal production operations is covered by this Final Rule only if employees must bypass guards or otherwise place part of their bodies into an area in which they are exposed to the unexpected energization or activation of the equipment. If the employee is not exposed in this manner, such servicing or maintenance during normal production is not covered by this Final Rule. OSHA believes that the following examples will illustrate the types of activities which will come within each set of requirements.

In a printing shop, when a printing press is being used to produce printed materials, there is often the need to make minor adjustments such as to correct for paper misalignment while the press is running. This is a part of the production process, and is subject to the machine guarding requirements. The use of remote control devices will keep the employees from reaching beyond the machine guards. In addition, the use of inch (or jog) devices will permit machine speed control for test purposes. By contrast, however, printing presses may jam, requiring the employee to bypass the machine guards in order to reach the area of the jam and clear it. Although the need to unjam the machine comes about during normal production operations, it is a servicing activity which involves employee exposure to unexpected activation of the machine or release of energy, and as such, is covered by this Final Rule.

In a machine shop, a milling machine machine operator must adjust the flow of coolant oil to parts being milled while the cutting tool is in operation. This operation, which is part of the normal production process for the machine, is covered by the machine guarding requirements. Guarding must be provided to keep the employee's body away from nip points and other points of operation. If it becomes necessary to adjust the movement of the long-bed milling machine worktable where the isolating hydraulic cut-off valve is not in exclusive control of the person making the adjustment, and this requires the employee to place any part of his/her body in an area which was otherwise required to be guarded, this Final Rule would apply. If this step is performed without the employee having to bypass the guarding or otherwise expose his/her body to the potential release of energy or the unexpected activation of the milling machine, this Final Rule would not apply.

An employee is operating a machine which applies and seals a clear plastic

---

sheet around a packaged product. There is a blade on the machine which cuts the plastic sheets, and this blade must be cleaned off periodically during the production process. Since the process must be stopped to clean off the blade, one could argue that this operation is more in the nature of servicing or maintenance than normal production; on the other hand, since it must be performed frequently during production, one might also argue that it was actually part of the production process. Because of the dovetailing of the requirements of this standard and the machine guarding requirements of subpart O, protection must be provided, regardless of whether the above operation is considered to be production or servicing. If it is production, the employee must be provided with guarding to protect him/her from the dangers of contacting the blade with part of his/her body; the cleaning would need to be done with special tools and procedures to provide the necessary protection. However, if it is servicing, and the employee is exposed to the point of operation which is otherwise required to be guarded, the lockout or tagout provisions of this standard would apply.

The definition of normal production operations has been simplified to state the normal production operations are the utilization of a machine or equipment to perform its intended production function. Anything that is done to prepare a machine or equipment to operate, such as setting up or changing the blade on a power saw, would not be included in the utilization of the machine or equipment and would be classified as servicing or maintenance rather than normal production operations. OSHA believes that this definition complements the definition of "servicing or maintenance" in this Final Rule. Further, these two definitions together help to provide a dividing line between the requirements of this standard and the safeguards already required for normal production operations by the general machine guarding standards in subpart O of part 1910 (§ 1910.212 and § 1910.219). Whereas the definition of servicing or maintenance includes those activities which require an employee to remove or bypass guards or other safety devices or to otherwise expose himself/herself to hazardous machine elements, the standards for machine guarding offer protection when the machine is being used in the manner in which it was designed and intended to be used, that is, when the machine or equipment is used to perform its intended production function.

OSHA has also amended the definition of setup to limit that activity to preparing a machine or equipment to perform its intended function. As proposed, setup involved placing a machine or equipment into an operational mode which could have included activities such as turning it on. Many types of machines and equipment can be turned on or started without doing what is commonly thought of and referred to as setup work.

The definition of lockout/tagout as proposed has been changed in the Final Rule to two separate definitions. This was done to clarify the fact that a lockout device, when properly applied, prevents operation of the energy isolating device whereas a tagout device indicates that the energy isolating device and the machine or equipment should not be operated.

OSHA has eliminated the definition of qualified person from this Final Rule. This was done because OSHA believes that this standard adequately specifies the type of training which is necessary and appropriate to prepare any person to perform the tasks involved in the employer's energy control program. The Final Rule requires that both authorized employees and affected employees be trained in and understand those things which are necessary for the employee to know in order to do the lockout or tagout safely. Paragraph (c)(7)(i)(A) requires that authorized employees receive training in the recognition of the applicable hazardous energy sources, the type and magnitude of the energy available in the workplace and in the procedure to be used for energy isolation and control. Additionally, paragraph (c)(7)(v) requires that, before the machine or equipment is turned off, the authorized employee knows the type and magnitude of the energy to be controlled, the hazards involved with such energy, and the procedure to be used for controlling the energy.

The development and documentation of energy control procedures is of little use unless the employer requires all authorized employees to utilize the procedures that have been provided whenever they are servicing or maintaining machines or equipment. In general, whenever lockout or tagout is used in accordance with this standard, each employee performing servicing or maintenance shall affix and remove, as necessary, an individual and identifiable lock or tag on the energy isolating device as part of the energy control procedure. To meet these requirements, paragraph (c)(1) requires the employer to ensure that hazardous energy control procedures have been implemented for all activities covered by this standard, and are being complied with by the employees. Methods for evaluating and maintaining the proper implementation of these procedures are provided in two other paragraphs of the standard: paragraph (c)(6), which addresses periodic inspection for observing employee compliance with the procedures; and paragraph (c)(7), which covers initial and periodic follow-up training to develop and maintain the knowledge and skills needed by employees for the safe application and removal of energy controls.

Paragraphs (c)(2) of this standard contains a discussion of the conditions under which either lockout or tagout may be utilized. OSHA makes a distinction between the method of controlling the energy (the type of energy control devices utilized) based primarily upon whether or not the energy isolating device was designed to accommodate a lockout device.

As discussed in the major issues section of this preamble, OSHA recognizes that there are many important elements of any energy control program, and that the choice of lockout versus tagout is just one of these elements. Further, OSHA also acknowledges that in isolation, the attachment of a lockout device to an energy isolating device, will provide greater protection against reactivation that an attachment of a tagout device. However, the issue to be resolved in this rulemaking is not the simple question of whether a lock is more protective than a tag. Rather, the Agency must address a series of related questions involving not only the effectiveness of lockout or tagout, but the feasibility and cost implications of requiring one method or the other in all energy control programs.

The record is replete with comments and testimony on the superiority of lockout to tagout as a means of securing energy isolating devices. However, there are also considerable data in the record on programs which use only tags and appear to be effective in doing so. In addition, whereas there is much information on equipment currently in place which has been designed to accept lockout devices, there is a dearth of data indicating the extent to which equipment across general industry would need to be retrofitted or modified to give it the capability to be locked out. There is little question that there is a significant hazard which needs to be addressed by an OSHA standard, but OSHA must regulate in the face of much conflicting evidence on the issues of feasibility and effectiveness. Under these circumstances, the Agency has

---

reached several conclusions. First, as a general rule, lockout must be implemented as part of the overall energy control program for equipment which is "capable of being locked out." The term "capable of being locked out" is defined in the standard. Equipment which is designed with a hasp or other attachment which can be locked, or which incorporates a locking mechanism, is obviously considered to be "capable of being locked out." However, other equipment without such a *designed-in* locking capability may still be considered "capable of being locked out," but only if lockout can be achieved without the need to dismantle, rebuild or replace the energy isolating device, or permanently alter its energy control capability. Second, for equipment which is capable of being locked out, OSHA recognizes that employers may, nonetheless, wish to implement a tagout program instead of lockout. OSHA will allow the use of tagout programs under these conditions only if the employer can demonstrate that the complete program will, when using tagout devices attached to the energy isolating devices, provide full employee protection. In most cases, in order for OSHA to consider a tagout program to be sufficiently protective, the elements of such a program will need to be very detailed and intensive, and will necessitate far more commitment and day-to-day vigilance to make it work than will a lockout program. This is necessary because a tag serves only as a warning and not as a positive restraint on hazardous energy. The Final Rule establishes criteria which OSHA will evaluate in determining whether a given tagout program does, in fact, provide full employee protection. Thus, when equipment is capable of being locked out, OSHA anticipates that it will be easier for employers to use that capability than to bypass it in favor of a tagout program. Third, for equipment which is not "capable of being locked out," OSHA has determined that the employer's energy control program shall use either lockout or tagout. In making this determination, the Agency recognizes the efforts of many employers, as reflected in various comments and testimony, to retrofit their equipment to accept lockout devices. However, for equipment which would require significant modification to make it capable of being locked, such actions are necessarily taken on a case-by-case basis. Despite the Agency's efforts to acquire data in this area throughout the course of the rulemaking, there is still inadequate information in the record to allow OSHA to make a determination on the overall costs or feasibility of modifying such equipment to accept lockout devices. Accordingly, for such equipment, the standard allows the use of lockout or tagout as part of the energy control program. Fourth, and perhaps most critical, OSHA reemphasizes that the selection of lockout or tagout is only one element of the overall energy control program. Locks and tags do not deenergize equipment; they are attached after the equipment is deenergized. The actual deenergization must be accomplished using a carefully—developed and implemented set of procedures, combined with adequate training of both affected and authorized employees. Therefore, in determining the protectiveness of the standard, it is necessary to look at the *entire* standard, and not just at portions of it in isolation. OSHA is confident that the interrelationship between the different requirements of the standard will result in effective protection to employees during the performance of equipment servicing and maintenance operations.

Although OSHA has determined that lockout is, in general, a safer means of assuring deenergization of equipment than tagout, the Agency has also determined that the record provides inadequate evidence on which to support the extension of lockout to all machinery and equipment throughout general industry. Two points must be emphasized in this regard: First, the standard is a "generic" one, and as such, will apply to virtually all types of machines and equipment in use in American industry today. The designs range from the simplest to the most complex, from the oldest to the newest, and from the most worker-intensive to the most automated. Despite this determined effort to obtain the necessary information in the course of this rulemaking, OSHA has been unable to develop the type and quality of evidence on the available technology and the impacts on the affected industries which would support a finding that lockout is feasible throughout general industry. It is not possible, based on the current record, to develop a reasonable estimate of the amount of equipment modification that would be necessary throughout industry to provide such equipment with the capability of accepting lockout devices. Secondly, OSHA is concerned about whether such existing equipment could be modified for lockout without the possibility of creating greater hazards to employees as a result of the modifications. This latter concern was shared by the State of Virginia's special Task Force on lockout/tagout in General Industry, which is made up of representatives from major employer and employee associations and major industries in that State. The Task Force recommendations to OSHA, which were submitted to the record by the Virginia AFL–CIO, provided that where some kind of modification would have to be made to equipment in order to accommodate a lock, the standard should only require a tagout procedure. (Ex. 13A).

OSHA acknowledges that there are significant problems involving the use of tagout devices, as discussed above. However, the Agency also recognizes that where equipment is not designed to accept a lockout device, tagout will need to be used, even though it does not provide the same assurance that the equipment will not become energized during servicing or maintenance. What becomes important in such situations, therefore, is for the standard to address as many of the weaknesses of tagout as possible, and to impose more stringent requirements which improve the capability of a tagout program to provide effective employee protection. In developing the Final Rule, OSHA has considered the major shortcomings of the use of tagout, as discussed in the comments and testimony, and has revised the proposed requirements to focus on appropriate means by which these shortcomings can be avoided or minimized. In particular, the Final Rule requires tagout devices to be considerably stronger and more durable than provided for in the proposal. The revised provisions on tagout are intended to deal with the problem of tagout devices deteriorating when they become wet or when they are exposed to a corrosive atmosphere. The final standard also requires the tagout device to have a much stronger means of attachment which cannot simply be twisted off or unwound from the energy isolating device. The record clearly indicates that the tag must remain securely affixed throughout the servicing operation in order to serve as an effective warning device. The use of flimsy attachments makes it too easy for an unauthorized employee to remove the device, either intentionally or inadvertently. As noted earlier, there is also testimony presented at the hearings about situations in which tags have become dislodged from their attachment point by environmental conditions such as wind and rain. Perhaps the greatest limitation of tagout is that it does not actually secure the energy isolating device and prevent the equipment from being reenergized. In lockout, the presence of a servicing employee's locking device on a piece of equipment will prevent another employee from activating that equipment, even if that other employee does not understand the energy control procedure. By contrast, tagout is highly dependent on human factors, and requires constant vigilance to ensure that tagout devices are not bypassed. In addressing this limitation, OSHA is requiring additional training for employees who work with tagout or who work in areas in which tagout is used. Such training must be provided on at least an annual basis. Further, the training program must incorporate information which emphasizes the problems involved with the use of tagout, to make employees aware of why they must not deviate from the requirements of the tagout program. In addition, the standard requires that the employer's energy control procedure incorporate provisions for monitoring and enforcing the proper use of tagout. OSHA has determined that these strengthened requirements will greatly enhance the protection which can be provided by tagout programs under the Final Rule.

Paragraph (c)(2)(i) states that either lockout or tagout may be used when the energy isolating devices are not considered "capable of being locked out," as defined in the standard. This paragraph allows the employer to choose either system in this limited circumstances. If the employer wishes to perform modifications of the equipment to accommodate a locking device, OSHA encourages such modifications, but as noted above, the standard does not require them.

In paragraph (c)(2)(ii), OSHA requires the use of lockout if the energy isolating devices are "capable of being locked out." However, an employer may use a tagout program for this equipment, but only if the employer can demonstrate that his/her tagout program provides "full employee protection." The term "full employee protection" is set forth in paragraph (c)(3), and is discussed more fully below. In brief, "full employee protection" in this context means that where equipment is capable of being locked out, the tagout program must be shown to provide equivalent safety to lockout for such equipment. This requirement also states that the attachment of a tagout device must be at the same point as a lockout device would have been attached.

An employer who chooses to use tagout in this situation must demonstrate that tagout will provide full employee protection, as explained in paragraph (c)(3). The employer must obviously demonstrate that the tagout program meets all tagout-related requirements which are spelled out in the standard, such as proper materials and construction of the tagout devices, the durability of the tag, and the capability of the attachment means to prevent the unauthorized or accidental removal of the tagout device. However, as noted earlier, OSHA does not believe that a tagout program which simply meets the requirements of the standard will be as protective as a lockout program, even though the tagout requirements have been strengthened considerably from the proposal. In order for the employer to demonstrate that a tagout program is as protective as lockout for a lockable piece of equipment, that employer will need to show additional elements which bridge the gap between lockout and tagout. OSHA believes that these elements will need to be evaluated by the Agency on a case-by-case basis. As discussed in paragraph (c)(3)(ii), the employer must consider additional measures which will further enhance the safety of the tagout program, such as the removal of an isolating circuit element, the locking of a controlling switch, or the opening of an additional disconnecting device. By requiring that the employer made a showing of the effectiveness of tagout in situations which are otherwise amenable to lockout, the standard assures that each type of control (lockout or tagout) will provide an acceptable level of safety for those employees who must perform the servicing or maintenance on the machine or equipment. Based upon the range of variations which are possible in different situations, OSHA believes that the comparative effectiveness of any particular energy control program can be made only after examination and evaluation of the factors present at each point of application.

Several parties contended that because of statistical limitations and due to underreporting, the use of an authorized and affected employees to determine the thoroughness of their training and their knowledge of the energy control program. Although the company data would certainly be reviewed by the Agency, it would be only one element of the overall determination. Further, OSHA anticipates that if energy control-related accidents have occurred, whether or not they have been reported, the employees in the facility would have knowledge of the circumstances surrounding those accidents, weaknesses in the procedure which may have contributed to the accidents, and any steps which the employer has taken since the accident to deal with the problem.

In response to OSHA's requests for additional information, NIOSH provided additional sugggestions on elements to be included in a tagout procedure in the event that lockout would not be implemented. (Ex. 50). NIOSH agreed with OSHA that management involvement is critical for both lockout and tagout procedures. NIOSH recommended that tagout procedures be documented (written) and should include the supervisory and enforcement duties and the disciplinary actions to be implemented when the procedure is not followed. Other elements recommended, such as training and hazard isolation, were quite similar to those already included in this rule. Most of the items recommended by NIOSH have been incorporated into the Final Rule in some form.

Although OSHA has serious concerns about the feasibility of retrofitting existing equipment to be lockout-capable, the Agency has different concerns about what is to de done when such equipment is replaced, when new equipment is installed, or when major modifications or renovations are performed to existing equipment. OSHA believes that the optimal time to incorporate lockout capability is where this capability is programmed into the design of the equipment in the first instance. For example, much of today's automated and computerized equipment contains programmed instructions in computer memory which can be lost if the equipment is totally deenergized. If the equipment were designed and built either with a back-up energy source, or by the splitting of the incoming energy for computer memory and mechanical functions, with the mechanical function power supply being lockable, or with other means of maintaining the memory while allowing the mechanical elements to be deenergized and locked out, servicing or maintenance could be performed safely on the deenergized equipment without losing the programming for its proper operation. The implementation of such control methods would, in OSHA's judgment, be a relatively small element in terms of both design and cost when compared to the overall design and construction costs of the equipment.

Accordingly, paragraph (c)(2)(iii) of the Final Rule requires that new equipment ordered or purchased after the effective date of this standard, and existing equipment which otherwise undergoing extensive repair, renovation or modifications, must be provided with a capability of being locked out if such design is feasible. This provision will assure that even if current equipment is not designed to be locked out, future generations of such equipment will have a lockout capability. Under the requirements of this Final Rule, this equipment will then be subject to the requirement to use lockout except when a tagout system can be shown to be equally effective. OSHA anticipates, however, that the designing of lockout capability into new equipment will encourage the employer to utilize that capability in the energy control program, rather than relying on tagout.

In paragraph (c)(4), OSHA requires that employers develop, document and utilize procedures for the control of potentially hazardous energy, and that the procedures clearly and specifically outline the steps to be followed, techniques to be used, and measures to be applied by the employer to assure that the procedure is used. OSHA also specifies that the employer ensure that the control measures are used by employees whenever they might be exposed to injury from the unexpected energization or start up of machines or equipment or the release of stored energy.

There were four commenters (Ex. 2-38, 2-58, 2-70 and 2-87) to this requirement for the development and utilization of a procedure. Two of these commenters (Ex. 2-38 and 2-70) objected to the use of the word "specific" when defining the elements of the procedure while one commenter interpreted the requirement as mandating a generalized procedure for each plant, as well as a specific procedure for every machine or piece of equipment. The last commenter on this issue (Ex. 2-87) suggested the standard make it clear that it may not be necessary to have multiple procedures. This commenter also alluded to the fact that the standard should require a determination that a need to control hazardous energy exists and how this should be done before work begins.

In this final standard, OSHA has retained the word "specific" when detailing the elements of the procedure. This was done to emphasize the need to have a detailed procedure, one which clearly and specifically outlines the steps to be followed. Overgeneralization can result in a document which has little or no utility to the employee who must follow the procedure. However, whereas the procedure is required to be written in detail, this does not mean that a separate procedure must be written for each and every machine or piece of equipment. Similar machines and/or equipment (those using the same type and magnitude energy) which have the same or similar types of controls can be covered with a single procedure.

The written energy control procedure required by this standard need not be overly complicated or detailed, depending on the complexity of the equipment and the control measures to be utilized. For example, if there is a single machine with a single energy source that must be isolated, and the control measure chosen is simple, such as opening an electrical disconnect and locking out that energy source during servicing, the written procedure could be very simple. The steps set forth in the standard can be incorporated into the procedure with very little detail, reflecting the lack of complexity of the control measure. In addition, the employer's procedures may not need to be unique for a single machine or task, but can apply to a group of similar machines, types of energy and tasks if a single procedure can address the hazards and the steps to be taken satisfactorily.

OSHA believes that because of the need to follow the steps in the energy control procedure carefully and specifically, and the number of variables involved in controlling hazardous energy, a documented procedure is necessary for most energy control situations. However, the Agency has determined that in certain limited situations, documentation of the procedure will not add markedly to the projections otherwise provided by the standard. These situations incorporate several common elements: First, there is a single source of hazardous energy which can be easily identified and isolated, and there is no potential for stored or residual energy in the equipment. This greatly simplifies the procedure for controlling the energy, since the single energy source is all that need to be isolated. Second, the isolation and locking out of that single energy source will totally deenergize and deactivate the machine or equipment. There are no collateral sources of energy which need to be addressed. Third, a full lockout of the energy source is achieved by a single lockout device which is under the exclusive control of the authorized employee performing the servicing or maintenance. As used in this provision, exclusive control means that the authorized employee is the only person who can affix or remove the device. The authorized employee follows all steps necessary for deenergizing the equipment, verifying the deenergization, performing the work, and reenergizing the equipment upon completion of servicing. Because the energy control elements are simple, with a single energy source being locked out and no other potential sources of unexpected activation or energization, the authorized employee can perform them without referring to a written document. Fourth, while the equipment is locked out, the servicing or maintenance cannot expose other employees to hazards. For example, shutdown and lockout of a conveyor cannot cause jams or other hazards at other conveyors which feed into the conveyor being serviced.

The exception is intended to apply to situations in which the procedure for deenergization, servicing, and reenergization can be carried out without detailed interactions of energy sources, machines, and employees. For example, a motor in a small machine shop is wired into a single electrical disconnect, with no other energy source, and the motor does not present the hazards of stored or residual energy. When the motor needs repair, the authorized employee can isolate the motor from the single energy source and lock it out, using his/her personal lockout device on the disconnect, in accordance with the procedures set forth in the standard. Under these conditions, and provided that no other employees are exposed to hazards from the servicing operation, the servicing may be performed without the need to document the energy control procedure.

When all of the conditions for the exception are met, the standard does not require the employer to document the energy control procedure. However, if the employer, in utilizing this exception, has an accident involving the machinery or equipment, in which the unexpected release of hazardous energy is a factor, this indicates the need for more formal treatment of the energy control procedure, and documentation then becomes necessary.

It should also be noted that a small business does not necessarily have small energy control problems. Much complex machinery and equipment can be found in workplaces with few employees, especially in highly-automated companies. From the standpoint of the safety to be achieved from development of and compliance with a written energy control procedure, there is nothing to indicate that a small employer needs a written procedure any less than a large employer. As discussed earlier, the available data clearly demonstrate the need for written procedures to control hazardous energy. For example, the BLS Work Injury Reports (WIR) (Ex. 3-3) indicated that printed instructions or posted

procedures had been provided to only 62 of 554 injured employees responding on this issue in the survey (See Table V, in section III of this preamble). The WIR results also clearly demonstrate the lack of differentiation of injuries based on size of establishment. Half of the total number of injuries took place in establishments of under 100 employees: Approximately 35 percent of the total number of injured employees responding to the survey were injured at workplaces with fewer than 50 employees, and another 15 percent occurred where there were between 50 and 99 employees (See Table I, in section III of this preamble). Therefore, with the limited exception discussed above, OSHA has determined that the requirements for written procedures are appropriate for all employers covered by this standard, regardless of size. The complexity of an employer's procedure will depend on the complexity of the energy control problem in the specific facility, and not on anything unique to or inherent in the number of employees or size of the facility.

It is nonetheless imperative that the employee who is performing the maintenance or servicing (who must utilize the energy control procedure) understands the hazards of the work and how to control them. It is for this reason that paragraph (c)(7)(vi) (which is also discussed below) requires, before the machine or equipment is even turned off, that the authorized employee have knowledge of the type and magnitude of the energy, the hazards of the energy to be controlled, and the procedure to be used.

The Appendix provides employers and employees with an example of a simple lockout procedure. Where appropriate, this procedure may be used as written in the Appendix by simply filling in the blanks. This procedure is not considered unique and can be applied with considerable flexibility to groups of machines or tasks. It may also be used as a guide to develop a more specific or detailed lockout or tagout procedure. The sample would need only minor changes to methods, procedures and/or text to be acceptable for many different workplace situations.

The standard, by being written in performance language, also addresses situations in which there is a need for entirely unique lockout/tagout procedures. There may be situations which might require the entire procedure to be unique for its purpose (one of a kind) in dealing with the hazards, or the employer may only need to provide a supplement to the general procedure. For some applications, the supplement could be in the form of a check list used for gaining access to the machine or equipment and for returning it to service. The check list might address the number and locations of the energy isolating devices in order to guarantee total deenergization. In most cases, if the procedure itself takes the form of a check list, this check list would need to reflect the necessary order of energy isolation and device application.

In paragraphs (c)(5) (i) and (ii), OSHA requires that the employer provide the necessary protective materials and hardware such as locks, tags, chains, adapter pins, etc., for attachment to the energy isolating devices. The standard also requires that the devices be unique to the particular use (the only ones authorized for the purpose); that they be durable, standardized and substantial; and that they identify the user.

There were three commenters (Ex. 2-28, 2-67 and 2-80) who commented on the employer providing the necessary protective materials and hardware. One commenter (Ex. 2-28) suggested eliminating the requirement for the employer to provide the needed lockout or tagout materials or hardware. OSHA disagrees with this contention. Whereas other types of protective equipment, such as safety shoes, may be of a personal nature, the protective materials and hardware used to lockout or tagout is more machine or equipment oriented. The employer is ultimately in the best position, based upon his/her knowledge of the construction and configuration of the plant, facility and/or the type of equipment, to judge or determine the type and quantity or number of items needed in that plant or facility to effectuate the control of energy during servicing or maintenance of the machines or equipment. If the employer orders the necessary hardware, he/she can ensure that the hardware complies with the provisions of the standard (that is, that the hardware is durable, standardized, substantial and identifiable). The purchase of a larger number of those materials and hardware can also result in an overall cost savings if enough of a particular item or several items are ordered in quantity.

One of the other commenters (Ex. 2-67) recommended eliminating the need for the employer to provide tags since tags should be used only when the equipment design does not allow lockout. OSHA has previously discussed the use of tags as an acceptable energy control measure under this standard. The final commenter (Ex. 2-80) recommended changing "securing or blocking" to "blocking and/or securing. to emphasize that there may be situations when the use of a combination of energy control techniques are necessary." OSHA believes that the standard already provides for situations in which more than one energy control method is necessary. The purpose of the standard as stated in paragraph (a)(2) is to require employers to establish and utilize procedures for disabling machines or equipment in order to prevent injury to employees. What is necessary and appropriate to control hazardous energy in a given situation is one the determinations which the employer must make when implementing the program. This final standard recognizes that it may be necessary to use several different means of controlling energy simultaneously to control a particular operation.

The standard utilizes performance language in imposing the above requirements. OSHA believes that the obligations imposed by paragraphs (c)(5) (i) and (ii) are not overly restrictive or complicated. To meet the requirement in paragraph (c)(5)(i) to supply protective equipment and hardware, the employer can either issue devices to each employee responsible for implementing energy control measures, or can exercise the option of simply having a sufficient quantity of the devices on hand at any given time and assign or distribute them to employees as the need arises. As noted earlier, all authorized employees will need to have these devices available to attach to energy isolating devices whenever they perform servicing or maintenance using the energy control procedure.

The proposed standard specified that lockout or tagout devices be singularly identified, shall be the only devices used for controlling hazardous energy, shall not be used for other purposes, and shall be durable, standardized, substantial, and identifiable. This requirement remains substantially unchanged in the Final Rule. Three commenters (Ex. 2-53, 2-64 and 2-70) objected to not allowing energy control devices to be used for other purposes. This restriction was proposed, and is being adopted to ensure that the sight of a distinctive lock or tag will provide a constant message of the use that the device is being put to and the restrictions which this device is intended to convey. If lockout or tagout devices are used for other purposes, they can lose their significance in the workplace. For the energy control procedure to be effective, these devices must have a single meaning to employees: "Do not energize the equipment when such a device is affixed to it."

In paragraph (c)(5)(ii)(A) OSHA proposed that lockout or tagout devices be durable. There was no specific comment on this provision. In order to overcome some of the concerns of commenters to the use of tags, OSHA is adding in the Final Rule that tagout devices must be constructed and printed so that exposure to weather or other environmental conditions which exist in the workplace will not cause the tag to become unserviceable and/or the message on the tag to become illegible. For any sign, tag or other message bearing item, the message must remain legible for the employees to be able to ascertain the meaning and intent of the message.

In paragraph (c)(5)(ii)(B) OSHA is requiring that lockout or tagout devices be standardized in one of the following criteria: color, shape, size, print or format, in order that they be readily identificable and distinguished from other similar devices found in the workplace. In addition, the final rule adds a requirement for the use of a standardized print and format for tagout devices. This is done to ensure that the tagout devices, which rely exclusively on employee recognition for their effectiveness, will be so unique as to minimize the chances of their being misidentified or their message misinterpreted.

In paragraph (c)(5)(ii)(C) OSHA requires that lockout or tagout devices be substantial enough to minimize the possibility of premature removal. The standard requires that lockout devices be substantial enough to prevent their removal without the use of excessive force or unusual techniques. Tagout devices and their means of attachment are similarly required to be constructed so that the potential for inadvertent or accidental removal is minimized. Tag attachment means are further required to be attachable by hand, and to be of strength equivalent to a one-piece non-releasable, self locking cable tie. These additional requirements are being imposed to ensure that tags do not become disconnected or lost during use, thereby negating their effectiveness.

In item (d), OSHA requires that lockout or tagout devices identify the employee who applies the device or devices. This requirement is similar to the proposal. Identification of the user provides an additional degree of accountability to the overall program. It enables the employer to inspect the application of the energy control procedure and determine which employees are properly implementing its requirements. If locks or tags are not being properly attached by an employee, identification on the locks and tags will enable the employer to locate that employee and correct the problem promptly, including additional training, as necessary. For other employees, this requirement will enable them to determine at a glance which authorized employees are performing a given servicing operation. It puts them on notice that if questions arise about the servicing or the energy control procedure, the persons listed on the lockout and tagout devices are the appropriate persons to ask. The authorized employee has the additional assurance that other employees know of his/her involvement in the servicing, and that only he/she is allowed to remove the device.

There were three commenters (Ex. 2-21, 2-38 and 2-62) who objected to having to mark or identify locks. These commenters claimed that identifying a lockout device with a particular employee was unnecessary. OSHA believes that knowing who applied a lockout device to a machine or equipment can save time and lives. If an employee, upon completing a job, forgets to remove a lockout device, the identity of the employee can be immediately determined and the employee made available to complete the procedure. If that employee cannot be located, it is possible that he/she is still working on the equipment. It would then be possible to check out the area and assure that the employee and others are out of the danger area before the device is removed. Marking a lockout or tagout device is a simple way of identifying the person who applies it, and can prevent the inadvertent reenergization or reactivation of equipment before that employee has been located and has moved clear of the equipment. Thus, marking the identity of the employee who uses a lockout or tagout device is an appropriate safeguard.

Marking of the lockout or tagout devices can also promote a sense of security in employees, in that each device is the individual employee's device, used only for his or her protection. This sense of identity also can be used to encourage willing utilization of the energy control procedure. When an employee can identify with a part of the program he/she controls for his/her own protection, that employee will likely be an active participant in making the program work.

In paragraph (c)(5)(iii), OSHA states that the legend (major message) on tagout devices must warn against hazardous conditions if the equipment is re-energized. Five examples of major message are provided in paragraph (c)(5)(iii): Do Not Start, Do Not Open, Do Not Close, Do Not Energize, and Do Not Operate. OSHA recognizes, however, that these messages may not be sufficient to cover all conditions involving hazardous energy control. For that reason, the above stated legends are only examples of what must be stated. The use of graphics, pictographs or other symbols to convey the message which the tag represents serves the same purpose as the written message and therefore would be acceptable to OSHA. Additionally, the use of danger tags would have to meet the requirements of § 1910.145.

There were 8 commenters (Ex. 2-20, 2-32, 2-38, 2-41, 2-53, 2-62, 2-70 and 2-74) who discussed the requirement contained in (c)(5)(iii). Three of the commenters (Ex. 2-38, 2-53 and 2-62) suggested elimination of the wording in the requirement "shall warn against hazardous conditions if the equipment is re-energized." This is a statement of the purpose of the tag. The significance of this message is imparted through the training of employees and enforcement of the program. The backbone of a tagout system is that when a tagout device is placed on an energy isolating device, it informs employees that the energy isolating device is not to be turned on or otherwise moved to a position which will allow the flow of energy. The printed message on the tag provides information about what the tag stands for and what it prohibits, and indicates the name of the employee who affixed it to the energy isolating device.

Three of the commenters (Ex. 2-32, 2-41 and 2-70) commented on the language of the proposal "and shall include the legends: * * * or similar language." Two of the commenters (Ex. 2-32 and 2-70) suggested amending the wording of the phrase to say, "and shall include the following legends: * * *" The proposal was intended to require that tags have some type of commonly used message which would serve to prohibit an employee from bypassing or disregarding the tag. The items listed (that is, "Do Not Start", "Do Not Open" etc.) were intended not to be an all inclusive or complete list of the possibilities but rather, to give an indication of the type of prohibitive major message which the tag could contain. Clearly, whatever language is chosen for the message of the tag must coincide with the prohibited action. Further, employees must know and understand that the tag really means "do not touch," regardless of the type of equipment or hazard involved.

Due to the severity of the risks associated with a lapse in the

implementation of the energy control system, paragraph (c)(6) requires that periodic inspections be performed at least annually in order to verify and to ensure that the energy control program is being properly utilized. One method for meeting the performance requirements in this paragraph would be to use random audits and planned visual observations to determine the extent of employee compliance. Another would include modifying and adopting ordinary plant safety tours to suit this purpose.

The periodic inspection is intended to assure that the energy control procedures continue to be implemented properly, and that the employees involved are familiar with their responsibilities under those procedures. A significant change in this requirement from the proposal involves the activities of the person performing the inspections. The inspector, who is required to be an authorized person not involved in the energy control procedure being inspected, must be able to determine three things: first, whether the steps in the energy control procedure are being followed; second, whether the employees involved know their responsibilities under the procedure; and third, whether the procedure is adequate to provide the necessary protection, and what changes, if any, are needed. The inspector will need to observe and talk with the employees in order to make these determinations. The Final Rule provides some additional guidance as to the inspector's duties in performing periodic inspections, to assure that he or she obtains the necessary information about the energy control procedure and its effectiveness. Where lockout is used, the inspector must review each authorized employee's responsibilities under the procedure with that employee. This does not necessarily require separate one-on-one meetings, but can involve the inspector meeting with the whole servicing crew at one time. Indeed, group meetings can be the most effective way of dealing with this situation, because it reinforces the employees' and that they need to follow the procedure carefully. Where tagout is used, the inspector's review of responsibilities extends to affected employees as well, because of the increased importance of their role in avoiding accidental or inadvertent activation of the equipment or machinery being serviced. OSHA believes that these reviews, which will need to be performed on at least an annual basis during the periodic inspections, will assure that employees follow and maintain proficiency in the energy control procedure, and that the inspector will be better able to determine whether changes are needed.

A related change from the proposal is found in the certification provision in paragraph (c)(6)(ii) of the Final Rule. In addition to the operation, date of inspection, and name of inspector, the Final Rule also requires identification of the employees included in the inspection. This change provides for the inspector to indicate which employees were involved with the servicing operation being inspected, in order to assure that these employees have had the opportunity to review their responsibilities and demonstrate their performance under the procedure.

Inspections must be made by an authorized employee other than one implementing the energy control procedure being inspected. The inspections must be designed and conducted to correct any deviations uncovered. In addition, the employer must certify that they have been performed. These inspections are intended to provide for immediate feedback and action by the employer to correct any inadequacies observed.

These inspections are intended to ensure that the energy control procedure has been properly implemented and to provide an essential check on the continued utilization of the procedure.

Some commenters (cf. Ex. 2-4, 2-39) suggested that the standard require employee participation in these inspections. However, the employer has the obligation of assuring proper utilization of the energy control procedure under the standard, and the periodic inspection is a means of assuring that such compliance is taking place. If an inspection reveals flaws in the implementation of the procedure, it is the employer who must make changes in the procedure, provide retraining to employees, and take other steps to make sure that the problems are corrected. Therefore, OSHA does not believe that a requirement for employee involvement in these inspections is necessary under the OSH Act. It should be noted that the standard requires such inspections to be performed by an authorized employee other than one implementing the particular procedure. Because the inspector is also an authorized employee, he/she will have the necessary knowledge to evaluate the effectiveness of the procedure being inspected, and to report back to the employer with regard to necessary corrective measures.

In this final standard, OSHA has retained the requirement for a periodic inspection (at least annually) to ensure that the energy control procedure required by this standard is being followed. Inspections must be done by authorized employees and are intended to identify and correct any deviations or inadequacies observed. The final standard retains the requirement for the inspections to be conducted by authorized employees, in order to assure that the work. (See paragraph (b) of the standard and the explanation of paragraph (c)(7) below.)

OSHA believes that periodic inspections by the employer are necessary to ensure continued compliance with the procedure. Therefore, this requirement remains unchanged.

In paragraph (c)(7), OSHA specifies that the employer provide effective initial training, periodic retraining, and certification of such training of employees. OSHA considers these requirements to be of critical importance in helping to ensure that the applicable provisions of the hazardous energy control procedure(s) are known, understood and strictly adhered to by employees.

As it is the case with the other provisions of this generic rule, OSHA believes that the training program under this standard needs to be performance oriented, in order to deal with the wide range of workplaces covered by the standard. However, in order to provide adequate information, any training program under this standard will need to cover at least three areas: The employer's energy control program, the elements of the energy control procedure which are relevant to the employee's duties, and the requirements of this Final Rule. The details will necessarily vary from workplace to workplace, and even from employee to employee within a single workplace, depending upon the complexity of the equipment and the procedure, the employee's job duties and their responsibilities under the energy control program, and other factors. Paragraphs (c)(7)(i) (A), (B), and (C) of the standard establish the amount of training that is required for the three groups of employees: "authorized" employees, "affected" employees, and all "other" employees. The relative degree of knowledge required by these three employee groups is in descending order, with the requirements for authorized employees demanding the most effort in training. Because authorized employees are charged with the responsibility for implementing energy control procedures, it is important that they receive training in recognizing and understanding all potentially hazardous energy sources that they might be exposed to during their work assignments, and that they also be trained in the use of adequate methods and means for the control of such energy sources. These employees are the ones authorized to implement the energy control procedure and to perform servicing of the machine or equipment. Therefore, they need extensive training in aspects of the procedure and its proper utilization, together with all relevant information about the equipment being serviced.

The training OSHA requires for "affected employees" is less stringent than that for "authorized employees," simply because affected employees do not perform servicing or maintenance operations which are performed under an energy control procedure. Affected employees are important to the overall protection provided in the energy control program, however, because such employees work in areas where the program is being utilized by authorized employees. It is vital to the safety of the authorized employees that the affected employees recognize lockout or tagout devices immediately, that they know about the purpose of those devices, and, most importantly, that they know not to disturb the lockout or tagout devices or the equipment to which the devices are affixed. Therefore, the standard requires that affected employees be instructed in these matters. The instruction needs to be sufficient to enable the employees to determine if a control measure is in use. The instruction also needs to make affected employees aware that disregarding or violating the prohibitions imposed by the energy control program could endanger their own lives, or the lives of coworkers. Considerable latitude is given to employers in the development and implementation of the required training for both authorized and affected employees.

There was considerable comment on the training of the different classes of employees based upon the definitions and duties of the different employees as enumerated in the proposed standard. Five commenters (Ex. 2–5, 2–32, 2–44, 2–67 and 2–74) objected to different training for authorized and affected employees while 10 commenters (Ex. 2–28, 2–36, 2–39, 2–42, 2–46, 2–55, 2–58, 2–70, 2–73 and 2–85) objected to training "other" employees. One commenter (Ex. 2–27) suggested expanding the training to coincide with the training requirements of other OSHA standards.

The training requirements for the different classes or types of employees as they are defined in this final standard are performance oriented, thereby providing the employer with considerable flexibility in how the training should be conducted. The employer is permitted to use whatever method he/she feels will best accomplish the objective of the training.

OSHA also requires in paragraph (c)(7)(i)(C) that all other employees shall be instructed about the restrictions imposed upon all employees by the energy control program. This instruction as the employer's lockout/tagout procedure can be conveyed during new employee orientation sessions, by the use of employee handbooks, or through regularly scheduled safety meetings. The training of employees other than authorized and affected employees is considered by OSHA to be essential since other employees working in the plant or facility have been known to have turned on the power to a machine or equipment on which another employee is performing a servicing or maintenance activity. Inadvertent and intentional activation of machines or equipment by employees other than those working on the machine or equipment is not limited to affected employees. The training requirements for these other employees are minimal, essentially required only that these employees know what the energy control program does and that they are not to touch any locks, tags or equipment covered by this program.

In paragraph (c)(7)(ii), OSHA is establishing a requirement for additional training for all employees in plants or facilities where tagout is the preferred method of energy control. The need for this additional or supplemental training for employees in those facilities is based upon the fact that the use of tagout relies upon the knowledge of the employees and their adherence to the limitation imposed by the use of tags. Several commenters who use tagout programs stated in their comments and testimony (cf Ex. 47, 52, Tr. p. W2–5, W2–27 and H199–207) that tagout can only be effective when the program provides for extensive training and reinforcement of the elements of the tagout procedures.

In paragraph (c)(7)(iii), OSHA requires that periodic retraining be provided for authorized employees *at least annually*. This retraining may need to be conducted more frequently, that is, whenever and inspection under paragraph (c)(6) reveals, or whenever the employer has reason to believe, that there are deviations from or inadequacies in the energy control procedure.

Many participants and commenters (Ex. 2–29, 2–44, 2–57, 2–63, 2–67, 50, 52, 60, 62, Tr. p. W1–55, W1–165, W1–206, W1–263, W2–63, H85, H159, H166) suggested that the basic requirement for retraining should provide for the training to be conducted on a regular basis at specified minimum intervals. These commenters pointed out the fact that although the proposal said that the retraining shall be periodic, the criteria for conducting the training was based solely upon the periodic inspection or the employer having reason to believe that there were program problems.

The above comments and testimony clearly indicated that the "periodic" training in the energy control procedure needs to be provided at a minimum stated interval, rather than relying solely upon the employer's periodic inspection. Based on many current training programs, including those throughout the automobile industry it was argued that annual retraining would provide adequate assurance that employees understand their duties under abilities to carry out the energy control procedure.

There were 13 commenters (Ex. 2–20, 2–32, 2–36, 2–39, 2–41, 2–43, 2–44, 2–52, 2–62, 2–69, 2–70, 2–74 and 2–87) who suggested limiting retraining to those individuals and in those instances when there is an identified problem. These commenters reasoned that retraining should not be required unless there is some indication to the employer that it is needed.

OSHA believes that the effectiveness of training diminishes as the time from the last training session increases. Without the imposition of a requirement for periodic retraining of the employees who are critical to the success of the energy control program, that is, the persons who must utilize the procedure, the overall effectiveness of the energy control program will diminish over an extended period of time. The Agency has determined that the proposed provision, i.e., simply relying upon the finding of a problem with the program to trigger the retraining program, does not properly address the problem. Retraining is intended to provide for continued proficiency, and not merely to remedy situations in which such proficiency has been found wanting.

In addition to the periodic retraining as discussed above, additional retraining is to be conducted whenever a problem is identified during periodic inspections, or whenever the employer has reason to believe that there are problems with the energy control procedure itself or with its implementation. This retraining should be more concentrated or more encompassing than the routine retraining, based upon the severity of

the problem encountered with the use of the energy control program in the workplace.

OSHA is of the opinion that full and uniform utilization of an energy control procedure is necessary in order for that procedure to maintain its effectiveness. Every effort should be made during the periodic inspection performed under paragraph (c)(6) to determine whether or not the procedure is being used properly. If deviations are observed, retraining in accordance with paragraph (c)(7)(iii)(B) would be required. However, retraining could be triggered by events separate from the finding of a periodic inspection. For example, an employee working with an energy control procedure might be injured in the course of his duties, or there might be a "near miss," where no one is actually injured, but where the energy control program has failed nonetheless. If a subsequent investigation indicates that an employee failed to operate within the guidelines of the control procedure, retraining would be required.

In addition, the investigation might also reveal that the procedure itself was not adequate. Such inadequacies in the procedure could be the result of using a general procedure that does not handle effectively a specific application, or they may arise because changes have been made to the equipment or process that did not take the existing energy control procedure into consideration. In such cases when changes to the energy control procedure must be made, the employer is required to retrain employees in the new or revised procedures in accordance with paragraph (c)(7)(iii)(B).

In the Final Rule, when lockout is being implemented, OSHA is limiting the annual retraining requirement to authorized employees. These are the employees who must implement the energy control procedure, and their protection is the primary consideration under this standard. Because their safety requires them to follow the steps of the procedure precisely, these employees must be properly trained, and that training must be reinforced to assure their continued proficiency. By contrast, affected employees are not provided with annual retraining under this standard when lockout is used. In these situations, affected employees are initially trained about the energy control procedure and its implementation, and the relevance of that procedure to his/her work. Under lockout conditions, the essential element of the affected employee's training is a simple one: Locks are not to be defeated or bypassed, and locked out equipment must remain deenergized. This message is reinforced whenever the affected employees work in an area where energy control procedures are being implemented, because paragraph (c)(9) of the standard requires that such employees be notified before the energy control devices are applied. Further, when a lockout device is attached to a piece of equipment by an authorized employee, an affected employee should not be able to remove the lock, and thus will not have the potential of placing the authorized employee in danger.

By contrast, however, paragraph (c)(7)(iv) of the Final Rule requires that when tagout is used, both authorized and affected employees must be retrained annually in the use of the tagout system. This additional training is necessary because of the inherent difficulties of tagout systems as opposed to lockout: The use of tags relies uniquely upon the knowledge and training of the employees involved, and the continued reinforcement of the meaning of the tags. In a lockout system, even if an affected employee has not been adequately trained, the lock will prevent that employee from reenergizing the equipment. Tags, on the other hand, can be inadvertently or intentionally bypassed or ignored by an affected employee, because the tags do not actually prevent the activation of the tagged and equipment. Employees operating under a tagging system must be constantly vigilant, and their awareness of the importance of the tagout device must be frequently reinforced. OSHA believes that when tagout is used, retraining must be provided on at least an annual basis, in order to maximize its effectiveness.

Paragraph (c)(7)(v) requires that employers certify that the training required by this standard has been provided. This requirement is unchanged from the proposal. Certifications are intended to cover both the initial training and the periodic retraining. In addition to certifications, the employer must be able to demonstrate that the training includes all elements of the energy control procedure which are directly relevant to the duties of the employee. The adequacy of the training can be evaluated by the employer, employee, and OSHA alike, by comparing the elements of the training to the elements of the procedure, which is required to be in written form.

Several commenters recommended that there be a "record," rather than a "certification," that training has been performed (cf. Ex. 2–30, 2–62 and 2–89). OSHA believes that a written certification serves the same purpose, while minimizing the paperwork burden on employers. It should be noted that the certification is not intended as a means of evaluating the completeness or efficacy of the training; it only provides an indication that training has been performed. The quality and content of the training are not evaluated through the certification of performance. As noted earlier, the standard sets forth the elements which must be included in the training for the employees. In evaluating whether an employee has been adequately trained, OSHA will examine the employee's responsibilities under the energy control program in relation to the elements of the standard.

OSHA proposed in paragraph (c)(6), that energy isolating devices used for the control of potentially hazardous energy sources, including valves, be marked or labeled to identify the equipment supplied and the energy type and magnitude, unless they are positioned and arranged so that these elements are evident, and that the devices only be operated by authorized employees. OSHA reasoned that employees working with energy control procedures need adequate information about the hazards of the equipment that they are servicing, and they must be certain that the equipment they are working on is the same equipment that was intended to be disabled. They should feel confident that they have secured the correct energy control devices and are protected from the hazards of inadvertently working on energized equipment.

The proposed identification requirement of paragraph (c)(6)(i) would have applied to all energy isolating devices, including devices which control hydraulic, pneumatic, steam, and similar energy sources by the use of valves or similar devices to isolate and block energy flow. It would also have applied to the valves used in pipeline network process operations, such as those found in petroleum and chemical operations.

The proposed requirement for marking or labeling energy isolating devices to identify the equipment supplied and the type and magnitude of the energy, received considerable comment. Eleven commenters (Ex. 2–14, 2–20, 2–28, 2–32, 2–39, 2–51, 2–52, 2–53, 2–58, 2–69 and 2–70) questioned the need to specify the magnitude of the energy while two commenters (Ex. 2–32 and 2–34) questioned the ability to mark valves, etc. when the material and the magnitude of the energy contained in the material conveyed could be almost continuously variable. Seven commenters (Ex. 2–21, 2–34, 2–38, 2–46, 2–61, 2–69 and 2–70) suggested removing the requirement. Five commenters (Ex. 2–22, 2–44, 2–52, 2–58 and 2–59) proposed allowing the use of drawings, schematics, temporary tags or work permits to serve as an alternative to marking or labeling energy isolating devices. Two commenters (Ex. 2–39 and 2–62) recommended that training of qualified persons would supply the information rather than marking the energy isolating devices.

OSHA has determined that the marking or labeling of energy isolating devices is not reasonably necessary for the effectiveness of the energy control program. When employees need to know details on energy sources for protection under the standard, the energy control procedure is required to spell out this information, and the training must incorporate it, as well. For example, authorized employees, in order to perform their servicing or maintenance duties under the energy control procedure, are required to know the type and magnitude of the energy sources which must be controlled. The marking or labeling of the sources themselves will not provide the authorized employees with any additional information. Second, as far as affected or other employees are concerned, their role in the energy control program is essentially to understand what the program is designed to accomplish, and to recognized that when they see an energy isolating device with a tag and/or lock on it, they are not to touch the equipment, regardless of what the type and magnitude of the energy might be. OSHA believes that marking the equipment with this information would not enhance the protection of these employees, because their compliance with the energy control procedure does not depend upon knowledge of these details.

Accordingly, OSHA has eliminated the proposed requirement for marking or labeling energy isolating devices. In its place, OSHA is incorporating a specific requirement in paragraph (c)(7)(i)(A) that authorized employees be trained in the recognition of applicable hazardous energy sources, the type and magnitude of the energy available in the workplace, and in the methods and means necessary for energy isolation and control. OSHA further requires in paragraph (c)(7)(vi) that authorized employees must know the type and magnitude of the energy, the hazards of the energy to be controlled and the method or means to control the energy even before the machine or equipment is turned off. OSHA believes that employee knowledge of this information is essential to ensure that the correct energy control devices are used on the proper energy isolating devices and in the proper manner. This provision requires the employee to have that specific information prior to deenergizing the equipment, in order to control the energy and render the machine or equipment safe to work on. OSHA does recognize that the physical shutdown of the machine or equipment can be accomplished by either the authorized or affected employee.

The new paragraph (c)(8) requires that lockout or tagout be performed only by authorized employees. These are the only employees who are required to be trained to know in detail about the types of energy available in the workplace and how to control the hazards of that energy. Only properly trained and qualified employees can be relied on to deenergize and to properly lockout or tagout machines or equipment which are being serviced or maintained, in order to ensure that the work will be accomplished safely.

In paragraph (c)(9), OSHA requires that whenever lockout or tagout control might directly affect another employee's work activities, the employer or authorized employee must notify the affected employee before taking any action to apply or to remove lockout or tagout devices.

There were four commenters (Ex. 2–20, 2–21, 2–64 and 2–74) who discussed this provision. One commenter (Ex. 2–20) recommended that the notification occur after removal of the energy control device while one person (Ex. 2–21) suggested that the "qualified" persons not be required to notify affected employees of the energy control device removal, particularly in emergency repair conditions. Finally, two commenters (Ex. 2–64 and 2–74) insisted that the requirement was unnecessary, especially since employees must be trained and the lockout or tagout effectively prevents machine or equipment energization.

OSHA believes that this requirement is an essential component of the total energy control program. Notification of affected employees when lockout or tagout is going to be applied provides the perfect opportunity for the employer or authorized employee who notifies them of the impending interruption of the normal production operation to remind them and reinforce the importance of the restrictions imposed upon them by the energy control program.

OSHA believes that these measures are important to ensure that employees who operate or use machines or equipment do not unknowingly attempt to reenergize those machines or equipment that have been taken out of service and deenergized for the performance of activities covered by this standard. The lack of information regarding the status of the equipment could endanger both the servicing employees and the employees attempting to reenergize or operate the equipment. Such notification is also needed after servicing is completed to assure that employees know when the control measures have been removed. Without such information, employees might mistakenly believe that a system is still deenergized and that it is safe to continue working on or around it.

This standard for the control of hazardous energy is a "generic" standard, and is written largely in terms of the procedures and performance to be achieved. OSHA does not consider it practical to prescribe specific definitive criteria for each possible use of energy control measures in such a wide ranging standard. However, the Agency believes that the standard will enable the user to make a choice of the most effective control measure involving the use of locks or tags, or a combination of the two devices for securing energy isolating devices. (As discussed above, paragraph (c) of the standard provides criteria for the selection of such devices.)

The main thrust of the standard is to mandate the development, documentation and implementation of control procedures, and this is to be accomplished as outlined in paragraph (d) of the standard. The employer is given considerable flexibility in developing a control program, and such a program will be evaluated by OSHA compliance officers to determine whether it meets all the criteria in this standard.

Although the Final Rule notes the Agency preference for lockout, this standard does not impose lockout requirements in all cases for reasons discussed earlier. OSHA intends to address the need for and the feasibility of more specific lockout or tagout requirements for particular types of equipment or processes on an individual basis, as appropriate, in future rulemakings. This will involve revision of existing standards and promulgation of new ones, as necessary. (Examples of current provisions in the OSHA standards which contain specific lockout/tagout requirements can be found in the previous discussion of proposed paragraph (a)(3)(iii).)

Paragraph (d) of both the proposal and Final Rule provides that five separate and distinct steps be followed in meeting the procedural requirements of paragraph (c)(1) (Procedure) and the application of energy control (lockout or tagout) measures, and that the actions be taken in the sequence presented. Paragraph (d)(1) requires that in preparation for shutdown of machinery or equipment, the authorized employee must know about the type and magnitude of the energy, the hazards involved, and the means of controlling them. Paragraph (d)(2) then requires that the machine or equipment be turned off or shut down by an authorized employee according to the established procedures. This is the starting point for all subsequent actions necessary to put the machine or equipment in a state that will permit employees to work on it safely.

In many operations, activation of an electrical push-button control or the movement of a simple throw switch (electrical, hydraulic, or pneumatic) to the "stop" or "off" mode is sufficient to meet this provision. In other cases, however, such as those found typically in a refining or chemical process, there are control devices that do not necessarily address an "off-on" or "start-stop" condition (i.e., level controls, pressure controllers, etc.). In these instances, a series of predetermined steps may be necessary to achieve a shutdown of the machine or equipment.

One commenter (Ex. 2–28) suggested that any qualified (trained) employee be allowed to shut down or turn off machines or equipment. Another commenter (Ex. 2–41) suggested allowing machine operators to shut down or turn off the equipment. OSHA is aware that although an authorized employee would usually have the necessary knowledge and capability to shut down machines or equipment, a machine or equipment operator or user should also be in a position and know how to shut down the machine or equipment he/she is utilizing. In many cases, allowing a machine or equipment operator or user to shut it down when something goes wrong may save time and money, and may possibly avoid an accident. In many cases, the affected employee may be infinitely more familiar with the shutdown procedure for a machine or equipment, and would be able to accomplish the shutdown more rapidly and safely than an authorized person who does not work with that particular machine or equipment every day.

In the event that a machine or equipment malfunctions, the wise and prudent thing to do in most cases is to require that the machine or equipment be immediately shut down. Shutting down a machine or equipment is analogous to stopping the production operation. Contrary to the opinion of one commenter (Ex. 2–71) who stated that OSHA should not mandate equipment shut down as the mandatory first step of the procedure, OSHA believes that stopping the machine's production function is the necessary and appropriate first step in the procedure. This commenter suggested that some machinery should have components moved to a safe position before shutting off the power. OSHA believes that the necessary first step is to interrupt the production process to allow non-servicing (affected) personnel to move clear of the machinery or equipment. Once this is done and employees are not exposed to a hazard, the machine or equipment can be restarted by the authorized employee under the guidelines of paragraph (f)(1) when necessary to allow positioning of the machine or equipment, or components thereof.

Following shutdown of the machine or equipment as outlined in (d)(2), paragraph (d)(3), as the next step in the procedure, provides that energy isolation devices be physically located and operated in such a manner as to isolate the machine or equipment from the energy source(s). For example, once an electrical push-button control has been utilized to stop the movement of machine or equipment parts as the first step of the shutdown procedure, isolation can then be accomplished by ensuring that the push-button circuitry cannot be supplied with additional electrical energy. For such equipment, the isolation requirement can be accomplished by the employee's actions in tracing the path from the control toward the energy source until he/she locates the energy isolating device, and moving the energy isolating device control lever to the "safe," "off," or "open" position. Performing these actions will prevent the reintroduction of energy to the push-button circuitry and will isolate the operating control and the machine or equipment from the energy source.

One commenter (Ex. 2–41) suggested that OSHA add the restriction that only authorized employees be allowed to either locate and operate or supervise the operation of energy isolating devices. Instead of adding individual restrictions to each of the procedural steps of the standard, OSHA has added a new paragraph (c)(8) to the final standard which requires that all steps of the procedure except initial shutdown of the equipment as provided in paragraph (d)(1) be performed only by authorized employees. Since the use of lockout or tagout is presumed by OSHA to be individual protection, identification and operation of the energy isolating devices must be done only by the authorized employees who are applying the locks or tags under the procedures.

As the fourth step in the procedure, paragraph (d)(4) provides that action be taken to secure the energy isolating devices in a "safe" or "off" position. This paragraph requires that appropriate and effective lockout or tagout devices be affixed to each energy isolating device by the authorized employee, and that they be attached so as to prevent reactivation of the machine or equipment.

Where no specific standard presently requires the use of lockout versus tagout, paragraph (d)(4) requires the employer to select an appropriate and effective method, in accordance with the criteria set forth in paragraph (c)(2) above. OSHA is of the opinion that, as a general rule, when it is feasible, the physical protection offered by the use of a lock, when supported by the information provided on a tag used in conjunction with the lock, provides the greatest assurance of employee protection from the release of hazardous energy. OSHA has discussed in the section entitled "Major Issues" the arguments for the use of lockout and tagout.

Paragraph (d)(5) provides that the next step taken in the energy control procedure is to determine the presence of, and relieve, disconnect and/or restrain all potentially hazardous, stored or residual energy in the machine or equipment. Up to this point, the purpose of following all the steps of the procedure has been to enable the employee to isolate and block the source of energy feeding the machine or equipment to be worked on, at a point beyond which it can not be bypassed. However, energy can very easily be trapped in a system downstream from an energy isolating device, or can be present in the form of potential energy from gravity or from spring action. Stored or residual energy of this sort cannot be turned on or off; it must be dissipated or controlled.

When energy may still be present in a system that has been isolated from the energy source, this paragraph requires that energy to be controlled before an employee attempts to perform any work covered by the scope of the standard. Compliance with this provision might require, for example, the use of blocks or other physical restraints to immobilize the machine, machine components, or equipment where necessary for control of the hazard. In the case of electrical circuits, grounding might be necessary to discharge hazardous energy. Hydraulic or pneumatic systems might necessitate the use of bleed valves to relieve the pressure.

There were four commenters (Ex. 2–32, 2–71, 2–74 and 2–80) who discussed the requirement for the release or restraint of stored or residual energy. One commenter (Ex. 2–71) pointed out that there are several types of stored or potential energy which only the concept of zero mechanical state (ZMS) adequately covers. Examples of these hazards are machinery components which run on a cam or other concentric. For this type of machinery, the cam or concentric dictates the motion of the component or pivotal machine components which could be set in motion by inadvertent employee contact.

ZMS is the concept which was originally developed to simplify the requirements for disabling sophisticated machines and processes by reducing the possibility of mechanical movement to a minimum. The concept of ZMS is spelled out in the ANSI Z241.1–1975 American National Standard Safety Requirements for Sand Preparation, Molding and Coremaking in the Sand Foundry Industry. (Ex. 2–71). ZMS specifies that every power source that can produce movement of a machine member must be locked out.

OSHA has reviewed this aforementioned consensus standard and believes that adoption of this OSHA standard will better effectuate the purposes of the OSH Act. The OSHA standard requires the adoption and utilization of a complete program for the control of hazardous energy, including energy sources not specifically addressed by the ANSI Z241.1 standard. Further, OSHA believes that the energy control procedures established in this final rule are consistent in most respects with those of ANSI Z241.1.

The Final Rule addresses these and other hazards of stored or residual energy in a performance manner. Rather than trying to determine all of the potential manners in which this energy can be stored or retained in machines, equipment and the materials being utilized in the production process, as noted earlier, OSHA requires in paragraph (d)(1) that the authorized employee must have knowledge of the energy, its hazard and how to control it (including stored or residual energy). This paragraph (d)(4) requires the stored or residual energy to be relieved, disconnected, restrained or otherwise rendered safe as part of the energy control procedure.

One commenter (Ex. 2–74) suggested adding the phrase, "unless stored mechanical energy is a necessary element in the equipment or process." OSHA has answered this objection by requiring in this provision that stored or residual energy must be rendered safe before the servicing or maintenance may be conducted. OSHA believes that if stored or residual energy is hazardous, something must be done to protect the employees.

One commenter (Ex. 2–80) said that OSHA should consider a block, chain or other instrument used for restraining stored or residual energy to be a type of energy isolating device which does not require a lock or tag. Although OSHA defines a block as a form of energy isolating device, the requirement for the use of locks or tags is separate and distinct from the requirement for restraining stored or residual energy and the addition of a lock or tag, in most cases, would not materially add to the effectiveness of the block.

One commenter (Ex. 2–32) suggested making it clear that the stored or residual energy is only that which is downstream from the energy isolating device. OSHA acknowledges that the standard is intended to control energy as it relates to the energy isolating device and the machine or equipment being serviced, and that the only stored or residual energy addressed by the standard is that which could reenergize that equipment or be released while the servicing operation is being performed.

In paragraph (d)(4)(ii) the standard requires that verification of isolation shall be continued until the servicing or maintenance is completed when the possibility of the reaccumulation of stored energy exists. There was one commenter (Ex. 2–32) who stated that no work should be allowed to proceed until there is assurance that reaccumulation of stored energy cannot occur.

OSHA believes that this requirement of the standard should remain as proposed since there is no manner to ensure that some leakage or drainage of energy or energy containing substances, such as supercooled or cryogenic fluids, can occur. In the case of one of those substances being present in a piping, containment or transport system, a certain amount of leakage may occur without endangering employees. However, if servicing or maintenance must be performed on such a system, the standard requires the employer to continue to verify the isolation of energy sources which may be hazardous, in order to assure that such leakage does not approach a dangerous level. This may involve means such as continuous monitoring for the displacement of oxygen or the buildup of the concentration of the substance toward the lower explosive limit of the substance, such as could occur with a hydrogen system.

In paragraph (d)(6), as the sixth step in the energy control procedure, the authorized employee must ensure that the previous steps of the procedure have been taken to isolate the machine or equipment effectively. This must be done prior to starting the servicing or maintenance work. The authorized employee needs to verify that the machine or equipment has been turned off or shut down properly as required by paragraph (d)(2) of this standard; that all energy isolating devices were identified, located and operated as required by paragraph (d)(3); that the lockout or tagout devices have been attached to energy isolating devices as required by paragraph (d)(4); and that stored energy has been rendered safe as required by paragraph (d)(5).

This step of the procedure may involve a deliberate attempt to start up equipment which should not be capable of activation because of the application of the energy control devices. It is an action intended to assure the employee that energy from the main power source has been effectively isolated, that residual or stored energy has been blocked and that injury could not result from inadvertent activation of the operating controls. Another means of testing the machine or equipment is by the use of appropriate test instrumentation. This method would be appropriate for use in cases involving electrical circuits and equipment, for example, where verification of isolation could be accomplished by using a voltmeter to determine that there is no electrical energy available to the machine. Similar test equipment can be utilized to test for the presence of other energy types and sources.

OSHA also considers the use of visual inspection procedures to be of critical importance throughout the lockout or tagout procedures. Visual inspection can confirm that switches, valves, breakers, etc. have been properly moved to and secured in the "off" or "safe" position. Observing the position of the electrical main power disconnect switch can, for example, confirm that the switch is either in the "off" (open) or "on" (closed) position. Visual inspection can also verify whether or not locks and other protective devices have been applied to the control points in a manner that would prevent the unsafe movement of the switches or valves. Finally, a

visual inspection can be used to verify that isolation has taken place by determining that all motion has stopped and that all coasting parts such as flywheels, grinding wheels, saw blades, etc., have come to rest.

OSHA emphasizes that in order to verify that hazardous energy has been isolated, the authorized employee may need to use a combination of the above methods. The appropriate combination will depend upon the type of machinery or equipment involved, the complexity of the system, and other factors.

Paragraph (e) requires that certain actions be taken by authorized employees before lockout or tagout devices are removed from energy isolating devices. These actions are intended to ensure that: (1) The machine or equipment has been returned to an effective operating condition; (2) any employees who might be exposed to injury due to the process of restoring energy are made aware that such process is to begin; and (3) those employees having the responsibility for removal of the devices have been identified together with the specific conditions necessary for the procedures to take place.

One commenter (Ex. 2–70) contended that the requirements of paragraph (e) were unduly burdensome and impractical in large plants where numerous employees may be working. OSHA does not believe that this is the case. When servicing or maintenance is done on a large machine or complex system of equipment by a large number of employees, the machine or equipment would probably be operationally intact before the work begins. When the work is completed, paragraph (e)(1) merely requires that before the equipment is reenergized, the employees who did the servicing or maintenance work complete the job by replacing guards and other machinery components and cleaning up after themselves. Paragraph (e)(2) then requires a check for safe location of employees and notification that the equipment is to be reenergized. A simple procedure to follow to verify that the work area and the machinery is ready to be used for its production function is for a foreman, supervisor or leadman (whoever is in charge) to ask the workmen if they are done and then to spot check to ensure that all appears ready to resume normal operations.

Because each servicing employee will have his/her own lockout or tagout device attached to the energy isolating device during the servicing operation, the person in charge of the servicing operation will first determine whether all such devices have been removed by the servicing employees. This is an essential step in the procedure, and paragraph (e) requires that a final verification be performed to ensure that it is safe to reenergize the equipment after servicing is completed. Further, a check on the satisfactory completion of the work can also ensure that the machine or equipment will not be damaged by its start up. Although the purpose of the final check is to protect employees, it can also prevent needless downtime of the machine or equipment because the servicing or maintenance was not done correctly and/or completely the first time.

Paragraph (e)(1) requires that the workplace area around the machine or equipment be inspected to ensure that nonessential items have been removed and that equipment components are operationally intact. This step ensures that tools, machine parts and materials have been removed, and that mechanical restraints, guards and other machine parts have been replaced before returning the machine or equipment to its operational mode. Depending on the complexity of the machinery and the type and degree of servicing performed, visual inspection alone might be sufficient to meet this requirement, or there might have to be additional measures such as check lists and other administrative procedures.

One commenter (Ex. 2–28) suggested the elimination of the words "nonessential items" from this requirement and to substitute words which indicate that the only things that must be removed are those machines which could cause injury to employees or damage to items. OSHA believes that the cleanup requirement must of necessity be a broad one, since virtually any extraneous item in the servicing area could cause injury to employees if the machinery or equipment were to be reenergized before such items are removed. Further, OSHA believes that the cleanup process should not involve an evaluation of whether each item in the area could or could not cause injury. If an item does not have to be in the servicing area after the servicing is completed, OSHA believes that the prudent step is to assure that it is removed before the equipment is reenergized. Accordingly, paragraph (e)(1) is not being changed from the proposal.

In paragraph (e)(2), OSHA proposed that the work area be checked to be sure that employees are clear of the machine or equipment before energy is restored to it. This determination will usually include a visual inspection, and depending on the scope of the operation and the equipment involved, may involve the use of administrative procedures and warning devices such as horns, bells or buzzers.

There was one commenter (Ex. 2–28) who discussed this requirement. This commenter suggested that the terms "work area" and "all employees" were vague and misleading. OSHA believes that the "work area" for servicing will depend upon many factors, such as the type of equipment being serviced, the type of energy involved, and the extent of the servicing operation. OSHA's intent is that the work area include any area in the immediate vicinity of the machine or equipment being serviced, in which employees might be endangered by the startup process. Because of the broad scope of this standard, it is not possible to define with greater specificity what this area will encompass for any given workplace or servicing operation. The employer is in the best position to evaluate the equipment in the workplace, and to make a determination of areas where employees may be exposed to the hazards of the machinery or equipment.

It cannot be overemphasized that employees performing tasks on deenergized equipment may be exposed to hazards involving serious injury or death if the status of the lockout or tagout control can be changed without their knowledge. For this reason, OSHA requires in paragraph (e)(3) that lockout or tagout devices be removed by the employees who applied them. The proposal considered whether an exception should be provided for two types of situations in which the device may be removed under the direction of an authorized employee using specific procedures. Paragraph (e)(3)(i), as proposed, would have permitted other authorized employees to remove a lockout or tagout device when the employee who applied the lockout or tagout device is not available to remove it. This provision was intended to cover situations such as those that might arise from the sudden sickness or injury of an employee, key loss, or other emergency conditions. Proposed paragraph (e)(3)(ii) would have permitted use of the exception for unique operating activities involving complex systems, where the employer could demonstrate that it was not feasible to have the device removed by the employee applying it. This was intended to provide flexibility in operations similar to that where the removal of a lockout or tagout device at a remote electrical transmission or distribution system location was required and the process was controlled by a written procedure that uses an authorized employee operating from a central control point to communicate instructions to employees working in the field.

These were 9 commenters (Ex. 2–29, 2–32, 2–44, 2–50, 2–57, 2–58, 2–59, 2–63 and 2–70) who discussed allowing exceptions to the rule requiring that lockout devices have to be removed by the employees who applied the devices. Two commenters (Ex. 2–29 and 2–44) stated that the exceptions as written were too broadly drawn and would nullify the standard. Several commenters (Ex. 2–32, 2–57 and 2–63) claimed that allowing any exceptions would be unsafe. In contrast, there were four commenters (Ex. 2–50, 2–58, 2–59 and 2–70) who suggested that the exception should be more flexible so that the employer has more leeway, such as allowing the existence of either, rather than both, of the two conditions spelled out in proposed paragraphs (e)(3)(i) and (e)(3)(ii) to trigger the exception.

In paragraph (e)(3) of this Final Rule, OSHA is requiring that as a general rule, the authorized employee who affixes a lockout or tagout device is the only one allowed to remove it. OSHA believes that each such employee must have the assurance that the device is in his/her control, and that it will not be removed by anyone else except in an emergency situation. The entire energy control program in this standard depends upon each employee recognizing and respecting another employee's lockout or tagout device. The servicing employee relies upon the fact that he/she applied the device, and assumes that it will remain on the equipment while he/she is exposed to the hazards of the servicing operation.

OSHA can envision very few instances which would justify one employee's removal of another's lockout or tagout device. However, in a true emergency, and not merely because the employee is not available, the employer may be able to demonstrate a need to remove an employee's lockout or tagout device. An exception to paragraph (e)(3) of the final rule is being provided to allow for such situations, and is discussed further below. OSHA emphasizes that removal of a personal lockout or tagout device by another person may not be based on convenience or simple unavailability of the employee. If a lockout or tagout device is attached, it is assumed that the employee who attached that device is engaged in servicing the equipment to which the device is attached, and that person is exposed to the hazards of reenergization. Therefore, as a general matter, the protection of that employee requires that he/she have complete control over his/her lockout or tagout device. Some modification of the general rule is warranted in the case of transfer of authority between shifts, as discussed in paragraph (f)(4) below, and to a limited extent in group lockout or tagout, as discussed in paragraph (f)(3) below, both of which involve coordination of activities between servicing employees.

Under the exception to paragraph (e)(3), the employer may direct the removal of a lockout or tagout device by another employee only if the energy control program incorporates specific procedures and training for that purpose, and only where the employer can demonstrate that the alternative procedure will provide equivalent safety to having the employee remove his/her own device. The procedure must include, at a minimum, the following items: First, verification that the authorized employee is not at the facility; second, making all reasonable efforts to contact that employee to inform him/her that his/her device has been removed; and third, ensuring that employee knows of that device removal before he/she resumes work at the facility. These steps are necessary to ensure that the employee who is protected by the device is not exposed to energy hazards either at the time of its removal or afterwards.

Paragraph (f)(1) requires that the employer develop and utilize a procedure that establishes a sequence of actions to be taken in situations where energy isolating devices are locked out or tagged out and there is a need for testing or positioning of the machine or equipment or components thereof. These actions are required in order to maintain the integrity of any lockout or tagout protection for the servicing employees. It is also necessary in order to provide optimum safety coverage for employees when they have to go from a deenergized condition to an energized one and then return the system to lockout or tagout control. It is during these transition periods that employee exposure to hazards is high, and a sequence of steps to accomplish these tasks safely is needed.

Paragraph (f)(1) prescribes a logical sequence of steps to be followed in situation where energy isolating devices are locked out or tagged out, and when there is a need to test or position the machine, equipment or components thereof. The steps offer necessary protection to employees when they are involved in this activity. The procedure is clear-cut and should require little or no explanation other than the contents of the standard itself.

It should be pointed out that OSHA is allowing the removal of the lockout or tagout devices and the reenergization of the machine or equipment only during the limited time necessary for the testing or positioning of the machine, equipment or component thereof. This paragraph does not allow the employer or employee to disregard the requirement for locking out or tagging out during the other portions of the servicing or maintenance operation. This exception is only a temporary measure to be used only to accomplish a particular task for which energization is essential.

In paragraphs (f)(2) (i) and (ii), the final standard requires that whenever outside servicing personnel are engaged to perform any of the activities covered by this standard at a plant or facility, the employer at that facility must inform the authorized representatives of the servicing organizations (contractors, service representatives, etc.) of the lockout or tagout procedures used by the facility. The standard also requires the plant or facility employer to verify that the procedures to be used by outside service representatives are at least as protective of his/her employees as the procedures used in the plant or facility, and that the employees in the plant or facility understand the restrictions or prohibitions of the contractor's procedure and the energy control program of the outside servicing organizations.

These requirements are necessary when outside personnel work on machines or equipment because their activities have the same or greater potential for exposing employees to servicing hazards as would exist if the employer's own employees were performing the work. These hazards can pose a threat to both the outside service representatives and the employees in the plant or facility.

The outside servicing personnel would certainly be expected to know about the specific equipment being serviced, but they might not be familiar with the energy control procedures being used in the particular workplace. Similarly, the employees at the worksite might be familiar with the procedures being used by their own employer, but they might not know what to do if the contractor has a procedure which differs from their own. If such procedures were not coordinated, each group of employees might be endangered by the actions of the other, even if each one followed its own procedures.

This standard is intended to ensure that both the employer and the outside service personnel are aware that their interaction can be a possible source of injury to employees and that the close coordination of their activities is needed in order to reduce the likelihood of such injury. OSHA sees the proper utilization of these provisions, when they are understood and agreed upon, as a way to prevent misunderstandings by either plant employees or outside service personnel regarding the use of lockout or tagout procedures in general, and with regard to the use of specific lockout or tagout devices that are selected for a particular application.

There were several commenters (Ex. 2–3, 2–41, 2–58 and 2–67) who suggested OSHA require outside contractors to use the same procedures as used in the plant or facility that the work is being done. OSHA believes that it might adversely affect the safety of employees if the standard were to require them to comply with a procedure which is unfamiliar to them and differs from their usual practices under their own employer's energy control program. Further, by allowing each employee to use the procedure that he/she is familiar with, there is greater assurance that the employees will willingly use the procedure.

When different procedures are being used by the contractor and the facility employer, the standard requires each employer to determine the impacts of the other employer's procedure on his/her own employees, and to assure that those employees are protected as effectively under the other procedure as they would be under their own procedure. For example, if there are elements of the contractor's procedure which need to be explained to the facility employees, or if there are other steps needed to assure their safety under that procedure, the facility employer must provide these employees with adequate support and information to provide the necessary protection.

Several commenters (Ex. 2–35, 2–39, 2–40, and 2–69) recommended specifying that the plant or facility employer require compatibility of procedures. Because of the wide range of potential programs and procedures to be developed under this standard, OSHA considers that a requirement for full compatibility of procedures would be difficult, if not impossible, to implement with any degree of consistency. However, OSHA believes that if each employer provides the necessary information on his/her energy control procedure to the other employer whose employees are affected by that procedure, both employers will be able to evaluate the different procedures and determine what information needs to be provided to their respective employees. Accordingly, paragraph (f)(3) of the Final Rule requires that the plant or facility manager inform the outside contractor about the lockout or tagout procedures used in the facility; that the plant or facility employer assure that the contractor's procedure provide equivalent protection to the plant employees; and that the employees in the facility understand and comply with the instruction and prohibition of the procedures.

The requirement for coordination between the contractor and the on-site employer is intended to deal with the potential for either one's employees to create or compound the hazards to which the other's employees are exposed. Regardless of the degree of coordination required by paragraph (f)(2), each covered employer, whether contractor or on-site employer, has an independent obligation under the OSHA Act to provide the protection under the standard for his/her own employees.

The facility owner must look at various aspects of the contractor's energy control program to assure that his/her employees are not placed at an increased risk. For example, is the contractor's means of notifying the affected employees of the pending lockout or tagout as thorough as the facility employer's? Is the procedure for identifying the energy isolating devices as exhaustive or complete as the facility employer's? Is the method of lockout or tagout used by the contractor recognized and respected by the facility's employees? Does the contractor's procedure take into account the possibility of reaccumulation of stored energy (if that is a potential problem)? Does the contractor's procedure for removal of lockout or tagout devices and reenergization and startup of the machine or equipment provide for employee notification and ensuring the equipment is safe before startup? If any of the steps in the contractor's procedures fail to cover significant or essential conditions of the workplace which could adversely affect the safety of the facility employees, action must be taken by the facility employer to minimize the potential for injury to his/her employees.

Proposed paragraph (f)(3) contained a series of provisions dealing with group lockout. In brief, group lockout involves the performance of servicing or maintenance activities when more than one employee is engaged in the servicing operation, using a group lockout device, with an authorized employee directly responsible for the performance of the overall servicing. The proposed requirement for group lockout specified that the authorized employee would have a primary lock, which is affixed when the equipment is deenergized, and is removed when the job is completed. It did not provide for the use of individual locks or tags by the individual employees in the group. The proposal would have allowed this system, with the authorized employee being responsible for the safety of all the employees in the group, if that program provided the same degree of safety as personal lockout or tagout.

Based on the record (Ex. 2–27, 2–29, 2–32, 2–44, 2–63, 2–99, 2–106, 51, 56, 60, Tr. pg. W1–142), OSHA has reexamined the issue of group lockout and has concluded that an additional element is necessary for the safety of the servicing employees: each employee in the group needs to be able to affix his/her personal lockout or tagout system device as part of the group lockout. This is necessary for several reasons: first, the placement of a personnal lockout or tagout system device enable that employee to have a degree of control over his/her own protection, rather than having to depend completely upon other people; second, the use of a personal device will enable each servicing employee to verify that the equipment has been properly deenergized in accordance with the energy control procedure, and to affix his/her device to indicate that verification; third, the presence of an employee's lockout or tagout system device will inform all other persons, including the other servicing employees and supervisors, that the employee is still working on the equipment; fourth, as long as that device remains attached, the authorized person in charge of the group lockout or tagout knows that the job is not completed and that it is not safe to reenergize the equipment; and, fifth, the servicing employee will continue to be protected by the presence of his/her device until he/she removes it. The authorized employee in charge of the group lockout or tagout does not remove the group lockout device until each employee in the group has removed his/her personal device, indicating that employees are no longer exposed to the hazards from the servicing operation. OSHA is convinced that the use of individual lockout or tagout system devices to supplement the group lockout device is necessary for the safety of the servicing employees.

The proposed rule contained several general elements for group lockout, including provision on primary responsibility and coordination of work forces. These elements are carried forward in the Final Rule. The requirement for the use of personal lockout or tagout devices will only enhance the overall effectiveness of these provisions, because the authorized employee in charge of the group lockout will be better able to evaluate the status of the servicing operation, as well as to determine which, if any, of the servicing employees are working on the equipment at a particular time.

OSHA requires in paragraph (f)(3) that when a crew, craft, department or other *group* lockout or tagout device is used, it must provide the authorized and affected employees with a degree of protection that is equivalent to the use of *personal* lockout or tagout procedures. As in the case of other forms of lockout or tagout protection, the employer who uses a group lockout or tagout system must develop a procedure which encompasses the elements set forth in paragraph (c)(4).

Paragraph (f)(3) identifies requires several key provisions which must be included in all group lockout or tagout procedures. If a single lockout device or set of lockout devices (often referred to as "operations locks") are utilized to isolate the machine or equipment from the energy sources, each authorized employee is afforded a means to utilize his/her personal lockout or tagout devices so that no single employee has control of the means to remove the group lockout or tagout devices while employees are still servicing or maintaining the machine or equipment. This can be accomplished by the use of a lockout or other similar appliance. Once the machine or equipment is locked out, the key is placed into the lockbox and each authorized employee places his/her lockout or tagout device on the box. When each individual completes his/her portion of the work, that person removes his/her lockout or tagout device from the lockbox. Once all personal lockout or tagout devices have been removed, the key for the group lockout devices for the machine or equipment can be used to remove that group lockout device. This method provides protection for all employees working under the protection of a particular group lockout or tagout device. When more than one group is involved, another authorized person might need to maintain responsibility for coordination of the various lockout control groups in order to ensure continuity of protection and to coordinate workforces.

In addition to designating and assigning responsibility to authorized employees, paragraph (f)(3) requires the employer to develop and implement procedures for determining the exposure status of individual crew members and for taking appropriate measures to control or limit that exposure.

These provisions are seen by OSHA as requiring at least the following steps:

1. Verification of shutdown and isolation of the equipment or process before allowing a crew member to place a personal lockout or tagout device on an energy isolating device, or on a lockout box, board, or cabinet;

2. Ensuring that all employees in the crew have completed their assignments, removed their lockout and/or tagout devices from the energy isolating device, the box lid or other device used, and are in the clear before turning the equipment or process over to the operating personnel or simply turning the machine or equipment on.

3. Providing the necessary coordinating procedures for ensuring the safe transfer of lockout or tagout control devices between other groups and work shifts.

The special coverage of paragraph (f)(3) recognizes the importance of group lockout and/or tagout devices used under conditions in which the safety of all employees working in the group is dependent on how those devices are used. For that reason, it involves a closer examination of the conditions, methods and procedures needed for effective employee protection.

OSHA also believes that by requiring each servicing employee to attach his/her own device in group servicing operations, it becomes possible to extend coverage of group servicing activities under paragraph (f)(3) beyond lockout, as envisioned by the proposal, to cover tagout, as well. This would primarily involve equipment which has not been designed to accept a lockout device. OSHA believes that when a group lockout or tagout procedure is properly implemented, it adds an additional element of protection to servicing employees: the authorized employee in charge of the group servicing operation applies a group lockout or tagout device to the equipment being serviced, and each servicing employee attaches a personal lockout or tagout device to the group device. These individual devices are removed by the employees who applied them, leaving the group device attached. These employees, by clearing the equipment and removing their own devices, indicate that they are no longer exposed to the hazards of the servicing operation. The authorized employee in charge of the group servicing operation then verifies that all elements of the group servicing have, in fact, been completed, and that it is safe to reenergize the system, before he/she removes the group device. Thus, the additional step provides further assurance that reenergizing the equipment will not endanger employees. Expanding group procedures to encompass tagout as well as lockout will extend the additional protection to operations which would otherwise be permitted under this standard to use tagout devices instead of lockout.

One of the most difficult problems to be dealt with by this standard involves the servicing and maintenance of complex equipment, particularly when the work extends across several workshifts. Under the basic approach taken by this standard, each servicing employee is responsible for the application and removal of his/her own lockout or tagout device. However, the record indicates that the servicing of some complex equipment may take days or weeks, and that in some cases, hundreds of lockout or tagout devices may be necessary. EEI (Ex. 56) noted that in some major maintenance operations, it can take a day or more just to apply lockout/tagout devices to all energy isolating devices. CMA (Ex. 56) explained that in a chemical plant, certain "turn-around" jobs may require the locking or tagging of a hundred or more energy isolation devices and require 25 or more employees to perform the servicing.

Paragraph (f)(4) of this Final Rule requires that specific procedures be utilized to ensure continuation of lockout or tagout protection for employees during shift or personnel changes in order to provide for an orderly transfer of control measures, and to be certain that the machine or equipment is continuously maintained in a safe condition. As with group lockout or tagout, this task is accomplished as part of the procedures that are defined in performance language in paragraph (c)(4). Paragraph (f)(4) requires specific procedures whenever transfer of control measures is necessary. The underlying rationale for these provisions, whereby hazardous energy control responsibility is transferred, is for the maintenance of uninterrupted protection for the employees involved. It is therefore considered essential that lockout or tagout devices be maintained on energy isolating devices throughout the transition period.

Basically, the transfer of responsibility can be accomplished by the on-coming shift employees accepting control of the system involved prior to the release of control by the off-going employees. Also, the procedures, whether they necessitate the use of simple control measures or the more

detailed use of logs and check lists to accomplish an orderly transfer, are to be followed by an assurance that the system is indeed safe for employees to continue working. This assurance involves action by the authorized or supervisory employee responsible for the transfer to verify the continued isolation of energy in the system.

There was considerable discussion at the hearings with regard to proposed paragraph (f)(4), concerning the need to ensure continued protection during shift or personnel changes. This paragraph was intended to provide protection for servicing operations which extend over more than one shift, usually involving from a few to large numbers of employees on each shift. OSHA attempted to provide a means of assuring that there is no gap in coverage between the off-going employee's removal of his/her lockout or tagout device and the on-coming employee's attachment of his/her own device. Several participants at the hearings testified as to methods used in their facilities to deal with this situation. EEI, for example, (Tr. pg. W2-22-2-26) testified that for complex jobs involving large numbers of energy control devices and many employees on different shifts, member companies use work permits which must be reauthorized at the beginning of each shift. The lockout/tagout devices which are attached to the energy control means at the start of the job are not removed between shifts. Before beginning work, the on-coming shift employees walk through the equipment and verify that the equipment has been deenergized and that proper procedures have been followed. Another system, involving an "operations lock," was endorsed by representatives of API (Ex. 57, Tr. pg. H 40) and OCAW (Tr. pg. H69–70). An "operations lock," essentially a type of group lockout device, is the first lock attached to the equipment when the equipment is deenergized, and it is the last lock removed when the job is completed. Each servicing employee attaches his/her personal lockout/tagout device while working on the equipment, and removes the device when the job is completed, or when leaving for the day. OSHA believes that when properly implemented, either of these methods can provide adequate assurance to the on-coming employee that the equipment is safe to work on.

Perhaps the most critical element of assuring continuity of protection is providing the individual employee with an opportunity to verify that the equipment has been deenergized. Even more than in the case with individual lockout or tagout, the on-coming employee should not have to depend on the actions of another employee or supervisor, particularly one who has left the workplace for the day, for assurance that it is safe to work on the machinery or equipment. The group lockout provisions in paragraph (f)(4) of the Final Rule contain what OSHA believes to be the necessary safeguards for these situations. To the extent that the procedures described by EEI, API, and OCAW provide for individual verification that the equipment has been properly deenergized, and to the extent that the procedures allow for the servicing employee to attest to that verification in accordance with the standard, OSHA believes that such procedures would comply wth the Final Rule. In the case of the type of complex servicing operation described by EEI, involving large numbers of energy isolation devices, large numbers of servicing employees, and multiple shifts, OSHA acknowledges that the removal and replacement of the lockout/tagout devices each shift could be overly burdensome. In these situations, the use of the work permit, with each employee signing on and off the equipment, combined with the employees walking down the equipment to ensure continued deenergization prior to beginning work, would be an acceptable approach to compliance with group lockout/tagout and shift transfer provisions of the standard.

Because the person applying the lockout or tagout device is generally the one being protected by that device, it is essential that the device not be removed by anyone else except in emergencies. When an employee transfers servicing duties to an employee on the next shift, and the equipment is to remain deenergized throughout the shift change, it should not be an undue burden to establish a procedure under paragraph (f)(4) for the off-going employee to transfer his/her authority to the on-coming employee. In situations where the off-going employee removes his/her lockout or tagout device before the on-coming employee arrives, the procedure could allow for the off-going employee to apply a tagout device at the time he/she removes his/her device, indicating that the lock had been removed, but that the machine or equipment had not been reenergized. The on-coming employee would verify that the system was still deenergized, and would remove the interim tag and substitute his/her lockout device. This would assure that the continuous protection is maintained from one shift to another. When tagout devices are used, it would be possible to use a tag with space for the off-going employee to sign off, giving the date and time, and for the on-coming employee to sign on, also giving the date and time. Each employee would verify the deenergization and energy isolation for his/her own protection before signing onto the tag.

VII. Regulatory Impact Analysis

Introduction

Executive Order 12291 (46 FR 13193, February 17, 1981) requires that a regulatory analysis be conducted for any rule potentially having major economic consequences on the national economy, geographical regions, individual industries, or levels of government. Consistent with these requirements, (OSHA) has prepared a Regulatory Impact Analysis (RIA) for this Final Rule. The analysis includes: A profile of the potentially affected firms and employees; a description of regulatory and nonregulatory alternatives; an analysis of the technological feasibility of the rule; and a study of the potential social benefits, economic costs, and environmental impacts that may result from full compliance with the rule.

The complete analysis, as summarized in this section, is based on data and information provided by the Eastern Research Group (ERG) in a study entitled, "Industry Profile Study of a Standard for Control of Hazardous Energy Sources Including Lockout/Tagout Procedures" [Ex. 15]. Additional information was obtained from comments submitted to OSHA in response to the proposed rule and a supplemental ERG report [Ex. 21].

The Secretary has determined that this action is a "major action" as defined by section 3(b) of Executive Order 12291 as it will have an annual effect on the economy of $100 million or more. The Regulatory Impact Analysis is available for inspection and copying in the rulemaking docket.

Affected Industries

The Final Rule will affect most employment covered by OSHA under Part 1910 except: (1) Those activities that are specifically excluded from coverage such as certain work on plug and cord type electrical equipment; and (2) employment for which OSHA has or is in the process of providing separate coverage under a different Subpart or Part, such as the oil and gas field services industry. OSHA has estimated that the rule will affect activities in some 1.7 million establishments employing approximately 39 million workers.

To analyze the differing effects of the rule, OSHA has divided the affected industries into a high-impact group, a low-impact group, and a zero or negligible-impact group. The high-impact group consists of all manufacturing industries. In 1984, approximately 20 million workers were employed in 340,451 high-impact establishments.

Firms classified as low-impact include those in transportation; utilities; wholesale trade; retail food stores; and several service industries, including personal services, business services, automotive repair, miscellaneous repair, and amusement services. OSHA has estimated that approximately 19 million workers were employed in 1.4 million low-impact establishments in 1984.

The negligible-impact group consists of industries that ERG determined had little potential for a lockout or tagout-related accident. Retail trade, finance, insurance, real estate, service, and public administration firms not classified in the high or low-impact sectors were included in this group.

The Agency's analysis focuses on the potential regulatory effects to high- and low-impact firms.

Population at Risk

As noted, some 39 million workers are employed in industries that may be affected by the Final Rule. All such workers have the potential for being injured due to inadequate or nonexistent use of lockout or tagout. In estimating the number of workers at risk from exposure to hazardous energy, OSHA classified "at-risk" occupations in the Final Rule as those being held by individuals who would actually perform lockout or tagout activities. Although this approach tends to underestimate the number of workers who could benefit from promulgation of a lockout or tagout rule, it does provide a good measure of the number of workers who will have to alter their work patterns to comply with the rule. Thus, it is an appropriate method for estimating the costs of the rule. Based on the ERG study [Ex. 15, p. 3–35], OSHA has determined that two million workers in high-impact industries, and one million workers in low-impact industries, are employed in occupations where the unexpected energization or start-up of machines or equipment or release of stored energy could cause injury to employees. The risk appears to be the greatest for those workers employed as craft workers, machine operators, and laborers. Certain types of machinery, such as packaging and wrapping equipment, along with printing presses and conveyors, are associated with a high proportion of the accidents.

Significance of Risk

The installation, assembly, service, repair, maintenance, change over, and disassembly of machines, equipment, and systems are activities integral to most industrial processes. During these activities, however, accidents often result from the inadvertent energization or movement of machinery or equipment.

The ERG study [Ex. 15, p. 6–27, 6–48] estimated that two percent of all workplace injuries, and 7.1 percent of all fatal occupational accidents, occur as a result of inadequate or nonexistent lockout or tagout procedures in industries regulated under this Final Rule. Based on these percentages, the Agency has estimated that in 1984 there were 144 fatalities, 33,432 lost workday injuries, and 37,561 non-lost workday injuries that occurred due to inadequate lockout or tagout procedures in the affected industries. Assuming that these types of accidents grow proportionately with the average level of employment, approximately 1,530 fatalities, 352,965 lost workday injuries, and 396,560 non-lost workday injuries would occur during the next 10 years in the absence of a lockout or tagout standard.

The accidents commonly resulting from inadequate or nonexistent lockout or tagout activities tend to be significantly more severe that the average occupational injury. Injuries typically include fractures, lacerations, contusions, amputations, and puncture wounds. The ERG study [Ex. 15, p. 6–52] estimated that such injuries cause workers to lose an average of 24 workdays. By way of comparison, the 1981 Bureau of Labor Statistics' Occupational Injuries and Illnesses Study [Ex. 18] reports that the average lost time occupational injury involves 16 lost workdays.

Based upon the aforementioned evidence, OSHA has determined that the failure to control hazardous energy results in a significant risk to employees. Since the private market fails to provide an adequate level of safety for workers servicing and maintaining equipment, the Agency has examined various regulatory and nonregulatory alternatives, including tort litigation, distribution of information, workers' compensation, and industry self-regulation. The Agency has concluded that the standard would reduce risk in an optimal manner.

Technological Feasibility

The Final Rule is written in performance-based language that permits firms to develop lockout or tagout procedures that are most appropriate for their specific machines and equipment. Based on data gathered during ERG site visits, OSHA has determined that some firms of all sizes and types are already in full compliance with the Final Rule. As this rule would not require the development of new technologies or significant equipment modifications, OSHA has determined that all provisions of the standard are technologically feasible.

Costs of Compliance with the Rule

OSHA has estimated the cost of full compliance with the standard based on the most cost-effective methods of implementing the Final Rule. The Agency estimates that 72.5 percent of all energy isolating devices are lockable (90 percent of the electrical disconnects and 66.7 percent of the valves) and will be locked out under the Final Rule, while the remaining 27.5 percent are not lockable and will be tagged out. Thus, the Agency has concluded that promulgation of the rule will cost 631,000 establishments a total of $214.3 million during the first year of implementation and $135.4 million in subsequent years.

The costs of complying with the standard can be briefly summarized by category. For locks, tags, and other hardware, the first-year cost is estimated to be $18.5 million, and the annual recurring costs amount to $8.9 million. For voluntary equipment modification to facilitate lockout or tagout, the first-year cost is estimated at $27.0 million, with no annual recurring costs. In terms of work practice modifications, the first-year cost and the annual recurring costs are $102.7 million each. For planning and implementing lockout or tagout procedures, the first-year cost is calculated at $35.2 million, and the annual recurring costs are estimated at $21.0 million. For employee training, the first-year cost is $31.0 million, and the annual recurring costs are $3.6 million.

OSHA also has estimated the average costs per establishment for firms not currently using adequate lockout or tagout procedures. First-year compliance costs for establishments in manufacturing industries, which are classified as high-impact firms, would range from $120 per firm for very small establishments (those having less than 20 employees) to $28,172 for large establishments (those having more than 250 employees). Industries categorized as low-impact would incur first-year costs of approximately $169 per firm. First-year costs of the standard by SIC code for the high and low-impact industries are summarized in Table XXIV.

Table XXIV.—First Year Cost of the Standard for the Control of Hazardous Energy Sources by SIC

[millions $]

SIC code	Industry name	Cost
	High impact industries	
20	Food and kindred products	10.8
21	Tobacco manufacturers	0.5
22	Textile mill products	7.2
23	Apparel and other finished products	2.0
24	Lumber and wood products, except furniture	3.6
25	Furniture and fixtures	2.4
26	Paper and allied products	5.9
27	Printing, publishing, and allied industries	14.1
28	Chemicals and allied products	8.2
29	Petroleum, refining, and related industries	1.4
30	Rubber and miscellaneous plastics products	6.0
31	Leather and leather products	1.1
32	Stone, clay, glass, and concrete products	4.1
33	Primary metal industries	10.1
34	Fabricated metal products, except machinery and transportation equipment	13.3
35	Machinery, except electrical	18.1
36	Electrical and electronic machinery, equipment, and supplies	13.3
37	Transportation equipment	14.9
38	Measuring, analyzing, and controlling instruments	2.9
39	Miscellaneous manufacturing industries	2.3
	Low impact industries	
Div. E	Transportation	9.5
Div. E	Communications	23.7
Div. E	Utilities	4.4
Div. F	Wholesale trade	13.7
Div. G	Retail trade	1.2
Div. I	Services	19.0
Total cost to high and low impact industries.		*214.3

* Total may not add due to rounding.

Benefits of the Final Rule

OSHA has estimated the total number of accidents that the Final Rule would have prevented in 1984, assuming full compliance by all affected firms and workers. As as conservative estimate, the Agency assumed that only 85 percent of those accidents identified as caused by inadequate or nonexistent lockout or tagout procedures would actually be prevented under this rule. It was assumed that 15 percent of the noted accidents may still occur even if both employees and employers are complying fully with the rule (e.g., a block used to hold the weight of a suspended machine component may fail). Based on the above assumptions, OSHA has estimated that the Final Rule would have prevented approximately 122 fatalities, 28,416 lost workday injuries, and 31,926 non lost workday injuries in 1984.

Cost-Effectiveness

OSHA has calculated the cost per fatality avoided by the standard as one measure of its efficacy. Overall, for both low-impact and high-impact industries, the compliance costs of the standard are estimated to amount to about $1.2 million per fatality avoided. If compliance costs are further adjusted to reflect the additional economic benefits expected to accrue to employers (e.g., less lost production time, less administrative preparing insurance claims and accident reports, and less inefficiency related to replacing injured workers), the cost per fatality avoided falls to $0.19 million. However, this calculation only includes fatalities, and does not take into account the costs or benefits for the avoidance of employee injuries. If injuries were included in the calculations, cost per injury prevented would be extremely low. Thus, the Agency has concluded that the lockout or tagout rule will reduce the number of occupational fatalities and injuries in a cost-effective manner.

Economic Effects

OSHA has determined that full compliance with the standard will have a minor negative impact on the profits of the affected firms because, on average, compliance costs will equal no more than 0.05 percent of operating costs and 2.2 percent of net income for any size establishment. Neither the gross national product (GNP), the level of international trade, the price of consumer goods, nor the level of employment will be significantly affected. Based on these estimates, the Agency has concluded that the economic effects of the rule will be negligible, and thus neither the stability nor the profitability of any particular industry or size firm will be at issue as a consequence of the promulgation of the final standard.

VIII. Regulatory Flexibility Certification

In accordance with the Regulatory Flexibility Act of 1980 (5 U.S.C. 601 et seq.), OSHA must assess the potential economic impact of its standards to determine whether they will impose significant costs upon a substantial number of small entities. "Significance" is determined by the impact upon small firms' profits, market share, and financial viability. In particular, OSHA must determine whether its rules will have a relatively greater negative effect on small entities than on large entities.

To assess the impact of this rule on small entities, the Agency has estimated the total cost of compliance per establishment for firms not currently practicing lockout or tagout. First-year costs would range from $120 for very small firms (those having fewer than 20 employees; to $1,737 for small firms (those having 20 to 99 employees) to $28,172 for large firms (those having 250 employees or more) [Ex. No. 17, p. VI–43]. The cost of compiling with the Final Rule will depend primarily on the number of workers employed by a firm and the number of maintenance and servicing tasks required annually—factors that typically depend upon the scale of operation of a company. Thus, based on the above estimates, the costs of the Final Rule will be proportional to the size of the firm and no significant differential impact is expected.

OSHA also has compared the costs of compliance with small entities' total costs of production. The Agency has determined that the cost of full compliance with the rule will equal no more than 0.05 percent of an average small or very small firm's operating costs, and no more than 2.2 percent of an average small firm's net income [Ex. 17, p. VII–6].

As the costs of compliance for small and very small firms are proportional to the size of the firm, and would represent such a small component of the overall cost of the facilities, OSHA certifies that the Final Rule will not have a significant impact upon a substantial number of small entities. The Regulatory Flexibility Assessment of this rule is available for inspection and copying in the rulemaking docket.

IX. Environmental Assessment

This Final Rule has been reviewed in accordance with the requirements of the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. 4321 et seq.), the Guidelines of the Council on Environmental Quality (CEQ) (40 CFR part 1500), and Department of Labor NEPA Procedures (29 CFR part 11). As a result of this review, the Acting Assistant Secretary for OSHA has determined that the rule will have no significant environmental impact.

The Final Rule focuses on the reduction of accidents and injuries by means of the utilization of specific work practices, procedures, and training. This proposal would not have an impact on air, water, or soil quality, plant or animal life, the use of land, or any other aspects of the environment. As such,

BEST COPY AVAILABLE

this proposal can therefore be categorized as an excluded action according to subpart B, § 11.10, of the DOL NEPA regulations.

X. Paperwork Reduction Act

This section contains a collection of information requirements in paragraphs § 1910.147(c)(4), (c)(7) and (f)(2) which pertain to the development and utilization of a written energy control procedure and the training of employees in that procedure. The paperwork requirements contained in this rule will be submitted to the Office of Management and Budget (OMB) for approval.

XI. International Trade

Increases in the price of domestically manufactured goods in general result in an increase in the demand for imports, and a decrease in the demand for exports. The magnitude of this impact depends on the relevant demand elasticities and the magnitude of the price changes. While the final standard may result in slightly higher prices of manufactured goods, the estimated magnitude of this increase is so small that the Agency has concluded that any resultant impact on foreign trade will be negligible.

XII. Federalism

This Final Rule has been reviewed in accordance with Executive Order 12612 (52 FR 41685, October 30, 1987), regarding Federalism. This Order requires that agencies, to the extent possible, refrain from limiting State policy options, consult with States prior to taking any actions which would restrict State policy options, and take such actions only when there is clear constitutional authority and the presence of a problem of national scope. The Order provides for preemption of State law only if there is a clear Congressional intent for the Agency to do so. Any such preemption is to be limited to the extent possible.

Section 18 of the Occupational Safety and Health Act (OSH Act) expresses Congress' clear intent to preempt State laws relating to issues on which Federal OSHA has promulgated occupational safety and health standards. Under the OSH Act, a State can avoid preemption only if it submits, and obtains Federal approval of, a plan for the development of such standards and their enforcement. Occupational safety and health standards developed by such Plan-States must, among other things, be at least as effective in providing safe and healthful employment and places of employment as the Federal standards. Where such standards are applicable to products distributed or used in interstate commerce, they may not unduly burden commerce and must be justified by compelling local conditions (see section 18(c)(2) of the OSH Act).

The Federal standard on control of hazardous energy sources addresses hazards which are not unique to any one State or region of the country. Nonetheless, States with occupational safety and health plans approved under Section 18 of the OSH Act will be able to develop their own State standards to deal with any special problems which might be encountered in a particular State. Moreover, because this standard is written in general, performance-oriented terms, there is considerable flexibility for State plans to require, and for affected employers to use, methods of compliance which are appropriate to the working conditions covered by the standard.

In brief, this Final Rule addresses a clear national problem related to occupational safety and health in general industry. Those States which have elected to participate under Section 18 of the OSH Act are not preempted by this standard, and will be able to deal with any special conditions within the framework of the Federal Act, while ensuring that the State standards are at least as effective as that standard.

XIII. State Plan Standards

The 25 States and territories with their own OSHA-approved occupational safety and health plans must adopt a comparable standard within six months of the publication date of the final standard. These States and territories are: Alaska, Arizona, California, Connecticut (for State and local government employees only), Hawaii, Indiana, Iowa, Kentucky, Maryland, Michigan, Minnesota, Nevada, New Mexico, New York (for state and local government employees only), North Carolina, Oregon, Puerto Rico, South Carolina, Tennessee, Utah, Vermont, Virginia, Virgin Islands, Washington, and Wyoming. Until such time as a State standard is promulgated, Federal OSHA will provide interim enforcement assistance, as appropriate, in these States.

XIV. Effective Date

In developing the Final Rule, OSHA has considered whether a delayed effective data is necessary for any of the provisions of the standard. Since the Final Rule does not require extensive retrofitting or major modifications of existing equipment, the Agency believes that 60 days is adequate time for employers to obtain the necessary hardware (primarily lockout and tagout devices). This amount of time should also be adequate for the development of the energy control program and procedures required by the standard. The record indicates that many industries with highly complex equipment, such as the automotive, chemical, and petroleum industries, have already implemented lockout or tagout procedures which would need to be modified little, if at all, to meet the standard. For those employers who will need to develop new procedures to comply with the standard, the standard provides considerable guidance to assist in that development process. Appendix A to the Final Rule sets forth an example of a simple procedure which can be tailored to the individual workplace in situations involving a single energy source. OSHA believes that many employers, particularly small businesses, will be able to use this procedure by filling in the blanks with the necessary information. For more complex situations, a more complex procedure may be necessary. During this rulemaking, interested parties submitted a wide range of procedures and information on their implementation to the rulemaking record, and these materials are available for review and copying in OSHA's Docket Office.

XV. List of Subjects in 29 CFR Part 1910 1910

Lockout; Tagout; Control of hazardous energy sources; Deenergize; Training; Occupational safety and health; Occupational Safety and Health Administration; Safety.

XVI. Authority

This document was prepared under the direction of Alan C. McMillan, Acting Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor 200 Constitution Ave., NW., Washington, DC 20210.

Accordingly, pursuant to sections 4, 6(b), 8(c) and 8(g) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657), Secretary of Labor's Order No. 9–83 (48 FR 35736), and 29 CFR part 1911, 29 part 1910 is hereby amended as set forth below.

Signed at Washington, D.C., this 28th day of August 1989.

Alan C. McMillan,

Acting Assistant Secretary of Labor.

29 CFR Part 1910 is amended as follows:

PART 1910—OCCUPATIONAL SAFETY AND HEALTH STANDARDS

1. The authority citation for Subpart J of Part 1910 is revised to read as follows:

Authority: Section 4, 6 and 8, Occupational Safety and Health Act of 1970, 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754) 8–76 (41 FR 25059) or 9–83 (48 FR 35736), as applicable. Sections 1910.141, 1910.142 and 1910.147 also issued under 29 CFR part 1911.

§ 1910.150 [Redesignated From 1910.147]

2. Section 1910.147 is redesignated as § 1910.150.

3. A new § 1910.147 and Appendix to § 1910.147 are added to read as follows:

§ 1910.147 The control of hazardous energy (lockout/tagout).

(a) *Scope, application and purpose*—(1) *Scope.*

(i) This standard covers the servicing and maintenance of machines and equipment in which the *unexpected* energization or start up of the machines or equipment, or release of stored energy could cause injury to employees. This standard establishes minimum performance requirements for the control of such hazardous energy.

(ii) This standard does not cover the following:

(A) Construction, agriculture and maritime employment;

(B) Installations under the exclusive control of electric utilities for the purpose of power generation, transmission and distribution, including related equipment for communication or metering; and

(C) Exposure to electrical hazards from work on, near, or with conductors or equipment in electric utilization installations, which is covered by Subpart S of this part; and

(D) Oil and gas well drilling and servicing.

(2) *Application.* (i) This standard applies to the control of energy during servicing and/or maintenance of machines and equipment.

(ii) Normal production operations are not covered by this standard (See Subpart 0 of this Part). Servicing and/or maintenance which takes place during normal production operations is covered by this standard only if;:

(A) An employee is required to remove or bypass a guard or other safety device; or

(B) An employee is required to place any part of his or her body into an area on a machine or piece of equipment where work is actually performed upon the material being processed (point of operation) or where an associated danger zone exists during a machine operating cycle.

Note: *Exception to paragraph (a)(2)(ii):* Minor tool changes and adjustments, and other minor servicing activities, which take place during normal production operations, are not covered by this standard if they are routine, repetitive, and integral to the use of the equipment for production, provided that the work is performed using alternative measures which provide effective protection (See Subpart 0 of this Part).

(iii) This standard does not apply to the following.

(A) Work on cord and plug connected electric equipment for which exposure to the hazards of unexpected energization or start up of the equipment is controlled by the unplugging of the equipment from the energy source and by the plug being under the exclusive control of the employee performing the servicing or maintenance.

(B) Hot tap operations involving transmission and distribution systems for substances such as gas, steam, water or petroleum products when they are performed on pressurized pipelines, provided that the employer demonstrates that (*1*) continuity of service is essential; (*2*) shutdown of the system is impractical; and (*3*) documented procedures are followed, and special equipment is used which will provide proven effective protection for employees.

(3) *Purpose.* (i) This section requires employers to establish a program and utilize procedures for affixing appropriate lockout devices or tagout devices to energy isolating devices, and to otherwise disable machines or equipment to prevent unexpected energization, start-up or release of stored energy in order to prevent injury to employees.

(ii) When other standards in this part require the use of lockout or tagout, they shall be used end supplemented by the procedural and training requirements of this section.

(b) *Definitions applicable to this section.*

Affected employee. An employee whose job requires him/her to operate or use a machine or equipment on which servicing or maintenance is being performed under lockout or tagout, or whose job requires him/her to work in an area in which such servicing or maintenance is being performed.

Authorized employee. A person who locks or implements a tagout system procdure on machines or equipment to perform the servicing or maintenance on that machine or equipment. An authorized employee and an affected employee may be the same person when the affected employee's duties also include performing maintenance or service on a machine or equipment which must be locked or a tagout system implemented.

"Capable of being locked out." An energy isolating device will be considered to be capable of being locked out either if it is designed with a hasp or other attachment or integral part to which, or through which, a lock can be affixed, or if it has a locking mechanism built into it. Other energy isolating devices will also be considered to be capable of being locked out, if lockout can be achieved without the need to dismantle, rebuild, or replace the energy isolating device or permanently alter its energy control capability.

Energized. Connected to an energy source or containing residual or stored energy.

Energy isolating device. A mechanical device that physically prevents the transmission or release or energy, including but not limited to the following: A manually operated electrical circuit breaker; a disconnect switch; a manually operated switch by which the conductors of a circuit can be disconnected from all ungrounded supply conuctors and, in addition, no pole can be operated independently; a slide gate; a slip blind; a line valve; a block; and any similar device used to block or isolate energy. The term does not include a push button, selector switch, and other control circuit type devices.

Energy source. Any source of electrical, mechanical, hydraulic, pneumatic, chemical, thermal, or other energy.

Hot tap. A procedure used in the repair, maintenance and services activities which involves welding on a piece of equipment (pipelines, vessels or tanks) under pressure, in order to install connections or appurtenances. It is commonly used to replace or add sections of pipeline without the interruption of service for air, gas, water, steam, and petrochemical distribution systems.

Lockout. The placement of a lockout device on an energy isolating device, in accordance with an established procedure, ensuring that the energy isolating device and the equipment being controlled cannot be operated until the lockout device is removed.

Lockout device. A device that utilizes a positive means such as a lock, either key or combination type, to hold an energy isolating device in the safe position and prevent the energizing of a machine or equipment.

Normal production operations. The utilization of a machine or equipment to perform its intended production function.

Servicing and/or maintenance. Workplace activities such as constructing, installing, setting up, adjusting, inspecting, modifying, and maintaining and/or servicing machines or equipment. These activities include lubrication, cleaning or unjamming of machines or equipment and making adjustments or tool changes, where the employee may be exposed to the *unexpected* energization or startup of the equipment or release of hazardous energy.

Setting up. Any work performed to prepare a machine or equipment to perform its normal production operation.

Tagout. The placement of a tagout device on an energy isolating device, in accordance with an established procedure, to indicate that the energy isolating device and the equipment being controlled may not be operated until the tagout device is removed.

Tagout device. A prominent warning device, such as a tag and a means of attachment, which can be securely fastened to an energy isolating device in accordance with an established procedure, to indicate that the energy isolating device and the equipment being controlled may not be operated until the tagout device is removed.

(c) *General*—(1) *Energy control program.* The employer shall establish a program consisting of an energy control procedure and employee training to ensure that before any employee performs any servicing or maintenance on a machine or equipment where the unexpected energizing, start up or release of stored energy could occur and cause injury, the machine or equipment shall be isolated, and rendered inoperative, in accordance with paragraph (c)(4) of this section.

(2) *Lockout/tagout.* (i) If an energy isolating device is not capable of being locked out, the employer's energy control program under paragraph (c)(1) of this section shall utilize a tagout system.

(ii) If an energy isolating device is capable of being locked out, the employer's energy control program under paragraph (c)(1) of this section shall utilize lockout, unless the employer can demonstrate that the utilization of a tagout system will provide full employee protection as set forth in paragraph (c)(3) of this section.

(iii) After October 31, 1989, whenever major replacement, repair, renovation or modification of machines or equipment is performed, and whenever new machines or equipment are installed, energy isolating devices for such machines or equipment shall be designed to accept a lockout device.

(3) *Full employee protection.* (i) When a tagout device is used on an energy isolating device which is capable of being locked out, the tagout device shall be attached at the same location that the lockout device would have been attached, and the employer shall demonstrate that the tagout program will provide a level of safety equivalent to that obtained by using a lockout program.

(ii) In demonstrating that a level of safety is achieved in the tagout program which is equivalent to the level of safety obtained by using a lockout program, the employer shall demonstrate full compliance with all tagout-related provisions of this standard together with such additional elements as are necessary to provide the equivalent safety available from the use of a lockout device. Additional means to be considered as part of the demonstration of full employee protection shall include the implementation of additional safety measures such as the removal of an isolating circuit element, blocking of a controlling switch, opening of an extra disconnecting device, or the removal of a valve handle to reduce the likelihood of inadvertent energization.

(4) *Energy control procedure.* (i) Procedures shall be developed, documented and utilized for the control of potentially hazardous energy when employees are engaged in the activities covered by this section.

Note: *Exception:* The employer need not document the required procedure for a particular machine or equipment, when all of the following elements exist: (1) The machine or equipment has no potential for stored or residual energy or reaccumulation of stored energy after shut down which could endanger employees; (2) the machine or equipment has a single energy source which can be readily identified and isolated; (3) the isolation and locking out of that energy source will completely deenergize and deactivate the machine or equipment; (4) the machine or equipment is isolated from that energy source and locked out during servicing or maintenance; (5) a single lockout device will achieve a locked-out condition; (6) the lockout device is under the exclusive control of the authorized employee performing the servicing or maintenance; (7) the servicing or maintenance does not create hazards for other employees; and (8) the employer, in utilizing this exception, has had no accidents involving the unexpected activation or reenergization of the machine or equipment during servicing or maintenance.

(ii) The procedures shall clearly and specifically outline the scope, purpose, authorization, rules, and techniques to be utilized for the control of hazardous energy, and the means to enforce compliance including, but not limited to, the following:

(A) A specific statement of the intended use of the procedure;

(B) Specific procedural steps for shutting down, isolating, blocking and securing machines or equipment to control hazardous energy;

(C) Specific procedural steps for the placement, removal and transfer of lockout devices or tagout devices and the responsibility for them; and

(D) Specific requirements for testing a machine or equipment to determine and verify the effectiveness of lockout devices, tagout devices, and other energy control measures.

(5) *Protective materials and hardware.* (i) Locks, tags, chains, wedges, key blocks, adapter pins, self-locking fasteners, or other hardware shall be provided by the employer for isolating, securing or blocking of machines or equipment from energy sources.

(ii) Lockout devices and tagout devices shall be singularly identified; shall be the only devices(s) used for controlling energy; shall not be used for other purposes; and shall meet the following requirements:

(A) *Durable.* (*1*) Lockout and tagout devices shall be capable of withstanding the environment to which they are exposed for the maximum period of time that exposure is expected.

(*2*) Tagout devices shall be constructed and printed so that exposure to weather conditions or wet and damp locations will not cause the tag to deteriorate or the message on the tag to become illegible.

(*3*) Tags shall not deteriorate when used in corrosive environments such as areas where acid and alkali chemicals are handled and stored.

(B) *Standardized.* Lockout and tagout devices shall be standardized within the facility in at least one of the following criteria: Color; shape; or size; and additionally, in the case of tagout devices, print and format shall be standardized.

(C) *Substantial*—(*1*) *Lockout devices.* Lockout devices shall be substantial enough to prevent removal without the use of excessive force or unusual techniques, such as with the use of bolt cutters or other metal cutting tools.

(*2*) *Tagout devices.* Tagout devices, including and their means of attachment, shall be substantial enough to prevent inadvertent or accidental removal. Tagout device attachment means shall be of a non-reusable type, attachable by hand, self-locking, and non-releasable with a minimum unlocking strength of no less than 50 pounds and having the general design and basic characteristics of being at least equivalent to a one-piece, all-environment-tolerant nylon cable tie.

(D) *Identifiable.* Lockout devices and tagout devices shall indicate the identity of the employee applying the device(s).

(iii) Tagout devices shall warn against hazardous conditions if the machine or equipment is energized and shall include a legend such as the following: *Do Not Start, Do Not Open, Do Not Close, Do Not Energize, Do Not Operate.*

(6) *Periodic inspection.* (i) The employer shall conduct a periodic inspection of the energy control procedure at least annually to ensure that the procedure and the requirements of this standard are being followed.

(A) The periodic inspection shall be perfomed by an authorized employee other than the ones(s) utilizing the energy control procedure being inspected.

(B) The periodic inspection shall be designed to correct any deviations or inadequacies observed.

(C) Where lockout is used for energy control, the periodic inspection shall include a review, between the inspector and each authorized employee, of that employee's responsibilities under the energy control procedure being inspected.

(D) Where tagout is used for energy control, the periodic inspection shall include a review, between the inspector and each authorized and affected employee, of that employee's responsibilities under the energy control procedure being inspected, and the elements set forth in paragraph (c)(7)(ii) of this section.

(ii) The employer shall certify that the periodic inspections have been performed. The certification shall identify the machine or equipment on which the energy control procedure was being utilized, the date of the inspection, the employees included in the inspection, and the person performing the inspection.

(7) *Training and communication.* (i) The employer shall provide training to ensure that the purpose and function of the energy control program are understood by employees and that the knowledge and skills required for the safe application, usage, and removal of energy controls are required by employees. The training shall include the following:

(A) Each authorized employee shall receive training in the recognition of applicable hazardous energy sources, the type and magnitude of the energy available in the workplace, and the methods and means necessary for energy isolation and control.

(B) Each affected employee shall be instructed in the purpose and use of the energy control procedure.

(C) All other employees whose work operations are or may be in an area where energy control procedures may be utilized, shall be instructed about the procedure, and about the prohibition relating to attempts to restart or reenergize machines or equipment which are locked out or tagged out.

(ii) When tagout systems are used, employees shall also be trained in the following limitations of tags:

(A) Tags are essentially warning devices affixed to energy isolating devices, and do not provide the physical restraint on those devices that is provided by a lock.

(B) When a tag is attached to an energy isolating means, it is not to be removed without authorization of the authorized person responsible for it, and it is never to be bypassed, ignored, or otherwise defeated.

(C) Tags must be legible and understandable by all authorized employees, affected employees, and all other employees whose work operations are or may be in the area, in order to be effective.

(D) Tags and their means of attachment must be made of materials which will withstand the environmental conditions encountered in the workplace.

(E) Tags may evoke a false sense of security, and their meaning needs to be understood as part of the overall energy control program.

(F) Tags must be securely attached to energy isolating devices so that they cannot be inadvertently or accidentally detached during use.

(iii) Employee retraining.

(A) Retraining shall be provided for all authorized and affected employees whenever there is a change in their job assignments, a change in machines, equipment or processes that present a new hazard, or when there is a change in the energy control procedures.

(B) Additional retraining shall also be conducted whenever a periodic inspection under paragraph (c)(6) of this section reveals, or whenever the employer has reason to believe, that there are deviations from or inadequacies in the employee's knowledge or use of the energy control procedures.

(C) The retraining shall reestablish employee proficiency and introduce new or revised control methods and procedures, as necessary.

(iv) The employer shall certify that employee training has been accomplished and is being kept up to date. The certification shall contain each employee's name and dates of training.

(8) *Energy isolation.* Implementation of lockout or the tagout system shall be performed only by authorized employees.

(9) *Notification of employees.* Affected employees shall be notified by the employer or authorized employee of the application and removal of lockout devices or tagout devices. Notification shall be given before the controls are applied, and after they are removed from the machine or equipment.

(d) *Application of control.* The established procedure for the application of energy control (implementation of lockout or tagout system procedures) shall cover the following elements and actions and shall be done in the following sequence:

(1) *Preparation for shutdown.* Before an authorized or affected employee turns off a machine or equipment, the authorized employee shall have knowledge of the type and magnitude of the energy, the hazards of the energy to be controlled, and the method or means to control the energy.

(2) *Machine or equipment shutdown.* The machine or equipment shall be turned off or shut down using the procedures required by this standard. An orderly shutdown must be utilized to avoid any additional or increased hazard(s) to employees as a result of equipment deenergization.

(3) *Machine or equipment isolation.* All energy isolating devices that are needed to control the energy to the machine or equipment shall be physically located and operated in such a manner as to isolate the machine or equipment from the energy source(s).

(4) *Lockout or tagout device application.* (i) Lockout or tagout devices shall be affixed to each energy isolating device by authorized employees.

(ii) Lockout devices, where used, shall be affixed in a manner to that will hold the energy isolating devices in a "safe" or "off" position.

(iii) Tagout devices, where used, shall be affixed in such a manner as will clearly indicate that the operation or movement of energy isolating devices from the "safe" or "off" position is prohibited.

(A) Where tagout devices are used with energy isolating devices designed with the capability of being locked, the tag attachment shall be fastened at the same point at which the lock would have been attached.

(B) Where a tag cannot be affixed directly to the energy isolating device, the tag shall be located as close as safely possible to the device, in a position that will be immediately obvious to anyone attempting to operate the device.

(5) *Stored energy.* (i) Following the application of lockout or tagout devices to energy isolating devices, all potentially hazardous stored or residual energy shall be relieved, disconnected, restrained, and otherwise rendered safe.

(ii) If there is a possibility of reaccumulation of stored energy to a hazardous level, verification of isolation shall be continued until the servicing or maintenance is completed, or until the possibility of such accumulation no longer exists.

(6) *Verification of isolation.* Prior to starting work on machines or equipment that have been locked out or tagged out, the authorized employee shall verify that isolation and deenergization of the machine or equipment have been accomplished.

(e) *Release from lockout or tagout.* Before lockout or tagout devices are removed and energy is restored to the machine or equipment, procedures shall be followed and actions taken by the authorized employee(s) to ensure the following:

(1) *The machine or equipment.* The work area shall be inspected to ensure that nonessential items have been removed and to ensure that machine or equipment components are operationally intact.

(2) *Employees.* (i) The work area shall be checked to ensure that all employees have been safely positioned or removed.

(ii) Before lockout or tagout devices are removed and before machines or equipment are energized, affected employees shall be notified that the lockout or tagout devices have been removed.

(3) *Lockout or tagout devices removal.* Each lockout or tagout device shall be removed from each energy isolating device by the employee who applied the device. *Exception to paragraph (e)(3):* When the authorized employee who applied the lockout or tagout device is not available to remove it, that device may be removed under the direction of the employer, provided that specific procedures and training for such removal have been developed, documented and incorporated into the employer's energy control program. The employer shall demonstrate that the specific procedure provides equivalent safety to the removal of the device by the authorized employee who applied it. The specific procedure shall include at least the following elements:

(i) Verfication by the employer that the authorized employee who applied the device is not at the facility;

(ii) Making all reasonable efforts to contact the authorized employee to inform him/her that his/her lockout or tagout device has been removed; and

(iii) Ensuring that the authorized employee has this knowledge before he/she resumes work at that facility.

(f) *Additional requirements.* (1) *Testing or positioning of machines, equipment or components thereof.* In situations in which lockout or tagout devices must be temporarily removed from the energy isolating device and the machine or equipment energized to test or position the machine, equipment or component thereof, the following sequence of actions shall be followed:

(i) Clear the machine or equipment of tools and materials in accordance with paragraph (e)(1) of this section;

(ii) Remove employees from the machine or equipment area in accordance with paragraph (e)(2) of this section;

(iii) Remove the lockout or tagout devices as specified in paragraph (e)(3) of this section;

(iv) Energize and proceed with testing or positioning;

(v) Deenergize all systems and reapply energy control measures in accordance with paragraph (d) of this section to continue the servicing and/or maintenance.

(2) *Outside personnel (contractors, etc.).* (i) Whenever outside servicing personnel are to be engaged in activities covered by the scope and application of this standard, the on-site employer and the outside employer shall inform each other of their respective lockout or tagout procedures.

(ii) The on-side employer shall ensure that his/her personnel understand and comply with restrictions and prohibitions of the outside employer's energy control procedures.

(3) *Group lockout or tagout.* (i) When servicing and/or maintenance is performed by a crew, craft, department or other group, they shall utilize a procedure which affords the employees a level of protection equivalent to that provided by the implementation of a personal lockout or tagout device.

(ii) Group lockout or tagout devices shall be used in accordance with the procedures required by paragraph (c)(4) of this section including, but not necessarily limited to, the following specific requirements:

(A) Primary responsibility is vested in an authorized employee for a set number of employees working under the protection of a group lockout or tagout device (such as an operations lock);

(B) Provision for the authorized employee to ascertain the exposure status of individual group members with regard to the lockout or tagout of the machine or equipment and

(C) When more than one crew, craft, department, etc. is involved, assignment of overall job-associated lockout or tagout control responsibility to an authorized employee designated to coordinate affected work forces and ensure continuity of protection; and

(D) Each authorized employee shall affix a personal lockout or tagout device to the group lockout device, group lockbox, or comparable mechanism when he or she begins work, and shall remove those devices when he or she stops working on the machine or equipment being serviced or maintained.

(4) *Shift or personnel changes.* Specific procedures shall be utilized during shift or personnel changes to ensure the continuity of lockout or tagout protection, including provision for the orderly transfer of lockout or tagout devices between off-going and oncoming employees, to minimize exposure to hazards from the unexpected energization, start-up of the machine or equipment, or release of stored energy.

Note: The following Appendix to § 1910.147 services as a non-mandatory guideline to assist employers and employees in complying with the requirements of this section, as well as to provide other helpful information. Nothing in the Appendix adds to or detracts from any of the requirements of this section.

BILLING CODE 4510-26-M

APPENDIX A -- TYPICAL MINIMAL LOCKOUT OR TAGOUT SYSTEM PROCEDURES

General

Lockout is the preferred method of isolating machines or equipment from energy sources. To assist employers in developing a procedure which meets the requirements of the standard, however, the following simple procedure is provided for use in both lockout or tagout programs. This procedure may be used when there are limited number or types of machines or equipment or there is a single power source. For more complex systems, a more comprehensive procedure will need to be developed, documented, and utilized.

Lockout (or Tagout) Procedure for (Name of Company).

Purpose

This procedure establishes the minimum requirements for the lockout or tagout of energy isolating devices. It shall be used to ensure that the machine or equipment are isolated from all potentially hazardous energy, and locked out or tagged out before employees perform any servicing or maintenance activities where the unexpected energization, start-up or release of stored energy could cause injury (Type(s) and Magnitude(s) of Energy and Hazards).

Responsibility

Appropriate employees shall be instructed in the safety significance of the lockout (or tagout) procedure (Name(s)/Job Title(s) of employees authorized to lockout or tagout). Each new or transferred affected employee and other employees whose work operations are or may be in the area shall be instructed in the purpose and use of the lockout or tagout procedure (Name(s)/Job Title(s) of affected employees and how to notify).

Preparation for Lockout or Tagout

Make a survey to locate and identify all isolating devices to be certain which switch(s), valve(s) or other energy isolating devices apply to the equipment to be locked or tagged out. More than one energy source (electrical, mechanical, or others) may be involved. (Type(s) and Location(s) of energy isolating means).

Sequence of Lockout or Tagout System Procedure

(1) Notify all affected employees that a lockout or tagout system is going to be utilized and the reason therefor. The authorized employee shall know the type and magnitude of energy that the machine or equipment utilizes and shall understand the hazards thereof.

(2) If the machine or equipment is operating, shut it

down by the normal stopping procedure (depress stop button, open toggle switch, etc.)

(3) Operate the switch, valve, or other energy isolating device(s) so that the equipment is isolated from its energy source(s). Stored energy (such as that in springs, elevated machine members, rotating flywheels, hydraulic systems, and air, gas, steam, or water pressure, etc.) must be dissipated or restrained by methods such as repositioning, blocking, bleeding down, etc. (Type(s) of Stored Energy-methods to dissipate or restrain).

(4) Lockout and/or tagout the energy isolating devices with assigned individual lock(s) or tag(s) (Method(s) Selected; i.e., locks tags, additional safety measures, etc.)

(5) After ensuring that no personnel are exposed, and as a check on having disconnected the energy sources, operate the push button or other normal operating controls to make certain the equipment will not operate (Type(s) of Equipment checked to ensure disconnections).

CAUTION: Return operating control(s) to "neutral" or "off" position after the test.

(6) The equipment is now locked out or tagged out.

Restoring Machines or Equipment to Normal Production Operations

(1) After the servicing and/or maintenance is complete and equipment is ready for normal production operations, check the area around the machines or equipment to ensure that no one is exposed.

(2) After all tools have been removed from the machine or equipment, guards have been reinstalled and employees are in the clear, remove all lockout or tagout devices. Operate the energy isolating devices to restore energy to the machine or equipment.

Procedure Involving More Than One Person

In the preceding steps, if more than one individual is required to lockout or tagout equipment, each shall place his/her own personal lockout device or tagout device on the energy isolating device(s). When an energy isolating device cannot accept multiple locks or tags, a multiple lockout or tagout device (hasp) may be used. If lockout is used, a single lock may be used to lockout the machine or equipment with the key being placed in a lockout box or cabinet which allows the use of multiple locks to secure it. Each employee will then use his/her own lock to secure the box or cabinet. As each person no longer needs to maintain his or her lockout protection, that person will remove his/her lock from the box or cabinet

(Name(s)/Job Title(s) of employees authorized for group lockout or tagout).

Basic Rules for Using Lockout or Tagout System Procedure

All equipment shall be locked out or tagged out to protect against accidental or inadvertent operation when such operation could cause injury to personnel. Do not attempt to operate any switch, valve, or other energy isolating device where it is locked or a tagged out.

LOCKOUT (OR TAGOUT) PROCEDURE

Entry No	(Description)
1.	Name of Company
2.	Type(s) and Magnitude(s) of energy and hazards
3.	Names(s)/Job Title(s) of employees authorized to lockout or tagout
4.	Names(s)/Job Title(s) of affected employees and how to notify
5.	Type(s) and Location of energy isolating means
6.	Type(s) of Stored Energy-methods to dissipate or restrain
7.	Method(s) Selected i.e., locks, tags, additional safety measures, etc.
8.	Type(s) of Equipment checked to ensure disconnections
9.	Name(s)/Job Title(s) of employees authorized for group lockout or tagout

Department of Health and Human Services

National Institutes of Health

Recombinant DNA; Advisory Committee Meeting and Proposed Actions Under Guidelines for Research

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

Recombinant DNA Advisory Committee; Meeting

Pursuant to Public Law 92–463, notice is hereby given of a meeting of the Recombinant DNA Advisory Committee at the National Institutes of Health (NIH), Building 31C, Conference Room 6, 9000 Rockville Pike, Bethesda, Maryland 20892, on October 6, 1989, from approximately 9 a.m. to adjournment at approximately 5 p.m. This meeting will be open to the public to discuss:

Proposal that the Recombinant DNA Advisory Committee institute a study;
Proposed major actions;
Proposed revision of NIH Guidelines definition of recombinant DNA for the purposes of shipment;
Points to consider document on human gene transfer;
Amendment of NIH Guidelines; and
Other matters to be considered by the Committee.

Attendance by the public will be limited to space available. Members of the public wishing to speak at the meeting may be given such opportunity at the discretion of the Chair.

Dr. Nelson A. Wivel, Director, Office of Recombinant DNA Activities, National Institutes of Health, Building 31, Room 4B11, Bethesda, Maryland 20892, telephone (301) 496–9838, will provide materials to be discussed at the meeting, rosters of committee members, and substantive program information. A summary of the meeting will be available at a later date.

OMB's "Mandatory Information Requirements for Federal Assistance Program Announcements" (45 FR 39592) requires a statement concerning the official government programs contained in the *Catalog of Federal Domestic Assistance.* Normally NIH lists in its announcements the number and title of affected individual programs for the guidance of the public. Because the guidance in this notice covers not only virtually every NIH program but also essentially every Federal research program in which DNA recombinant molecule techniques could be used, it has been determined not to be cost effective or in the public interest to attempt to list these programs. Such a list would likely require several additional pages. In addition, NIH could not be certain that every Federal program would be included as many Federal agencies, as well as private organizations, both national and international, have elected to follow the NIH Guidelines. In lieu of the individual program listing, NIH invites readers to direct questions to the information address above about whether individual programs listed in the *Catalog of Federal Domestic Assistance* are affected.

Dated: August 28, 1989.

Betty J. Beveridge,

Committee Management Officer, NIH.

[FR Doc. 89–20661 Filed 8–31–89; 8:45 am]

BILLING CODE 4140-01-M

Recombinant DNA Research; Proposed Actions Under Guidelines

AGENCY: National Institutes of Health, PHS, DHHS.

ACTION: Notice of Proposed Actions Under the NIH Guidelines for Research Involving Recombinant DNA Molecules.

SUMMARY: This notice sets forth proposed actions to be taken under the National Institutes of Health (NIH) Guidelines for Research Involving Recombinant DNA Molecules. Interested parties are invited to submit comments concerning these proposals. These proposals will be considered by the Recombinant DNA Advisory Committee (RAC) at its meeting on October 6, 1989. After consideration of these proposals and comments by the RAC, the Acting Director of the National Institutes of Health will issue decisions in accordance with the NIH Guidelines.

DATES: Comments received by September 27, 1989, will be reproduced and distributed to the RAC for consideration at its October 6, 1989 meeting.

ADDRESS: Written comments and recommendations should be submitted to Dr. Nelson A. Wivel, Director, Office of Recombinant DNA Activities, Building 31, Room 4B11, National Institutes of Health, Bethesda, Maryland 20892 or send by telecopier to 301–496–9839. All comments received in timely response to this notice will be considered and will be available for public inspection in the above office on weekdays betwen the hours of 8:30 a.m. and 5:00 p.m.

FOR FURTHER INFORMATION CONTACT: Background documentation and additional information can be obtained from the Office of Recombinant DNA Activities, Building 31, Room 4B11, National Institutes of Health, Bethesda, Maryland 20892, (301) 496–9838.

SUPPLEMENTARY INFORMATION: The NIH will consider the following actions under the NIH Guidelines for Research Involving Recombinant DNA Molecules:

I. Amendment of Section I–B of the NIH Guidelines

At its meeting on January 30, 1989, the RAC discussed a proposal submitted by the National Wildlife Federation to amend section I–B, "Definition of Recombinant DNA Molecules," of the NIH Guidelines. There was general agreement that newer technologies are not covered under the current definition in the NIH Guidelines, which is based on early methods for cutting and joining pieces of DNA. The Committee requested that the Revision of the NIH Guidelines Subcommittee examine the current definition and revise it to encompass newer techniques, without greatly expanding the scope of the NIH Guidelines.

The Revision of the NIH Guidelines Subcommittee met on June 5, 1989, and considered this charge. The Subcommittee agreed that additional information regarding the potential effects of the new techniques was needed before the definition could be revised. Their conclusion was to recommend that:

> RAC institute a study on the extent to which new techniques for introducing foreign DNA into living cells without the use of recombinant DNA methodology pose potential biohazards.

II. Points To Consider Document on Human Gene Transfer

On September 29, 1986, the RAC adopted the "Points to Consider in the Design and Submission of Human Somatic-Cell Gene Therapy Protocols," which was prepared by the Human Gene Therapy Subcommittee."

At the January 30, 1989, meeting, the RAC endorsed a proposal to form a subcommittee to update and report to the Human Gene Therapy Subcommittee recommendations to amend the "Points to Consider." The Points to Consider Subcommittee met on March 31, 1989, and developed a draft revision of the original document.

On July 31, 1989, the Human Gene Therapy Subcommittee met to consider this document. The title and scope of the 1986 document were revised to reflect the Subcommittee's experiences reviewing a proposal for human gene transfer. The results of their deliberations are as follows:

NATIONAL INSTITUTES OF HEALTH

Points to Consider in the Design and Submission of Protocols for the Transfer of Recombinant DNA into Human Subjects—

Human Gene Therapy Subcommittee—

NIH Recombinant DNA Advisory Committee

Outline

Applicability
Introduction

I. Description of Proposal.

A. Objectives and rationale of the proposed research
1. Use of recombinant DNA for therapeutic purposes
2. Transfer of recombinant DNA for other purposes
B. Research design, anticipated risks and benefits
1. Structure and characteristics of the biological system
2. Preclinical studies, including risk assessment studies
3. Clinical procedures, including patient monitoring
4. Public health considerations
5. Qualifications of investigators, adequacy of laboratory and clinical facilities
C. Selection of patients
D. Informed consent
E. Privacy and confidentiality

II. Special Issues.

A. Provision of information to the public
B. Communication of research methods and results to investigators and clinicians

III. Requested Documentation.

A. Original protocol
B. IRB and IBC minutes and recommendations
C. One-page abstract of gene transfer protocol
D. One-page description of proposed experiment in non-technical language
E. Curricula vitae for key professional personnel
F. Indication of other federal agencies to which the protocol is being submitted
G. Other pertinent material

IV. Reporting Requirements.

National Institutes of Health

Points to Consider in the Design and Submission of Protocols for the Transfer of Recombinant DNA into Human Subjects

Applicability

These "Points to Consider" apply to research conducted at or sponsored by an institution that receives any support for recombiant DNA research from the National Institutes of Health (NIH). Other researchers (e.g., those employed by private companies, non-United States organizations, and non-profit organizations) are encouraged to use the "Points to Consider." Experiments in which recombiant DNA is introduced into cells of a human subject with the intent of stably modifying the subject's genome are covered by Section III–A–4 of the NIH Guidelines for Research Involving Recombinant DNA Molecules (49 FR 46266). Section III–A–4 applies both to recombinant DNA and to DNA or RNA derived from recombinant DNA.

Introduction

(1) This document is intended to provide guidance in preparing proposals for NIH consideration under Section III–A–4 of the NIH Guidelines for Research Involving Recombinant DNA Molecules. Section III–A–4 requires experiments involving the transfer of recombinant DNA into human subjects to be reviewed by the NIH Recombinant DNA Advisory Committee (RAC) and approved by the NIH. RAC consideration of each proposal will be on a case-by-case basis and will follow publication of a precis of the proposal in the **Federal Register**, an opportunity for public comment, and a review of the proposal by the Human Gene Therapy Subcommittee (the Subcommittee) of the RAC. RAC recommendations on each proposal will be forwarded to the NIH Director for a decision which will then be published in the **Federal Register**.

(2) In general, it is expected that the transfer of recombinant DNA into human subjects will not present a risk to public health or to the environment as the recombinant DNA is expected to be confined to the human subject. Nevertheless, Section I–B–4–b of the "Points to Consider" document specifically asks the researchers to address this point.

(3) This document will be considered for revision as experience in evaluating proposals accumulates and as new scientific developments occur. This review will be carried out periodically as needed.

(4) A proposal will be considered by the RAC only after the protocol has been approved by the local Institutional Biosafety Committee (IBC) and by the local Institutional Review Board (IRB) in accordance with Department of Health and Human Service (DHHS) Regulations for the Protection of Human Subjects (45 Code of Federal Regulations, Part 46). (If a proposal involves children, special attention should be paid to subpart D of these DHHS regulations.) The IRB and IBC may, at their discretion, condition their approval on further specific deliberation by the RAC and its Subcommittee. Consideration of proposals by the RAC may proceed simultaneously with review by any other involved federal agencies[1] provided that the RAC is notified of the simultaneous review. Meetings of the Committee and the Subcommittee will be open to the public except where trade secrets or proprietary information would be disclosed. The committee prefers that the first proposals submitted for RCA review contain no proprietary information or trade secrets, enabling all aspects of the review to be open to the public. The public review of these protocols will serve to inform the public not only on the technical aspects of the proposals but also on the meaning and significance of the research.

(5) The clinical application of recombinant DNA techniques raises two general kinds of questions: (i) the questions usually discussed by IRBs in their review of any proposed research involving human subjects; and (ii) broader issues. The first type of question is addressed principally in Part I of this document. Several broader issues are discussed later in this Introduction and in Part II below.

(6) Following the Introduction, this document is divided into four parts. Part I requests a description of the protocol with special attention to the short-term risks and benefits of the proposed research to the patient[2] and to other people, the selection of patients, informed consent, and privacy and confidentiality. In Part II, investigators are requested to address special issues pertaining to the free flow of information about the clinical trials. These issues lie outside the usual puview of IRRBs and reflect general public concerns about biomedical research. Part III summarizes other requested documentation that will assist the RAC and its Subcommittee in their review of the proposals. Part IV specifies reporting requirements.

(7) The RAC and its Subcommittee will not at present entertain proposals for germ line alterations but will consider for approval protocols involving somatic cell gene therapy. The purpose of somatic cell gene therapy is to treat an individual patient, e.g., by inserting a properly functioning gene into a patient's somatic cells. In germ line alterations, a specific attempt is made to introduce genetic changes into the germ (reproductive) cells of an individual, with the aim of changing the set of genes passed on to the individual's offspring.

(8) The acceptability of human somatic cell gene therapy has been addressed in several public documents as well as in numerous academic studies. The November 1982 report of the President's Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research, Splicing Life, resulted from a two-year process of public deliberations and hearings; upon release of that

report, a House subcommittee held three days of public hearings with witnesses from a wide range of fields from the biomedical and social sciences to theology, philosophy, and law. In December 1984, the Office of Technology Assessment released a background paper, Human Gene Therapy, which concluded:

"Civic, religious, scientific, and medical groups have all accepted, in principle, the appropriateness of gene therapy of somatic cells in humans for specific genetic diseases. Somatic cell gene therapy is seen as an extension of present methods of therapy that might be preferable to other technologies."

In light of this public support, the RAC is prepared to consider proposals for somatic cell gene therapy.

(9) In their evaluation of proposals involving the transfer of recombinant DNA into human subjects, the RAC and its Subcommittee will consider whether the design of such experiments offers adequate assurance that their consequences will not go beyond their purpose, which is the same as the traditional purpose of all clinical investigations, namely, to protect the health and well-being of the individual subjects being treated while at the same time gathering generalizable knowledge.

Two possible undesirable consequences of the transfer of recombinant DNA would be unintentional: (1) Vertical transmission of genetic changes from an individual to his or her offspring or (2) horizontal transmission of viral infection to other persons with whom the individual comes in contact. Accordingly, this document requests information that will enable the RAC and its Subcommittee to assess the possibility that the proposed experiments will inadvertently affect reproductive cells or lead to infection of other people (e.g., treatment personnel or relatives).

(10) In recognition of the social concern that surrounds the subject of gene transfer, the Subcommitte will cooperate with other groups in assessing the possible long-term consequences of the transfer of recombinant DNA into human subjects and related laboratory and minimal experiments in order to define appropriate human applications of this emerging technology.

(11) Responses to the questions raised in these "Points to Consider" should be provided in the form of either written answers or references to specific sections of the protocol or its appendices.

(12) Investigators should indicate points which are not applicable with a brief explanation. Investigators submitting proposals that employ essentially the same vector systems (or with minor variations), and/or that are based on the same preclinical testing as proposals previously reviewed by the Subcommittee and the Recombinant DNA Advisory Committee (RAC), may refer to proceeding documents without having to rewrite such material.

I. Description of Proposal—A. Objectives and rationale of the proposed research. State concisely the overall objectives and rationale of the proposed study. Please provide information on the specific points that relate to whichever type of research is being proposed:

1. Use of recombinant DNA for therapeutic purposes. For research in which recombinant DNA is transferred in order to treat a disease or disorder (e.g., genetic diseases, cancer, and metabolic diseases), the following questions should be addressed:

a. Why is the disease selected for treatment by means of gene therapy a good candidate for such treatment?

b. Describe the natural history and range of expression of the disease selected for treatment. What objective and/or quantitative measures of disease activity are available? In your view, are the usual effects of the disease predictable enough to allow for meaningful assessment of the results of gene therapy?

c. Is the protocol designed to prevent all manifestations of the disease, to halt the progression of the disease after symptoms have begun to appear, or to reverse manifestations of the disease in seriously ill victims?

d. What alternative therapies exist? In what groups of patients are these therapies effective? What are their relative advantages and disadvantages as compared with the proposed gene therapy?

2. Transfer of DNA for Other Purposes. a. Into what cells will the recombinant DNA be transferred? Why is the transfer of recombinant DNA necessary for the proposed research? What questions can be answered by using recombinant DNA?

b. What alternative methodologies exist? What are their relative advantages and disadvantages as compared to the use of recombinant DNA?

B. Research design, anticipated risks and benefits.—1. *Structure and characteristics of the biological system.* Provide a full description of the methods and reagents to be employed for gene delivery and the rationale for their use. The following are specific points to be addressed:

a. What is the structure of the cloned DNA that will be used?

(1) Describe the gene (genomic or cDNA), the bacterial plasmid or phage vector, and the delivery vector (if any). Provide complete nucleotide sequence analysis or a detailed restriction enzyme map of the total construct.

(2) What regulatory elements does the construct contain (e.g., promoters, enhancers, polyadenylation sites, replication origins, etc.)? From what source are these elements derived? Summarize what is currently known about the regulatory character of each element.

(3) Describe the steps used to derive the DNA construct.

b. What is the structure of the material that will be administered to the patient?

(1) Describe the preparation, structure, and composition of the materials that will be given to the patient or used to treat the patient's cells.

(a) If DNA, what is the purity (both in terms of being a single DNA species and in terms of other contaminants)? What tests have been used and what is the sensitivity of the tests?

(b) If a virus, how is it prepared from the DNA construct? In what cell is the virus grown (any special features)? What medium and serum are used? How is the virus purified? What is its structure and purity? What steps are being taken (and assays used with their sensitivity) to detect VL30 RNA, other nucleic acids, or proteins) or contaminating viruses (both replication-competent or replication-defective) or other organisms in the cells or serum used for preparation of the virus stock including any contaminants that may have biological effects?

(c) If co-cultivation is employed, what kinds of cells are being used for co-cultivation? What steps are being taken (and assays used with their sensitivity) to detect and eliminate any contaminating materials? Specifically, what tests are being done to assess the material to be returned to the patient for the presence of live or killed donor cells or other non-vector materials (for example, VL30 sequences) originating from those cells?

(d) If methods other than those covered by (a)-(c) are used to introduce new genetic information into target cells, what steps are being taken to detect and eliminate any contaminating materials? What are possible sources of contamination? What is the sensitivity of tests used to monitor contamination?

(2) Describe any other material to be used in preparation of the material to be administered to the patient. For example, if a viral vector is proposed, what is the nature of the helper virus or cell line? If carrier particles are to be used, what is the nature of these?

2. Preclinical studies, including risk-assessment studies. Describe the experimental basis (derived from tests in cultured cells and animals) for claims about the efficacy and safety of the proposed system for gene delivery and explain why the model(s) chosen is (are) the most appropriate.

a. Laboratory studies of the delivery system.

(1) What cells are the intended target cells of recombinant DNA? If target cells are to be treated ex vivo and returned to the patient, how will the cells be characterized before and after treatment? What is the theoretical and practical basis for assuming that only the target cells will incorporate the DNA?

(2) Is the delivery system efficient? What percentage of the target cells contain the added DNA?

(3) How is the structure of the added DNA sequences monitored and what is the sensitivity of the analysis? Is the added DNA extrachromosomal or integrated? Is the added DNA unrearranged?

(4) How many copies are present per cell? How stable is the added DNA both in terms of its continued presence and is structural stability?

b. Laboratory studies of gene transfer and expression.

(1) What animal and cultured cell models were used in laboratory studies to assess the *in vivo* and *in vitro* efficacy of the gene transfer system? In what ways are these models similar to and different from the proposed human treatment?

(2) What is the minimal level of gene transfer and/or expression that is estimated to be necessary for the gene transfer protocol to be successful in humans? How was this level determined?

(3) Explain in detail all results from animal and cultured cell model experiments which assess the effectiveness of the delivery system (part 2.a. above) in achieving the minimally required level of gene transfer and expression (2.b.(2) above).

(4) To what extent is expression only from the desired gene (and not from the surrounding DNA)? To what extent does the insertion modify the expression of other genes?

(5) In what percentage of cells does expression from the added DNA occur? Is the product biologically active? What percentage of normal activity results from the inserted gene?

(6) Is the gene expressed in cells other than the target cells? If so, to what extent?

c. Laboratory studies pertaining to the safety of the delivery/expression system.

(1) If a retroviral system is used:

(a) What cell types have been infected with the retroviral vector preparation? Which cells, if any, produce infectious particles?

(b) How stable are the retroviral vector and the resulting provirus against loss, rearrangement, recombination, or mutation? What information is available on how much rearrangement or recombination with endogenous or other viral sequences is likely to occur in the patient's cells? What steps have been taken in designing the vector to minimize instability or variation? What laboratory studies have been performed to check for stability, and what is the sensitivity of the analyses?

(c) What laboratory evidence is available concerning potential harmful effects of the transfer, e.g., development of neoplasia, harmful mutations, regeneration of infectious particles, or immune responses? What steps have been taken in designing the vector to minimize pathogenicity? What laboratory studies have been performed to check for pathogenicity, and what is the sensitivity of the analyses?

(d) Is there evidence from animal studies that vector DNA has entered untreated cells, particularly germ line cells? What is the sensitivity of the analyses?

(e) Has a protocol similar to the one proposed for a clinical trial been carried out in non-human primates and/or other animals? What were the results? Specifically, is there any evidence that the retroviral vector has recombined with any endogenous or other viral sequences in the animals?

(2) If a non-retroviral delivery system is used: What animal studies have been done to determine if there are pathological or other undesirable consequences of the protocol (including insertion of DNA into cells other than those treated, particularly germ line cells)? How long have the animals been studied after treatment? What tests have been used and what is their sensitivity?

3. Clinical procedures, including patient monitoring. Describe the treatment that will be administered to patients and the diagnostic methods that will be used to monitor the success or failure of the treatment. If previous clinical studies using similar methods have been performed by yourself or others, indicate their relevance to the proposed study.

a. Will cells (e.g., bone marrow cells) be removed from patients and treated ex vivo? If so, what kinds of cells will be removed from the patients, how many, how often, and at what intervals?

b. Will patients be treated to eliminate or reduce the number of cells containing malfunctioning genes (e.g., through radiation or chemotherapy)?

c. What treated cells (or vector/DNA combination) will be given to patients? How will the treated cells be administered? What volume of cells will be used? Will there be single or multiple treatments? If so, over what period of time?

d. How will it be determined that new gene sequences have been inserted into the patient's cells and if these sequences are being expressed? Are these cells limited to the intended target cell populations? How sensitive are these analyses?

e. What studies will be done to assess the presence and effects of the contaminants?

f. What are the clinical endpoints of the study? Are there objective and quantitative measurements to assess the natural history of the disease? Will such measurements be used in following patients? How will patients be monitored to assess specific effects of the treatment on the disease? What is the sensitivity of the analyses? How frequently will follow-up studies be done? How long will patient follow-up continue?

g. What are the major beneficial and adverse effects of treatment that you anticipate? What measures will be taken in an attempt to control or reverse these adverse effects if they occur? Compare the probability and magnitude of potential adverse effects on patients with the probability and magnitude of deleterious consequences from the disease if recombinant DNA transfer is not used.

h. If a treated patient dies, what special post mortem studies will be performed?

4. Public health considerations. Describe any potential benefits and hazards of the proposed therapy to persons other than the patients being treated. Specifically:

a. On what basis are potential public health benefits or hazards postulated?

b. Is there a significant possibility that the added DNA will spread from the patient to other persons or to the environment?

c. What precautions will be taken against such spread (e.g., to patients sharing a room, health-care workers, or family members)?

d. What measures will be undertaken to mitigate the risks, if any, to public health?

e. In light of possible risks to offspring, including vertical transmission, will birth control measures be recommended to the patient? Are such concerns applicable to health care personnel?

5. Qualifications of investigators, adequacy of laboratory and clinical facilities. Indicate the relevant training and experience of the personnel who will be involved in the preclinical studies and clinical administration of recombinant DNA. In addition, please describe the laboratory and clinical facilities where the proposed study will be performed.

a. What professional personnel (medical and nonmedical) will be involved in the proposed study and what is their relevant expertise? Please provide curricula vitae of key professional personnel (see Section III–E).

b. At what hospital or clinic will the treatment be given? Which facilities of the hospital or clinic will be especially important for the proposed study? Will patients occupy regular hospital beds or clinical research center beds? Where will patients reside during the follow-up period? What special arrangements will be made for the comfort and consideration of the patients? Will the research institution designate an ombudsman, patient care representative, or other individual to help protect the rights and welfare of the patient?

C. *Selection of patients.* Estimate the number of patients to be involved in the proposed study. Describe recruitment procedures and patient eligibility requirements, paying particular attention to whether these procedures and requirements are fair and equitable.

1. How many patients do you plan to involve in the proposed study?

2. How many eligible patients do you anticipate being able to identify each year?

3. What recruitment procedures do you plan to use?

4. What selection criteria do you plan to employ? What are the exclusion and inclusion criteria for the study?

5. How will patients be selected if it is not possible to include all who desire to participate?

D. *Informed consent.* Indicate how patients will be informed about the proposed study and how their consent will be solicited. The consent procedure should adhere to the requirements of DHHS regulations for the protection of human subjects (45 Code of Federal Regulations, Part 46). If the study involves pediatric or mentally handicapped patients, describe procedures for seeking the permission of parents or guardians and, where applicable, the assent of each patient. Areas of special concern highlighted below include potential adverse effects, financial costs, privacy, long-term follow-up, and post mortem examination.

1. How will the major points covered in Sections I–A through I–C of this document be disclosed to potential participants in this study and/or parents or guardians in language that is understandable to them?

2. How will the innovative character and the theoretically possible adverse effects of the experiment be discussed with patients and/or parents or guardians? How will the potential adverse effects be compared with the consequences of the disease?

3. What explanation of the financial costs of the experiment, follow-up care, and any available alternatives will be provided to patients and/or parents or guardians?

4. How will patients and/or their parents or guardians be informed that the innovative character of the experiment may lead to great interest by the media in the research and in treated patients?

5. How will patients and/or their parents or guardians be informed:

a. About the irreversible consequences of some of the procedures performed?

b. About any adverse medical consequences that may occur if a subject withdraws from the study once it has begun?

c. About expectations of willingness to cooperate in long-term follow-up?

d. About expectations that permission to perform an autopsy will be granted in the event of a patient's death following transfer as a precondition for a patient's participation in the study? This stipulation is included because an accurate determination of the precise cause of a patient's death would be of vital importance to all future patients.

E. *Privacy and confidentiality.* Indicate what measures will be taken to protect the privacy of patients and their families as well as to maintain the confidentiality of research data.

1. What provisions will be made to honor the wishes of individual patients (and the parents or guardians of pediatric or mentally handicapped patients) as to whether, when, or how the identity of patients is publicly disclosed?

2. What provision will be made to maintain the confidentiality of research data, at least in cases where data could be linked to individual patients?

II. Special Issues

Although the following issues are beyond the normal purview of local IRBs, the RAC and its Subcommittee request that investigators respond to questions A and B below.

A. What steps will be taken, consistent with point I-E above, to ensure that accurate and appropriate information is made available to the public with respect to such public concerns as may arise from the proposed study?

B. Do you or your funding sources intend to protect under patent or trade secret laws either the products or the procedures developed in the proposed study? If so, what steps will be taken to permit as full communication as possible among investigators and clinicians concerning research methods and results?

III. Requested Documentation

In addition to responses to the questions raised in these "Points to Consider," please submit the following materials:

A. Your protocol as approved by your local IRB and IBC.

B. Results of local IRB and IBC deliberations and recommendations that pertain to your protocol.

C. A one-page scientific abstract of the protocol.

D. A one-page description of the proposed experiment in nontechnical language.

E. Curricula vitae for key professional personnel.

F. An indication of other federal agencies to which the protocol is being submitted for review.

G. Any other material which you believe will aid in the review.

IV. Reporting Requirements

A. Serious adverse effects of treatment should be reported immediately to both the local IRB and the NIH Office for Protection from Research Risks, and a written report should be filed with both groups. A copy of the report should also be forwarded to the NIH Office of Recombinant DNA Activities (ORDA).

B. Reports regarding the general progress of patients should be filed with both your local IRB and ORDA within 6 months of the commencement of the experiment and at six-month intervals thereafter. These twice-yearly reports should continue for a sufficient period of time to allow observation of all major effects. In the event of a patient's death, a summary of the special post mortem studies and statement of the cause of death should be submitted to the IRB and ORDA, if available.

Footnotes:

1. The Food and Drug Administration (FDA) has jurisdiction over drug products intended for use in clinical trials of human gene transfer. For general information on FDA's policies and regulatory requirements, please see the **Federal Register**, Volume 51, pages 23309–23313, 1986.

2. The term "patient" and its variants are used in the text as a shorthand designation for "patient-subject."

III. Proposal to Amend Appendix H of the NIH Guidelines

The **Federal Register** of June 24, 1988 (53 FR 23775), contained a proposal by the Postal Service to ban the shipment of all etiologic agents, or materials believed to contain etiologic agents, as defined by the Department of Transportation and the Department of Health and Human Services regulations. Under Appendix H of the current NIH Guidelines for Research Involving Recombinant DNA Molecules of May 7, 1986 (52 FR 16976), this ban could apply to all shipments of recombinant molecules contained within an organism or virus, regardless of whether they are potentially hazardous to human health. Such a ban could affect the terms and conditions under which commercial shippers would transport recombinant DNA products. The RAC recognized the potential significance of this issue and referred it to the Definitions Subcommittee of the RAC, which met on December 5, 1988, and developed the following proposal:

A. Proposed replacement of Appendix H

"Preamble:

"Recombinant DNA molecules contained in an organism or in a viral genome shall be shipped under the appropriate requirements of the U.S. Public Health Service (42 CFR, part 72), U.S. Department of Agriculture (9 CFR subchapters D&E; 7 CFR, part 340) and/or the U.S. Department of Transportation (49 CFR, part 173). For purposes of these Guidelines the following recombinant DNA molecules contained in an organism or in a viral genome shall be shipped as etiologic agents: (1) those listed as Class 2, 3, or 4 agents in Appendix B; and/or (2) those contained in reference G–III–2 [1]; and/or (3) those regulated as animal or plant pathogens or pests under titles 7 and 9 CFR; or (4) host organisms containing recombinant DNA derived from those organisms or viral genomes.

"Appendix H–I:

"An illustration of one method of packaging and labeling of recombinant DNA-containing microorganisms and viral genomes defined as etiologic agents in the Preamble is shown in Figures 1, 2, and 3. Additional information on packaging and shipping is given in the "Laboratory Safety Monograph—A Supplement to the NIH Guidelines for Recombinant DNA Research," available from the Office of Recombinant DNA Activities and in the publication Biosafety in Microbiological and Biomedical Laboratories.[1]

"Appendix H–II—Footnote and References of Appendix H:

1. Biosafety in Microbial and Biomedical Laboratories, 2nd Edition, (May 1988), U.S. Department of Health and Human Services, Centers for Disease Control, Atlanta, Georgia 30333, and National Institutes of Health, Bethesda, Maryland 20892."

B. *Proposed Replacement of the Illustration in Appendix H.*

The heading changes and the replacement paragraph were written by NIH staff on December 12, 1988, to reflect the intent of the Definitions Subcommittee of the RAC.

The replacement paragraph would read:

"Figures 1, 2, and 3 depict one method for the packaging and labeling of those recombinant DNA-containing organisms and viral genomes defined as etiologic agents in the Preamble of Appendix H. The key features are identified in Figure 1. It is the responsibility of the shipper to comply with the applicable requirements of 42 CFR part 72 and 49 CFR part 173 when shipping biological materials or etiologic agents. It is recommended that all organisms containing recombinant molecules, which are exempt and/or Class 1 agents, should be shipped in secure, leak-proof containers."

After considering this proposal at the January 30, 1989, meeting, the RAC members agreed that it solved 90 percent of the difficulties posed by the original version, but that additional work was needed.

The Definitions Subcommittee met on July 12, 1989, and adopted the following motion:

"To recommend to the Recombinant DNA Advisory Committee consideration and adoption of the following amendment to Appendix H of the NIH Guidelines for Research Involving Recombinant DNA Molecules:

"Appendix H is to be replaced as follows:

"Appendix H—Shipment.

"Recombinant DNA molecules contained in an organism or in a viral genome shall be shipped under the applicable regulations of the U.S. Postal Service; the U.S. Public Health Service (42 CFR Part 72); the U.S. Department of Agriculture (9 CFR subchapters D and E; 7 CFR Part 340); and/or the U.S. Department of Transportation (49 CFR Parts 171–179).

"For purposes of the NIH Guidelines:

"Host organisms or viruses will be defined as etiologic agents regardless of whether or not they contain recombinant DNA if they are regulated as human pathogens under U.S. Public Health Service (42 CFR Part 72) or as animal pathogens or plant pests under the Animal and Plant Health Inspection Service (APHIS), U.S. Department of Agriculture (Titles 9 and 7 CFR, respectively).

"Additionally, host organisms and viruses will be defined as etiologic agents if they contain recombinant DNA when:

"A. the recombinant DNA includes the complete genome of a host organism or virus regulated as a human or animal pathogen or a plant pest; or

"B. the recombinant DNA codes for a toxin or other factor directly involved in eliciting human, animal or plant disease or inhibiting plant growth and is carried on an expression vector or within the host chromosome and/or when the host organism contains a conjugation proficient plasmid or a generalized transducing phage; or

"C. the recombinant DNA comes from a host organism or virus regulated as a human or animal pathogen or as a plant pest and has not been adequately characterized to demonstrate that it does not code for a factor involved in eliciting human, animal or plant disease.

"Appendix H–1—Footnotes and References of Appendix H.

"For further information on shipping etiologic agents, please contact: (1) Centers for Disease Control, ATTN: Biohazards Control Office, 1600 Clifton Road, Atlanta, Georgia 30333, (404) 639–3883, FTS 236–3883; (2) Department of Transportation, ATTN: Office of Hazardous Materials Transportation, 400 7th Street SW., Washington, DC 20590, (202) 366–4545; or (3) Department of Agriculture, ATTN: Animal & Plant Health Inspection Service, 6505 Belcrest Road, Hyattsville, Maryland 20782, (301) 436–7885 for Animal Pathogens, (301) 436–7612 for Plant Pests."

IV. Proposed Amendment of the NIH Guidelines Regarding Klebsiella oxytoca

In a letter dated August 3, 1989, Dr. Rogers Yocum, Director, Biochemical Products and Processes, Biotechnica International, Cambridge, Massachusetts, requests that certain experiments involving all strains derived from *Klebsiella oxytoca* strain M5a1 be given exempt or BL1 status under the NIH Guidelines.

In his August 3, 1989 letter, Dr. Yocum states:

"BioTechnica International, Inc. would like to request that certain experiments involving all strains derived from *Klebsiella oxytoca* strain M5a1 be given exempt or BL1 status in the NIH Guidelines for Recombinant DNA Research. We believe that *K. oxytoca* M5a1 has had a long history of safe use in many laboratories and that BL1 containment should be more than adequate. Self cloning experiments and experiments involving DNA clones isolated from non-pathogenic organisms or clones that are known not to encode production of toxic materials and transformed into M5a1 should be as harmless as experiments that utilize the non-recombinant strain. Below we will document what we know of the history and the nature of *K. oxytoca* M5a1, which we shall call 'M5a1' from here on.

"The earliest reference we know for M5a1 is a 1946 paper on butanediol fermentation (Freeman (1946), The fermentation of sucrose by *Aerobacter aerogenes*, Chemical Abstracts in Biochemistry 41: 389–398). M5a1 was isolated in the 1930's by Dr. Elizabeth McCoy at the University of Wisconsin (Winston Brill, personal communication). The strain was originally classified as *Aerobacter aerogenes*, (Wilson (1955) Nitrogen fixation in *Aerobacter aerogenes*, in Biochemistry of

Nitrogen, A.I. Vitanen Homage Volume, Ann. Acad. Scientarium. Fennicae Ser. AII *60*, 139–150; Mahl et al. (1965) Nitrogen fixation by members of the tribe *Klebsiella*, J. Bact. *89*: 1481–1487). The strain was distributed to various workers interested in free living nitrogen fixing bacteria in the 1940's by Dr. M.J. Johnson of the University of Wisconsin and in the 1960's by Dr. Perry Wilson also of the University of Wisconsin. In 1965 the strain was reclassified as *Klebsiella pneumoniae* by the CDC (CDC #2551–63). M5a1 was once again reclassified in 1977 to *K. oxytoca* (CDC Publication 78–8356). The primary taxonomic difference between *K. oxytoca* and *K. pneumonia* is that *K. oxytoca* produces indole while *K. pneumoniae* does not. We have tested M5a1 for indole production and have confirmed that M5a1 does produce indole from tryptophan. In general, *K. oxytoca* is found in the intestines of humans and animals, and in 'botanical and aquatic environments' (Bergey's Manual of Systematic Bacteriology (1986), Sneath, ed., Williams and Wilkins, Baltimore). Thus *K. oxytoca* appears to be ubiquitous. Wild-type M5a1 is resistant to low levels of ampicillin (up to 100 μg/ml) but it is sensitive to higher levels of ampicillin and usual experimental levels of kanamycin, tetracycline, cephalosporins and chloramphenicol.

"Interest in M5a1 expanded in 1971 (Streicher et al. (1971), Transduction of the nitrogen fixation genes in *Klebsiella pneumoniae* DNAs *68*: 1174–1177). M5a1 was one of two strains of *K. pneumoniae* that was shown to be sensitive to bacteriophage P1 out of a total of 27 strains tested. The significance of P1 sensitivity was that P1 is routinely used for generalized transduction in *E. coli*, an extremely useful genetic technique. The ability to transduce mutations among strains of *K. pneumoniae* would greatly accelerate study of the genes involved in nitrogen fixation. Thus M5a1 became the strain of choice for studying the genetics of nitrogen fixation in at least four different labs: Ray Valentine, University of California, Berkeley; Winston Brill, University of Wisconsin; Ray Dixon, Sussex; Ethan Signer and Fred Ausubel, MIT. The MIT lab renamed M5a1 as 'KP1,' which reflects its seminal position in their strain collection. The MIT group then discovered that M5a1 would support growth of the lambdoid coliphage 424 and that M5a1 had a DNA restriction system that prevented efficient transfer of DNA from *E. coli* to M5a1. They subsequently isolated a restrictionless mutant of M5a1, called KP5022, which became the parent of many other derivatives (Streicher et al. (1974) Regulation of Nitrogen Fixation in *Klebsiella pneumoniae*, J. Bact. *120*: 815–821).

"M5a1 was then shown to be 'non-capsulated,' a trait that is common with *E. coli* K–12, and which may account for the reduced pathogenicity of *E. coli* K–12 (Shanmugam et al. (1974) Bioch. Biophys. Acta *338*: 545–553). In fact it was probably the non-capsulated nature of M5a1 that made it more susceptible than other *Klebsiella* strains to phages of P1 and 424.

"Winston Brill's group showed that bacteriophage Mu could infect M5a1. The group then used variants of Mu to mutagenize and construct fusions of *nif* genes to *E. coli* lacZ. They renamed M5a1 as 'UN,' and generated many hundreds of derivatives, such as UN1290, which contains the recA56 allele of *E. coli* transduced into M5a1 (MacNeil et al. (1981), Regulation of Nitrogen Fixation in *Klebsiella pneumoniae*, J. Bact. *145*: 348–357; MacNeil et al (1978) Fine structure mapping and complementation analysis of *nif* genes in *Klebsiella pneumoniae*, J. Bact. *136*: 253–288).

"During the 1970's there was much work at the University of Sussex and elsewhere on the enzymology of nitrogen fixation. Large amounts of nitrogenase enzyme were required, and since the genetic work was being done in M5a1 and its derivatives, M5a1 became the organism of choice for producing nitrogenase. M5a1 was grown routinely in 1,000 liter fermentors, and kilogram quantities of cell pastes were routinely worked up, using no special precautions (Eady et al. (1972) Biochem. J. *128*: 655–675). In fact, they reported injecting live M5a1 into rabbits for the purpose of raising antibodies against intact cells. No pathogenic effects were observed (see Appendix I, page 4). Appendix I also documents the successful M5a1 declassification petitions of the Postgate lab at Sussex to the Genetic Manipulation Advisory Committee, U.K. They obtained permission to perform various M5a1 recombinant experiments under conditions of good microbiological practice. Thus M5a1 has been used in several labs, both genetic and biochemical since 1946. No harmful effects of M5a1 have been reported from any of the labs.

"Finally, starting in the 1970's, many recombinant DNA experiments have been done with M5a1. In particular, all of the genes involved in nitrogen fixation and many of the genes involved in regulation of nitrogen metabolism of M5a1 have been cloned into *E. coli* K–12 (for examples, see Dixon et al. (1976) Construction of a P plasmid carrying nitrogen fixation genes from *Klebsiella pneumoniae*, Nature *260*: 268–271; Cannon et al. (1988) The nucleotide sequence of the *nif* gene of *Klebsiella pneumoniae*, Nuc. Acids. Res. *16*: 11379).

"The current NIH guidelines for recombinant DNA work (Federal Register Volume *51*, no. 88, May 7, 1986) are contradictory with respect to *Klebsiella*. On one hand, the genus *Klebsiella* is considered to be a natural DNA exchanger with *E. coli*, and so any cloning between *E. coli* and *Klebsiella* in *either direction* is exempt (p. 16967). On the other hand, *Klebsiella*—all species and serotypes—is listed as a Class 2 pathogen, and as such, cloning into *Klebsiella* requires BL2 containment (paragraph III–B–1–a, p. 16960) and cloning recombinant DNA from *Klebsiella* into non-pathogenic prokaryotes (i.e. *E. coli* K–12) also requires BL2 containment (paragraph III–B–2–a, p. 16960). We request that the status of *Klebsiella* be clarified, particularly in the case of *K. oxytoca* strain M5a1. Specifically, we propose that the following classes of experiments and fermentations of the resulting organisms be exempted from the guidelines:

"(1) All self cloning experiments involving DNA from M5a1 and any of its derivatives.

"(2) All experiments involving clones of M5a1 DNA into *E. coli* K–12.

"In addition, we propose that the following classes of experiments be given BL1 status:

"(1) All experiments involving clones of *E. coli* K–12 DNA into M5a1.

"(2) All experiments involving well defined clones from nonpathogenic organisms or clones known not to contain DNA that encodes production of material toxic to vertebrates into M5al.

"We feel that the history of safe use of M5al and the ubiquitous distribution of *K. oxytoca* justify these containment conditions."

Additional documentation supporting this request is provided in an appendix that will be distributed at the meeting. This material also is available upon request from ORDA.

V. Other Matters to be Considered

Time permitting, the following agenda items will be presented and discussed:

1. The National Research Council has conducted a project entitled, *Scientific Evaluation of the Introduction of Genetically Modified Microorganisms and Plants into the Environment.* Publication of this report is scheduled for September 1989. The results of this project will be of use to the RAC in its consideration of revisions to Section I–A, "Definition of Recombinant DNA" of the NIH Guidelines.

2. The Department of Commerce has issued an interim rule regarding the export of microorganisms, including specific provisions requiring an export license for "all genetically engineered or manipulated agents." A revised rule is expected to be published shortly. A Department of Commerce representative will present a status report on the rule.

OMB's "Mandatory Information Requirements for Federal Assistance Program Announcements" (45 FR 39592) requires a statement concerning the official government programs contained in the Catalog of Federal Domestic Assistance. Normally NIH lists in its announcements the number and title of affected individual programs for the guidance of the public. Because the guidance in this notice covers not only virtually every NIH program but also essentially every Federal research program in which DNA recombinant molecule techniques could be used, it has been determined to be not cost effective or in the public interest to attempt to list these programs. Such a list would likely require several additional pages. In addition, NIH could not be certain that every Federal program would be included as many Federal agencies, as well as private organizations, both national and international, have elected to follow the NIH Guidelines. In lieu of the individual program listing, NIH invites readers to direct questions to the information address above about whether individual

programs listed in the Catalog of Federal Domestic Assistance are affected.

Jay Moskowitz,

Associate Director, Office of Science Policy and Legislation, National Institutes of Health.

Part VI

Department of Transportation

Urban Mass Transportation Administration

49 CFR Part 633
Project Management Oversight; Final Rule

DEPARTMENT OF TRANSPORTATION

Urban Mass Transportation Administration

49 CFR Part 633

[Docket No. 87-B]

RIN 2132-AA31

Project Management Oversight

AGENCY: Urban Mass Transportation Administration (UMTA), DOT.

ACTION: Final rule.

SUMMARY: This final rule implements section 324 of the Surface Transportation and Uniform Relocation Assistance Act of 1987. This section permits UMTA to use up to ½ of 1 percent of the funds made available in each fiscal year under UMTA's capital grants programs for project management oversight of major capital projects. Section 324 also requires a recipient implementing a major capital project with Federal financial assistance from UMTA to prepare and implement a project management plan. Finally, section 324 requires UMTA to implement its provisions by regulation. This rule will improve the quality of major capital projects receiving funding from UMTA.

EFFECTIVE DATE: This rule will be effective on October 2, 1989.

FOR FURTHER INFORMATION CONTACT: For general program questions: Frank McCarron, Office of Grants Management, Room 9315, UMTA, 400 7th St., SW., Washington, DC 20590, (202) 366–2440. For legal matters: Susan Schruth, Office of Chief Counsel, Room 9316, same address, (202) 366–4011.

SUPPLEMENTARY INFORMATION:

I. Background

UMTA provides Federal financial assistance to support urban areas in the planning, development, and improvement of comprehensive mass transportation systems. This assistance is provided by means of a variety of programs within the statutory authority granted by the Urban Mass Transportation Act of 1964, as amended (the UMT Act). UMTA assistance comes in many forms, including providing a matching share for capital construction of mass transportation projects, research and development dollars, assistance for operations, and several small, specialized programs.

A. *UMTA Project Management Initiatives.* Beginning in 1983, UMTA reviewed the way in which it provided oversight of one of its principal functional areas—construction of major capital projects by recipients of its funds. After examining a number of other Federal and related agency oversight programs, UMTA concluded that it was important to increase its independent oversight of significant UMTA-funded projects. UMTA developed a national project management oversight program for major capital projects using independent contractors. At that time, the definition of major capital project focused on new rail start projects. Under the program, UMTA assigned independent contractors, paid by and reporting directly to UMTA, to perform project management oversight functions on certain major capital projects. This arrangement allowed UMTA to more carefully monitor certain major capital projects without increasing its staff.

The program was useful immediately to UMTA and its recipients. The contractor's report became a key resource document UMTA used in evaluating a recipient's technical capacity and capability to execute a major capital project. The contractor's report also enabled the recipient to objectively assess various aspects of its capabilities.

There were, however, significant funding problems with this UMTA initiative. UMTA was not authorized to use funds from any of its major capital programs to provide for such a program, and instead had to rely on funding from its smaller research and study programs. This problem was resolved when Congress, in both the FY 1986 and FY 1987 DOT appropriation acts, authorized UMTA to use up to ½ of 1 percent of the funding available under its major capital programs in each of those fiscal years to contract directly with independent contractors for project management oversight.

By competitive procurement in 1986, UMTA retained a number of highly qualified national firms as contractors. Currently these contractors are working actively on over 25 separate assignments covering over 40 projects. In making assignments, considerable effort is taken to make certain that there is no real or apparent conflict of interest between an UMTA contractor and the project(s) assigned to the contractor. Once assigned to a project, the contractor monitors the recipient's overall implementation of the project and reports on it directly to UMTA. Such a report emphasizes project cost, schedule, and quality, and enables UMTA to assess effectively a recipient's performance on a particular project. When necessary, the report also makes recommendations for modifying practices to improve project performance.

B. *Statutory Program.* Because of the success and usefulness of UMTA's project oversight initiative, Congress included a project management oversight program in UMTA's reauthorization legislation (the Surface Transportation and Uniform Relocation Assistance Act of 1987, (STURAA) Pub. L. 100–17, effective April 2, 1987). Section 324 of STURAA added a new section 23 to the UMT Act.

Section 23 goes beyond UMTA's initiative of the mid-1980's by specifying three elements of the project management oversight program. First, UMTA may use up to ½ of 1 percent of the funds available under sections 3, 9, and 18 of the Urban Mass Transportation Act of 1964, as amended, 23 U.S.C. 103(e)(4) (interstate transfer—transit projects), and section 14(b) of the National Capital Transportation Amendments of 1979 (the Washington, DC Metrorail system) for project management oversight. Second, section 23 of the UMT Act requires a recipient constructing a major capital project to prepare a project management plan and, upon UMTA approval, to implement such plan. And third, section 23 requires UMTA to issue regulations to implement its provisions. This rulemaking is intended to fulfill this third provision of section 23.

II. The NPRM

UMTA published its notice of proposed rulemaking (NPRM) on August 11, 1987 (52 FR 29702). In response to the NPRM, UMTA received seventeen (17) comments, broken-down by the following categories:

11 UMTA urban recipients and lcoal governments
1 Contractor providing PMO services
4 State governments
1 Public Trade Association

All commenters were in general support of the PMO regulation, although most made recommendations on specific aspects of the rule. These specific recommendations are noted below and discussed in detail in the next section of the preamble ("Section-by-Section Analysis").

UMTA specifically sought comment on the definition of major capital project, and seven commenters requested clarification of this definition. Two commenters addressed the time period for the submission of the project management plan. Five commenters proposed that the requirement for monthly submissions of cost and data be changed to a quarterly submission. Two commenters suggested that a project management plan be deemed approved if the Administrator's review is not completed within sixty days.

Commenters also sought deletion of updated ridership estimates, the addition of exemptions from the PMO program, exclusion of the section 18 program from the PMO regulation, and clarification of the process for obtaining a waiver from certain items otherwise required to be included in the project management plan.

The final rule published today is substantively similar to the proposed rule. The following section-by-section analysis discusses these significant comments in more detail, as well as the agency's response to these comments.

III. Section-by-Section Analysis and Response To Public Comments

This portion of the preamble discusses each section of the final rule. It includes a review of any significant comments on a particular issue, as well as UMTA's response to such comments and its reasons for making the decisions incorporated in the final rule. The structure of the final rule is somewhat different from the proposed rule: to make the rule clearer, the agency has broken down a few large sections into several smaller sections. This, combined with descriptive section headings, should make the rule easier to use.

Subpart A—General Provisions

Section 633.1 Purpose

This section explains that the purpose of the rule is to implement section 23 of the UMT Act, as added by section 324 of the Surface Transportation and Uniform Relocation Assistance Act of 1987. The agency received no comments on this section. The agency has added to this section a brief description of the two different thrusts of the part—project management oversight and project management plans.

Section 633.3 Scope

This section provides that the part applies to any recipient of UMTA financial assistance undertaking a major capital project. The agency received no comments on this section.

Section 633.5 Definitions

This section contains ten definitions specifically applicable to this part. Several definitions drew comment.

Major Capital Project. "Major Capital Project" is an important element of this regulation, since it triggers both project management oversight on the part of UMTA and requires a recipient to comply with the project management plan provisions of the regulation. The NPRM defined a major capital project as having three separate categories: (1) Any new start rail project or extension; (2) any rail modernization project costing more than $100 million; or (3) a project determined to be a major capital project for purposes of this program by the Administrator. We noted in the preamble to the NPRM that one area in which the Administrator generally would be expected to exercise discretion to designate a project as major is any project costing more than $100 million.

Seven commenters recommended that further consideration be given to our definition. Commenters noted that the $100 million threshold language was not included in the proposed rule itself. Similarly, commenters criticized the lack of concise criteria or process for determining what constitutes a major capital project in the third instance—that is, the Administrator's discretionary designation of a project as "major"—and suggested that UMTA establish evaluation criteria to define more narrowly and objectively the Administrator's discretion. Commenters are concerned that the lack of objective criteria in this regard could create uncertainty and confusion as project planning, programming and implementation proceed without a recipient knowing whether the project might at some point be deemed "major" by UMTA.

UMTA recognizes this concern; in response, we have included in the final rule more specific guidance regarding the determination of what may constitute a major capital project. The final rule breaks down the concept of major capital project into three principal types. First is any new start project or extension. Second is any rehabilitation or modernization project, if costs exceed $100 million. These projects automatically are subject to the provisions of Part 633. That is, automatically these recipients will have to develop a project management plan, and they will be subject to some kind of project management oversight. The agency anticipates that these first two categories will constitute the great majority of the projects covered by part 633.

The third principal category identified in the major capital project definition includes those projects "deemed major" by the Administrator. It is this third category which has caused confusion among commenters and which we have clarified in the final rule. This category provides the Administrator with the necessary flexibility to apply the benefits of the project management oversight program to projects on an as-needed basis. This is not to say that a decision about any project would be arbitrary or capricious. Indeed, a necessary element of each decision by the Administrator is a determination that the project management oversight program will benefit specifically the agency or the recipient, or both.

Although the agency cannot specifically identify all types of cases in which the Administrator may make this type of determination, we have tried to list both here and in the definition section of the regulation the most likely types of projects under this third category:

(1) A project that generally is expected to have a total project cost in excess of $100 million;

(2) A project that is not exclusively for the routine acquisition, maintenance, or rehabilitation of vehicles or other rolling stock;

(3) A project that involves new technology;

(4) A project that is of a unique nature for the recipient; or

(5) A project involving a recipient whose past experience indicates to the agency the appropriateness of the extension of this program.

The final rule also makes it clear that any project deemed major by the Administrator will be subject to both parts of the project management oversight program—developing a project management plan and subject to project management oversight.

One final note concerning projects subject to a discretionary determination of "major" by the Administrator. Section 23 of the UMT Act also provides that the definition of major capital project "shall exclude projects for the acquisition of vehicles or other rolling stock, or for the performance of vehicle maintenance or rehabilitation." UMTA believes that the legislative intent in this regard was to exclude *routine* acquisition, rehabilitation or maintenance of vehicles or rolling stock from coverage of the rule—that is, to exclude those activities undertaken by a recipient in its normal course of business to maintain current service with existing or on-the-shelf technology. On the other hand, in UMTA's view the acquisition rehabilitation, or maintenance of vehicles by a recipient using technology or methods not utilized curently in the day-to-day operation of transit systems in this country, or in the day-to-day operations of a particular recipient, should not be excluded categorically from the project management oversight program, nor was it meant to be. Accordingly, projects involving non-routine acquisition, rehabilitation or maintenance are included in the third category of major capital projects—those within the descretion of the Administrator to designate as major if the Administrator determines it is to the benefit of UMTA, the recipient, or both.

Project Management. UMTA has added a definition of "project management plan" to the final rule. Under the statute, such a plan must be prepared by each recipient undertaking a major capital project, and must be approved by UMTA. The plan is the key reference document for a project participant to implement, and for an observer to monitor, a project. It is a dynamic document which may change often and be revised as the project passes through different phases. In addition to being a recipient's key management tool, the project management plan is a primary resource document used by UMTA in determining a recipient's technical capacity and capability to carry out a project.

Grantee. Finally, to be consistent with other UMTA regulations, we have replaced the definition of the term "grantee" with a definition of "recipient" in the final rule. A recipient is the entity that enters into a grant agreement with UMTA. Thus, we have deleted from the final rule the term "grantee" and replaced it in each case with "recipient." If the recipient does not actually carry out a proposed project, but rather passes funds through to some other entity, and the project is major for purposes of this regulation, it remains the responsibility of the recipient to make certain that this regulation is complied with either directly by the recipient or by the entity carrying out the project.

Subpart B—Project management oversight services

Section 633.7 of the NPRM contained all of the provisions relating to PMO services. There were no comments on these provisions. In the final rule, this material is broken down into five sections. New § 633.11 indicates which statutory funding programs are covered by this part. Section 633.13 discusses the timing of the initiation of this program—noting that while UMTA normally will contract for PMO services during the grant application process, it is possible that the agency will determine a project is a major capital project at some later date. The agency then would contract for PMO services at this later time.

Section 633.15 sets out the information access provisions—that the recipient must make records and sites available to UMTA or the PMO contractor.

Section 633.17 states that project management oversight services may be provided by any person or entity. UMTA anticipates that PMO will continue to be carried out by private companies, but it it possible that other entities, such as states, may be used. No recipient can provide PMO services in connection with its own project. Furthermore, the entity carrying out PMO may not have a conflict of interest with regard to the project and would be required to have an objective and unbiased outlook vis a vis the particular project. There also may be instances in which UMTA staff would itself provide all required PMO services. This section also makes it clear that UMTA uses government-wide procurement regulations found at 48 CFR CH I when contracting for PMO services.

Section 633.19 describes the Federal share for a PMO contract—100 percent—and indicates that UMTA is authorized to expend for project management oversight an amount not to exceed one-half of one percent of the funds made available each year under sections 3, 9, and 18 of the UMT Act, as well as under 23 U.S.C. 103(e)(4) and section 14(b) of the National Capital Transportation Amendments of 1979. Under sections 9 and 18, UMTA, as necessary, takes these funds "off the top" of the appropriation before the funds are allocated or apportioned under their particular requirements.

The practice under Section 3 and under the Interstate Transfer provision is somewhat different given the practice by Congress of earmarking those programs. Section 3 by law is divided into separate categories. UMTA takes the PMO ½ of 1 percent from each separate category, rather than directly "off the top". For the New Starts category, Congress fully earmarks projects to be funded. Thus, each earmark may be reduced by ½ of 1 percent to fund PMO activities. Under the Interstate Transfer Program, Congress specifically sets aside funds for PMO activities as part of their earmarks. Thus, the earmarks do not have to be reduced. Of course, if Congress were to change any of its practices discussed above the agency would have to reexamine how it takes down the PMO funds.

Subpart C—Project Management Plans

Old § 633.11, project management plans, has been broken down into two sections to help readability. New § 633.21 provides that, as a condition of Federal financial assistance, a recipient undertaking a major capital project submit a project management plan to UMTA. Two commenters addressed the timing of the submission of the project management plan. One suggested that it should not be required until after a grant is awarded; another proposed that it should be submitted after grant approval.

UMTA recognizes that each project is different, and that establishing absolute procedures without exceptions can be problemmatic in the grants area. The PMP is a dynamic document reflecting the four stages of a project (preliminary engineering, final design, construction, start up). The initial PMP must address subsequent elements of the project—if only in a general way. For example, it may not be possible for a recipient to submit detailed information on its change order procedure at the preliminary engineering stage, even though this is a required element of the plan. Initially, the recipient must address this requirement in general terms. Section 633.27 makes it clear that the recipient must submit periodic updates to the plan, as needed and appropriate.

However, UMTA also believes that the PMP is a key document in determining a recipient's technical capability and capacity to implement a project. Even as early as the grant application stage, a potential recipient needs to have considered how the project will be administered as much as it has defined what actual work and construction needs to be done. In this connection, section 3(a)(2)(A)(i) of the UMT Act states that "[n]o grant * * * shall be provided under this section unless the Secretary determines that the applicant has or will have the technical capacity to carry out the proposed project."

To assist UMTA in making the statutory determination noted above, the final rule provides generally that a project management plan must be submitted during the grant review process and is part of UMTA's grant application review. UMTA recognizes that the due date for such a plan may vary depending on the nature of the major capital project involved, the circumstances surrounding its development, as well as the fact that UMTA may not have even determined that there is a major capital project involved. UMTA will strive to make its determination as early as possible.

In most cases, then, UMTA will notify the recipient of the plan's due date for the final plan during the grant review process. In those cases where the Administrator determines after grant review that a project is major, UMTA will notify the applicant as soon as possible after the determination. The final rule adds a provision (§ 633.21(c)) that the grantee will have at least 90 days from UMTA notification of the

project management plan requirement to the due date of the plan. (Of course, an applicant for a new start or a major rail modernization project knows that it has to prepare a project management plan and may wish to submit it with its grant application to UMTA.)

New § 633.23 provides that UMTA has 60 days from the receipt of a final plan to notify the recipient that the plan is approved or disapproved; that it will require some changes before approval; or indicate that UMTA has not yet completed review of the plan, and state when that review will be completed. Two commenters suggested that the plan be deemed approved if UMTA's review is not complete within the 60 days. UMTA believes that such a provision would not be prudent management on its part. We recognize, however, that action must be taken within 60 days, either in the form of approval or disapproval of the plan, or a statement that UMTA needs more time to review the plan, and the regulation so provides.

Section 663.25, contents of a project management plan, discusses the contents of a project management plan and reflects, as did the provision in the NPRM, the specific requirements of the statute. One commenter suggested that the submission of updated ridership estimates be deleted. This is a statutory requirement, and as such cannot be deleted from the rule.

As noted in the NPRM, section 324 of the Act enumerated specific elements of the plan. The Act also stated, however, that the plan "* * * shall, as required in each case by the Secretary, provide for * * *" the specifically listed elements. The agency believes that the language "as required in each case by the Secretary" provides some discretion to the Administrator in determining the proper contents of each plan. Section 633.29 permits the Administrator, upon application of a grantee or on the Administrator's own initiative, to waive certain requirements upon a clear showing that any of the elements are unnecessary.

In this connection, one commenter suggested a more specific process for obtaining a waiver. In response, the agency does not believe that it would be possible to describe every specific basis for granting a waiver. Waivers will be considered on a case-by-case basis as requested in writing by a recipient. UMTA will grant waivers based on the merits of a specific request, consistent with the underlying purpose of section 23 of the UMT Act.

One commenter suggested that a recipient with an approved project management plan be exempt from submitting a new plan for a new project. The agency believes that it would not be prudent to approve a one-time submission of the project management plan. UMTA needs to verify periodically that the recipient is following the approved plan for a particular project and to monitor its implementation and changes. However, a recipient that manages multiple major capital projects using a plan that has been approved previously by UMTA, may resubmit the document, state that it seeks to execute the proposed project using the same plan, and request a waiver. UMTA will consider granting a waiver from the requirement of a new plan and let the existing plan be used for the new project. If this approach is approved by UMTA and any changes to the old plan are to be made, the recipient need only document those changes.

Section 633.27 discusses implementation of a project management plan after approval by the Administrator, as well as the requirement that a recipient submit periodic updates to the project management plan. Further, the recipient is required to submit monthly data on the project's cost and schedule data. Several commenters suggested that this requirement was too burdensome and duplicative. Section 23 of the UMTA Act specifically includes this requirement and consequently, the agency must include it in the final rule. In any event, the monthly submission of cost and schedule information is data that the recipient should have available and the provision requires the minimum—that the recipient send UMTA a copy of its basic project monitoring data on a monthly basis. Further, this request is not in conflict with the more detailed data required on a quarterly basis.

IV. Regulatory Impacts

A. Significant Rulemaking Analysis

This action has been reviewed under Executive Order 12291, and it has been determined that it is not a major rule. If promulgated, this rule would not result in an annual effect on the economy of $100 million or more, nor would it create a major increase in costs or prices for consumers, individual industries, or geographic regions, nor have significant adverse effects on competition, employment, investment, innovation or the ability of United States-based enterprises to compete in domestic or export markets. Moreover, this regulation is not significant under the Department's Regulatory Policies and Procedures. UMTA finds that economic impact of this regulation is minimal and a full regulatory evaluation is not necessary.

B. Regulatory Flexibility Act

In accordance with 5 U.S.C. 605(b), as added by the Regulatory Flexibility Act, Public Law 95–354, UMTA certifies that this proposed rule, if promulgated, will not have a significant economic impact on a substantial number of small entities within the meaning of the Act.

C. Federalism Analysis

This proposed rule has been reviewed under Executive Order 12612 on "Federalism", and UMTA has determined that it does not have implications for principles of Federalism that warrant the preparation of a Federalism Assessment. If promulgated, this rule will not limit the policymaking and administrative discretion of the States, nor will it affect the States' abilities to discharge traditional State governmental functions or otherwise affect any aspects of State sovereignty.

D. Paperwork Reduction Act

The collection of information requirements in this rule is subject to the Paperwork Reduction Act, Public Law 96–511, 44 U.S.C. Chapter 35. Section 324(e) of the Act specifically requires a grantee constructing a major capital project to prepare a plan and submit it to UMTA for approval. These requirements have been submitted to the Office of Management and Budget (OMB) and have received approval under OMB control number 2132–0502.

List of Subjects in 49 CFR Part 633

Government contracts. Grant programs—Transportation, Mass Transportation.

Accordingly, for the reasons described in the preamble, 49 CFR chapter VI is amended by adding a new part 633, as set forth below:

PART 633—PROJECT MANAGEMENT OVERSIGHT

Sec.

Subpart A—General Provisions

633.1 Purpose.
633.3 Scope.
633.5 Definitions.

Subpart B—Project Management Oversight Services

633.11 Covered projects.
633.13 Initiation of PMO services.
633.15 Access to information.
633.17 PMO contractor eligibility.
633.19 Financing the PMO program.

Subpart C—Project Management Plans

633.21 Basic requirement.
633.23 UMTA review of PMP.

633.25 Contents of a project management plan.
633.27 Implementation of a project management plan.
633.29 PMP waivers.

Authority: 49 U.S.C. 1601 et. seq., 1619.

Subpart A—General Provisions

§ 633.1 Purpose.

This part implements section 324 of the Surface Transportation and Uniform Relocation Assistance Act of 1987 (Pub. L. 100–17), which added section 23 to the UMT Act. The part provides for a two-part program for major capital projects receiving assistance from the agency. First, Subpart B discusses project management oversight, designed primarily to aid UMTA in its role of ensuring successful implementation of federally-funded projects. Second, Subpart C discusses the project management plan (PMP) required of all major capital projects. The PMP is designed to enhance the recipient's planning and implementation efforts and to assist UMTA's grant application analysis efforts.

§ 633.3 Scope.

This rule applies to a recipient of Federal financial assistance undertaking a major capital project using funds made available under:

(a) Sections 3, 9, or 18 of the Urban Mass Transportation Act of 1964, as amended;

(b) 23 U.S.C. 103(e)(4); or

(c) Section 14(b) of the National Capital Transportation Amendments of 1979 (93 Stat. 1320, Pub. L. 96–184).

§ 633.5 Definitions.

As used in this part:

Administrator means the Administrator of the Urban Mass Transportation Administration or the Administrator's designee.

Days means calendar days.

Fixed guideway means any public transportation facility which utilizes and occupies a separate right-of-way or rails. This includes, but is not limited to, rapid rail, light rail, commuter rail, automated guideway transit, people movers, and exclusive facilities for buses and other high occupancy vehicles.

Full funding agreement means a written agreement between UMTA and a recipient that establishes a financial ceiling with respect to the Government's participation in a project; sets forth the scope of a project; and sets forth the mutual understanding, terms, and conditions relating to the construction and management of a project.

Major capital project means a project that:

(1) Involves the construction of a new fixed guideway or extension of an existing fixed guideway;

(2) Involves the rehabilitation or modernization of an existing fixed guideway with a total project cost in excess of $100 million; or

(3) The Administrator determines is a major capital project because the project management oversight program will benefit specifically the agency or the recipient. Typically, this means a project that:

(i) Generally is expected to have a total project cost in excess of $100 million or more to construct;

(ii) Is not exclusively for the routine acquisition, maintenance, or rehabilitation of vehicles or other rolling stock;

(iii) Involves new technology;

(iv) Is of a unique nature for the recipient; or

(v) Involves a recipient whose past experience indicates to the agency the appropriateness of the extension of this program.

Project management oversight means the monitoring of a major capital project's progress to determine whether a project is on time, within budget, in conformance with design criteria, constructed to approved plans and specifications and is efficiently and effectively implemented.

Project management plan means a written document prepared by a recipient that explicitly defines all tasks necessary to implement a major capital project.

Recipient means a direct recipient of Federal financial assistance from UMTA.

UMT Act means the Urban Mass Transportation Act of 1964, as amended.

UMTA means the Urban Mass Transportation Administration.

Subpart B—Project Management Oversight Services

§ 633.11 Covered projects.

The Administrator may contract for project management oversight services when the following two conditions apply:

(a) The recipient is using funds made available under section 3, 9, or 18 of the Urban Mass Transportation Act of 1964, as amended; 23 U.S.C. 103(e)(4); or section 14(b) of the National Capital Transportation Amendments of 1979; and

(b) The project is a "major capital project".

§ 633.13 Initiation of PMO services.

PMO services will be initiated as soon as it is practicable, once the agency determines this part applies. In most cases, this means that PMO will begin during the preliminary engineering phase of the project. However, consistent with other provisions in this part, the Administrator may determine that a project is a "major capital project" at any point during its implementation. Should this occur, PMO will begin as soon as practicable after this agency determination.

§ 633.15 Access to information.

A recipient of UMTA funds for a major capital project shall provide the Administrator and the PMO contractor chosen under this part access to its records and construction sites, as reasonably may be required.

§ 633.17 PMO contractor eligibility.

(a) Any person or entity may provide project management oversight services in connection with a major capital project, with the following exceptions:

(1) An entity may not provide PMO services for its own project; and

(2) An entity may not provide PMO services for a project if there exists a conflict of interest.

(b) In choosing private sector persons or entities to provide project management oversight services, UMTA uses the procurement requirements in the government-wide procurement regulations, found at 48 CFR CH I.

§ 633.19 Financing the PMO program.

(a) UMTA is authorized to expend up to ½ of 1 percent of the funds made available each fiscal year under sections 3, 9, or 18 of the UMT Act, 23 U.S.C. 103(e)(4), or section 14(b) of the National Capital Transportation Amendments of 1979 (93 Stat. 1320) to contract with any person or entity to provide a project management oversight service in connection with a major capital project as defined in this part.

(b) A contract entered into between UMTA and a person or entity for project management oversight services under this part will provide for the payment by UMTA of 100 percent of the cost of carrying out the contract.

Subpart C—Project Management Plans

§ 633.21 Basic requirement.

(a) If a project meets the definition of major capital project, the recipient shall submit a project management plan prepared in accordance with § 633.25 of this part, as a condition of Federal financial assistance. As a general rule, the PMP must be submitted during the grant review process and is part of UMTA's grant application review. This section applies if:

(1) The project fails under one of the automatic major capital investment project categories (§ 633.5(1) or (2) of this part); or

(2) UMTA makes a determination that a project is a major capital project, consistent with the definition of major capital project in § 633.5. This determination normally will be made during the grant review process. However, UMTA may make such determination after grant approval.

(b)(1) UMTA will notify the recipient when it must submit the PMP. Normally, UMTA will notify the recipient sometime during the grant review process. If UMTA determines the project is major under its discretionary authority after the grant has been approved, UMTA will inform the recipient of its determination as soon as possible.

(2) Once UMTA has notified the recipient that it must submit a plan, the recipient will have a minimum of 90 days to submit the plan.

§ 633.23 UMTA review of PMP.

Within 60 days of receipt of a project management plan, the Administrator will notify the recipient that:

(a) The plan is approved;

(b) The plan is disapproved, including the reasons for the disapproval;

(c) The plan will require modification, as specified, before approval; or

(d) The Administrator has not yet completed review of the plan, and state when it will be reviewed.

§ 633.25 Contents of a project management plan.

At a minimum, a recipient's project management plan shall include—

(a) A description of adequate recipient staff organization, complete with well-defined reporting relationships, statements of functional responsibilities, job descriptions, and job qualifications;

(b) A budget covering the project management organization, appropriate consultants, property acquisition, utility relocation, systems demonstration staff, audits, and such miscellaneous costs as the recipient may be prepared to justify;

(c) A construction schedule;

(d) A document control procedure and recordkeeping system;

(e) A change order procedure which includes a documented, systematic approach to the handling of construction change orders;

(f) A description of organizational structures, management skills, and staffing levels required throughout the construction phase;

(g) Quality control and quality assurance programs which define functions, procedures, and responsibilities for construction and for system installation and integration of system components;

(h) Material testing policies and procedures;

(i) Plan for internal reporting requirements including cost and schedule control procedures; and

(j) Criteria and procedures to be used for testing the operational system or its major components;

§ 633.27 Implementation of a project management plan.

(a) Upon approval of a project management plan by the Administrator the recipient shall begin implementing the plan.

(b) If a recipient must modify an approved project management plan, the recipient shall submit the proposed changes to the Administrator along with an explanation of the need for the changes.

(c) A recipient shall submit periodic updates of the project management plan to the Administrator. Such updates shall include, but not be limited to:

(1) Project budget;

(2) Project schedule;

(3) Financing, both capital and operating;

(4) Ridership estimates, including operating plan; and

(5) Where applicable, the status of local efforts to enhance ridership when estimates are contingent, in part, upon the success of such efforts.

(d) A recipient shall submit current data on a major capital project's budget and schedule to the Administrator on a monthly basis.

§ 633.29 PMP waivers.

A waiver will be considered upon initiation by the grantee or by the agency itself. The Administrator may, on a case-by-case basis, waive:

(a) Any of the PMP elements in § 633.25 of this part if the Administrator determines the element is not necessary for a particular plan; or

(b) The requirement of having a new project management plan submitted for a major capital project if a recipient seeks to manage the major capital project under a previously-approved project management plan.

Issued on: May 28, 1989.

Roland J. Mross,

Deputy Administrator.

Part VII

Department of Education

Student Literacy Corps Program; Invitation for Applications for New Awards for Fiscal Year 1990; Notice

DEPARTMENT OF EDUCATION

[CFDA No. 84.219]

Student Literacy Corps Program; Invitation for Applications for New Awards for Fiscal Year 1990

Note to Applicants: This notice is a complete application package. Together with the statute authorizing the program and applicable regulations governing the program, including the Education Department General Administrative Regulations (EDGAR), the notice contains information, application forms, and instructions needed to apply for a grant under this competition.

Purpose of Program: To promote student literacy corps projects operated by institutions of higher education (IHEs) where volunteer undergraduates will serve as unpaid literacy tutors in public community agencies.

Deadline for Transmittal of Applications: January 2, 1990.

Deadline for Intergovernmental Review: March 2, 1990.

Available Funds: $5,108,000.

Estimated Range of Awards: Up to $50,000.

Estimated Average Size of Awards: $45,000.

Estimated Number of Awards: 90–110.

Note: The Department is not bound by any estimate in this notice.

Project Period: 24 months.

Applicable Regulations: The Education Department General Administrative Regulations (EDGAR) in 34 CFR part 74 (Administration of Grants to Institutions of Higher Education, Hospitals and Nonprofit Organizations), part 75 (Direct Grant Programs), part 77 (Definitions that Apply to Department Regulations), part 79 (Intergovernmental Review of Department of Education Programs and Activities), and part 85 (Governmentwide Debarment and Suspension (Nonprocurement) and Governmentwide Requirements for Drug-Free Workplace (Grants)).

Description of Program: The Secretary of Education will make two-year non-renewable grants to eligible institutions of higher education to support literacy training at public community agency facilities. No more than $25,000 can be expended by any IHE during the first year. To be eligible to receive a grant, an IHE must demonstrate that it has previously engaged in community service activities. Specifically, it must indicate that it has either used a portion of its allotment under part C of title IV of the Higher Education Act of 1965, as amended (HEA), for work study and community service learning under section 443(b)(2)(A), or conducted a cooperative education program.

Upon request of the IHE, the Secretary may grant a waiver of the prior community service requirement described above if the IHE provides assurances that: (a)(1) it has conducted some other significant program involving community outreach and service; or (2) if it has not conducted such a program, it can demonstrate that it currently has the ability to engage in outreach efforts necessary to carry out Student Literacy Corps requirements; and (b) in the event that it receives an allotment under part C of title IV of the HEA, that a portion of this allotment will be used for community service learning programs.

Each IHE applicant must provide assurances in its application for Student Literacy Corps Program funds that—

(a) Its grant will be used to cover an IHE's costs of participation in the Student Literacy Corps Program for which assistance is sought, including evaluation and stipends for student coordinators, and funds made available will not be used for the payment of stipends or salaries to tutors, in accordance with the USES OF FUNDS provision in the authorizing legislation (20 U.S.C. 1018b);

(b) It will provide literacy tutoring services in structured classroom settings supervised by qualified personnel in one or more public community agencies in the community in which it is located that serve educationally or economically disadvantaged individuals (the term "public community agency" means an established community agency with an established program of instruction such as elementary and secondary schools, Head Start Centers, prisons, agencies serving youth, and agencies serving the handicapped, including disabled veterans);

(c) It will offer one or more courses for academic credit (in such academic areas as the social sciences, economics or education) designed to combine formal study with undergraduates' experience as literacy tutors;

(d) As a condition of receiving credit for the courses of instruction referred to in paragraph (c) above, undergraduates will perform not less than six hours of voluntary, uncompensated service each week of the academic term in a public community agency as tutors in its educational or literacy programs;

(e) The tutoring service referred to in paragraph (d) above will be supplementary both to the IHE's regular academic program and the existing instructional services offered by the community service learning programs; and

(f) It will make arrangements for adequate training of volunteers, depending upon available resources, which may include the training of student coordinators to assist in the process of preparing and placing undergraduates as tutors in community service learning programs.

Selection Criteria:

(a)(1) The Secretary uses the following selection criteria to evaluate applications for new grants under this competition.

(2) The maximum score for all of these criteria is 100 points.

(3) The maximum score for each criterion is indicated in parentheses.

(b) *The criteria.*—(1) *Meeting the purposes of the authorizing statute.* (30 points) The Secretary reviews each application to determine how well the project will meet the purpose of Title I, part D of the Higher Education Act of 1965, as amended, including consideration of—

(i) The objectives of the project; and

(ii) How the objectives of the project further the purposes of Title I, part D of the Higher Education Act of 1965, as amended.

(2) *Extent of need for the project.* (20 points) The Secretary reviews each application to determine the extent to which the project meets specific needs recognized in Title I, part D of the higher Education Act of 1965, as amended, including consideration of—

(i) The needs addressed by the project;

(ii) How the applicant identified those needs;

(iii) How those needs will be met by the project; and

(iv) The benefits to be gained by meeting those needs.

(3) *Plan of operation.* (30 points) The Secretary reviews each application to determine the quality of the plan of operation for the project, including—

(i) The quality of the design of the project;

(ii) The extent to which the plan of management is effective and ensures proper and efficient administration of the project;

(iii) How well the objectives of the project relate to the purpose of the program;

(iv) The quality of the applicant's plan to use its resources and personnel to achieve each objective;

(v) How the applicant will ensure that project participants who are otherwise eligible to participate are selected without regard to race, color, national origin, gender, age, or handicapping condition; and

(vi) For grants under a program that requires the applicant to provide an opportunity for participation of students enrolled in private schools, the quality of the applicant's plan to provide that opportunity.

(4) *Quality of key personnel.* (7 points)

(i) The Secretary reviews each application to determine the quality of key personnel the applicant plans to use on the project, including—

(A) The qualifications of the project director (if one is to be used);

(B) The qualifications of each of the other key personnel to be used in the project;

(C) The time that each person referred to in paragraph (b)(4)(i) (A) and (B) will commit to the project; and

(D) How the applicant, as part of its nondiscriminatory employment practices, will ensure that its personnel are selected for employment without regard to race, color, national origin, gender, age, or handicapping condition.

(ii) To determine personnel qualifications under paragraphs (b)(4)(i) (A) and (B), the Secretary considers—

(A) Experience and training in fields related to the objectives of the project; and

(B) Any other qualifications that pertain to the quality of the project.

(5) *Budget and cost effectiveness.* (5 points) The Secretary reviews each application to determine the extent to which—

(i) The budget is adequate to support the project; and

(ii) Costs are reasonable in relation to the objectives of the project.

(6) *Evaluation plan.* (5 points) The Secretary reviews each application to determine the quality of the evaluation plan for the project, including the extent to which the applicant's methods of evaluation—

(i) Are appropriate to the project; and

(ii) To the extent possible, are objective and produce data that are quantifiable.

(Cross-reference: See 34 CFR 75.590 Evaluation by the grantee.)

(7) *Adequacy of resources.* (3 points) The Secretary reviews each application to determine the adequacy of the resources that the applicant plans to devote to the project, including facilities, equipment, and supplies.

Intergovernmental Review of Federal Programs

This program is subject to the requirements of Executive Order 12372 (Intergovernmental Review of Federal Programs) and the regulations in 34 CFR Part 79.

The objective of the Executive order is to foster an intergovernmental partnership and to strengthen federalism by relying on State and local processes for State and local government coordination and review of proposed Federal financial assistance.

Applicants must contact the appropriate State Single Point of Contact to find out about, and to comply with, the State's process under Executive Order 12372. Applicants proposing to perform activities in more than one State should immediately contact the Single Point of Contact for each of those States and follow the procedure established in each State under the Executive order. If you want to know the name and address of any State Single Point of Contact, see the list published in the **Federal Register** on November 18, 1987, pages 44338–44340.

In States that have not established a process or chosen a program for review, State, areawide, regional, and local entities may submit comments directly to the Department.

Any State Process Recommendation and other comments submitted by a State Single Point of Contact and any comments from State, areawide, regional, and local entities must be mailed or hand-delivered by the date indicated in this notice to the following address: The Secretary, E.O. 12372—CFDA # 84.219, U.S. Department of Education, Room 4161, 400 Maryland Avenue, SW., Washington, DC 20202–0125.

Proof of mailing will be determined on the same basis as applications (see 34 CFR 75.102). Recommendations or comments may be hand-delivered until 4:30 p.m. (Washington, DC time) on the date indicated in this notice.

Please note that this address is not the same address as the one to which the applicant submits its completed application. Do not send application to the above address.

Instructions for Transmittal of Applications

(a) If an applicant wants to apply for a grant, the applicant shall—

(1) Mail the original and two copies of the application on or before the deadline date to: U.S. Department of Education, Application Control Center, Attention: (CFDA # 84.219), Washington, DC 20202–4725.

or

(2) Hand deliver the original and two copies of the application by 4:30 p.m. (Washington, DC time) on the deadline date to: U.S. Department of Education, Application Control Center, Attention: (CFDA # 84.219), Room # 3633, Regional Office Building # 3, 7th and D Streets, SW., Washington, DC.

(b) An applicant must show one of the following as proof of mailing:

(1) A legibly dated U.S. Postal Service postmark.

(2) A legible mail receipt with the date of mailing stamped by the U.S. Postal Service.

(3) A dated shipping label, invoice, or receipt from a commercial carrier.

(4) Any other proof of mailing acceptable to the Secretary.

(c) If an application is mailed through the U.S. Posal Service, the Secretary does not accept either of the following as proof of mailing:

(1) A private metered postmark.

(2) A mail receipt that is not dated by the U.S. Postal Service.

Notes: (1) The U.S. Postal Service does not uniformly provide a dated postmark. Before relying on this method, an applicant should check with its local post office.

(2) An applicant wishing to know that its application has been received by the Department must include with the application a stamped, self-addressed postcard containing the CFDA number and title of this program.

(3) The applicant must indicate on the envelope and—if not provided by the Department—in Item 10 of the Application for Federal Assistance (Standard Form 424) the CFDA number—and letter, if any—of the competition under which the application is being submitted.

Application Instructions and Forms

The appendix to this application is divided into three parts plus a statement regarding estimated public reporting burden and various assurances and certifications. These parts and additional materials are organized in the same manner that the submitted application should be organized. The parts and additional materials are as follows:

Part I: Application for Federal Assistance (Standard Form 424 (Rev. 4–88)) and instructions.

Part II: Budget Information—Non-Construction Programs (Standard Form 424A) and instructions.

Part III: Application Narrative.

Additional Materials:

Estimated Public Reporting Burden.

Assurances—Non-Construction Programs (Standard Form 424B).

Certification regarding Debarment, Suspension, and Other Responsibility Matters: Primary Covered Transactions (ED Form GCS–008) and instructions.

Certification regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion: Lower Tier Covered Transactions (ED Form GCS–009) and instructions. (Note: ED Form GCS–009 is intended for the use of grantees and should not be transmitted to the Department.)

Certification Regarding Drug-Free Workplace Requirements: Grantees Other than Individuals (ED 80-0004).

An applicant may submit information on a photostatic copy of the application and budget forms, the assurances, and the certifications. However, the application form, the assurances, and the certifications must each have an original signature. No grant may be awarded unless a completed application form has been received.

FOR FURTHER INFORMATION CONTACT: Dr. Donald N. Bigelow, Office of Higher Education Programs, U.S. Department of Education, Room 3082, (202) 732-5596, ROB-3, Mail Station 5131, 400 Maryland Avenue, SW., Washington, DC 20202.

Program Authority: 20 U.S.C. 1018-1018f.

Dated: August 28, 1989.

James B. Williams,

Acting Assistant Secretary for Postsecondary Education.

Standard Form 424 (REV 4-88)
Prescribed by OMB Circular A-102

Authorized for Local Reproduction

INSTRUCTIONS FOR THE SF 424

This is a standard form used by applicants as a required facesheet for preapplications and applications submitted for Federal assistance. It will be used by Federal agencies to obtain applicant certification that States which have established a review and comment procedure in response to Executive Order 12372 and have selected the program to be included in their process, have been given an opportunity to review the applicant's submission.

Item: Entry:

1. Self-explanatory.
2. Date application submitted to Federal agency (or State if applicable) & applicant's control number (if applicable).
3. State use only (if applicable).
4. If this application is to continue or revise an existing award, enter present Federal identifier number. If for a new project, leave blank.
5. Legal name of applicant, name of primary organizational unit which will undertake the assistance activity, complete address of the applicant, and name and telephone number of the person to contact on matters related to this application.
6. Enter Employer Identification Number (EIN) as assigned by the Internal Revenue Service.
7. Enter the appropriate letter in the space provided.
8. Check appropriate box and enter appropriate letter(s) in the space(s) provided:
   - —"New" means a new assistance award.
   - —"Continuation" means an extension for an additional funding/budget period for a project with a projected completion date.
   - —"Revision" means any change in the Federal Government's financial obligation or contingent liability from an existing obligation.
9. Name of Federal agency from which assistance is being requested with this application.
10. Use the Catalog of Federal Domestic Assistance number and title of the program under which assistance is requested.
11. Enter a brief descriptive title of the project. if more than one program is involved, you should append an explanation on a separate sheet. If appropriate (e.g., construction or real property projects), attach a map showing project location. For preapplications, use a separate sheet to provide a summary description of this project.

Item: Entry:

12. List only the largest political entities affected (e.g., State, counties, cities).
13. Self-explanatory.
14. List the applicant's Congressional District and any District(s) affected by the program or project.
15. Amount requested or to be contributed during the first funding/budget period by each contributor. Value of in-kind contributions should be included on appropriate lines as applicable. If the action will result in a dollar change to an existing award, indicate *only* the amount of the change. For decreases, enclose the amounts in parentheses. If both basic and supplemental amounts are included, show breakdown on an attached sheet. For multiple program funding, use totals and show breakdown using same categories as item 15.
16. Applicants should contact the State Single Point of Contact (SPOC) for Federal Executive Order 12372 to determine whether the application is subject to the State intergovernmental review process.
17. This question applies to the applicant organization, not the person who signs as the authorized representative. Categories of debt include delinquent audit disallowances, loans and taxes.
18. To be signed by the authorized representative of the applicant. A copy of the governing body's authorization for you to sign this application as official representative must be on file in the applicant's office. (Certain Federal agencies may require that this authorization be submitted as part of the application.)

INSTRUCTIONS FOR THE SF-424A

General Instructions

This form is designed so that application can be made for funds from one or more grant programs. In preparing the budget, adhere to any existing Federal grantor agency guidelines which prescribe how and whether budgeted amounts should be separately shown for different functions or activities within the program. For some programs, grantor agencies may require budgets to be separately shown by function or activity. For other programs, grantor agencies may require a breakdown by function or activity. Sections A,B,C, and D should include budget estimates for the whole project except when applying for assistance which requires Federal authorization in annual or other funding period increments. In the latter case, Sections A,B, C, and D should provide the budget for the first budget period (usually a year) and Section E should present the need for Federal assistance in the subsequent budget periods. All applications should contain a breakdown by the object class categories shown in Lines a-k of Section B.

Section A. Budget Summary
Lines 1-4, Columns (a) and (b)

For applications pertaining to a *single* Federal grant program (Federal Domestic Assistance Catalog number) and *not requiring* a functional or activity breakdown, enter on Line 1 under Column (a) the catalog program title and the catalog number in Column (b).

For applications pertaining to a *single* program *requiring* budget amounts by multiple functions or activities, enter the name of each activity or function on each line in Column (a), and enter the catalog number in Column (b). For applications pertaining to multiple programs where none of the programs require a breakdown by function or activity, enter the catalog program title on each line in *Column* (a) and the respective catalog number on each line in Column (b).

For applications pertaining to *multiple* programs where one or more programs *require* a breakdown by function or activity, prepare a separate sheet for each program requiring the breakdown. Additional sheets should be used when one form does not provide adequate space for all breakdown of data required. However, when more than one sheet is used, the first page should provide the summary totals by programs.

Lines 1-4, Columns (c) through (g.)

For new applications, leave Columns (c) and (d) blank. For each line entry in Columns (a) and (b), enter in Columns (e), (f), and (g) the appropriate amounts of funds needed to support the project for the first funding period (usually a year).

Lines 1-4, Columns (c) through (g.) (continued)

For continuing grant program applications, submit these forms before the end of each funding period as required by the grantor agency. Enter in Columns (c) and (d) the estimated amounts of funds which will remain unobligated at the end of the grant funding period only if the Federal grantor agency instructions provide for this. Otherwise, leave these columns blank. Enter in columns (e) and (f) the amounts of funds needed for the upcoming period. The amount(s) in Column (g) should be the sum of amounts in Columns (e) and (f).

For supplemental grants and changes to existing grants, do not use Columns (c) and (d). Enter in Column (e) the amount of the increase or decrease of Federal funds and enter in Column (f) the amount of the increase or decrease of non-Federal funds. In Column (g) enter the new total budgeted amount (Federal and non-Federal) which includes the total previous authorized budgeted amounts plus or minus, as appropriate, the amounts shown in Columns (e) and (f). The amount(s) in Column (g) should not equal the sum of amounts in Columns (e) and (f).

Line 5 — Show the totals for all columns used.

Section B Budget Categories

In the column headings (1) through (4), enter the titles of the same programs, functions, and activities shown on Lines 1-4, Column (a), Section A. When additional sheets are prepared for Section A, provide similar column headings on each sheet. For each program, function or activity, fill in the total requirements for funds (both Federal and non-Federal) by object class categories.

Lines 6a-i — Show the totals of Lines 6a to 6h in each column.

Line 6j – Show the amount of indirect cost.

Line 6k – Enter the total of amounts on Lines 6i and 6j. For all applications for new grants and continuation grants the total amount in column (5), Line 6k, should be the same as the total amount shown in Section A, Column (g), Line 5. For supplemental grants and changes to grants, the total amount of the increase or decrease as shown in Columns (1)-(4), Line 6k should be the same as the sum of the amounts in Section A, Columns (e) and (f) on Line 5.

INSTRUCTIONS FOR THE SF-424A *(continued)*

Line 7 – Enter the estimated amount of income, if any, expected to be generated from this project. Do not add or subtract this amount from the total project amount. Show under the program narrative statement the nature and source of income. The estimated amount of program income may be considered by the federal grantor agency in determining the total amount of the grant.

Section C. Non-Federal-Resources

Lines 8-11 – Enter amounts of non-Federal resources that will be used on the grant. If in-kind contributions are included, provide a brief explanation on a separate sheet.

> **Column (a)** – Enter the program titles identical to Column (a), Section A. A breakdown by function or activity is not necessary.
>
> **Column (b)** – Enter the contribution to be made by the applicant.
>
> **Column (c)** – Enter the amount of the State's cash and in-kind contribution if the applicant is not a State or State agency. Applicants which are a State or State agencies should leave this column blank.
>
> **Column (d)** – Enter the amount of cash and in-kind contributions to be made from all other sources.
>
> **Column (e)** – Enter totals of Columns (b), (c), and (d).

Line 12 — Enter the total for each of Columns (b)-(e). The amount in Column (e) should be equal to the amount on Line 5, Column (f), Section A.

Section D. Forecasted Cash Needs

Line 13 – Enter the amount of cash needed by quarter from the grantor agency during the first year.

Line 14 – Enter the amount of cash from all other sources needed by quarter during the first year.

Line 15 – Enter the totals of amounts on Lines 13 and 14.

Section E. Budget Estimates of Federal Funds Needed for Balance of the Project

Lines 16 - 19 – Enter in Column (a) the same grant program titles shown in Column (a), Section A. A breakdown by function or activity is not necessary. For new applications and continuation grant applications, enter in the proper columns amounts of Federal funds which will be needed to complete the program or project over the succeeding funding periods (usually in years). This section need not be completed for revisions (amendments, changes, or supplements) to funds for the current year of existing grants.

If more than four lines are needed to list the program titles, submit additional schedules as necessary.

Line 20 – Enter the total for each of the Columns (b)-(e). When additional schedules are prepared for this Section, annotate accordingly and show the overall totals on this line.

Section F. Other Budget Information

Line 21 – Use this space to explain amounts for individual direct object-class cost categories that may appear to be out of the ordinary or to explain the details as required by the Federal grantor agency.

Line 22 – Enter the type of indirect rate (provisional, predetermined, final or fixed) that will be in effect during the funding period, the estimated amount of the base to which the rate is applied, and the total indirect expense.

Line 23 – Provide any other explanations or comments deemed necessary.

BILLING CODE 4000-01-C

Instruction for Part III—Application Narrative

Before preparing the Application Narrative, an applicant should read carefully the description of the program and the selection criteria the Secretary uses to evaluate applications.

The Narrative should encompass each function or activity for which funds are being requested and should—

1. Begin with an Abstract; that is, a single page summary of the proposed project;
2. Describe the project in terms of each of the selection criteria in the order in which they are listed; and
3. Include in the Narrative, information that will assist the Secretary in reviewing the application by indicating as fully as possible how the relevant "assurances" (a) to (f) in the Description of the Program will be carried out. Clearly describe the course(s) to be offered, the related training for undergraduate tutors and the duties of student coordinators, if any; explain which community agencies will be cooperating and why, with information about their programs and their clients; finally, describe the management and logistics of the proposed project, whether or not it is new, and, if it is new, how it will be combined with pre-existing projects.

Please limit the Application Narrative to no more than 15 double-spaced, typed pages (on one side only).

Estimated Public Reporting Burden

Under terms of the Paperwork Reduction Act of 1980, as amended, and the regulations implementing that Act, the Department of Education invites comment on the public reporting burden in this collection of information. Public reporting burden for this collection of information is estimated to average four hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. You may send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to the U.S. Department of Education, Information Management and Compliance Division, Washington, DC 20202–4651; and to the Office of Management and Budget, Paperwork Reduction Project 1840–0618, Washington, DC 20503.

(Information collection approved under OMB control number 1840–0618. Expiration date: 3/31/1992.)

Student Literacy Corps Program
Program Assurances

As the duly authorized representative of the IHE applicant, I certify that the applicant will comply with all statutory and regulatory requirements applicable to this program and provide specific program assurances that:

a. Its grant will be used to cover an IHE's costs of participation in the Student Literacy Corps Program for which assistance is sought, including evaluation and stipends for student coordinators, and funds made available will not be used for the payment of stipends or salaries to tutors, in accordance with the USES OF FUNDS provision in the authorizing legislation (20 U.S.C. 1018b);

b. It will provide literacy tutoring services in structured classroom settings supervised by qualified personnel in one or more public community agencies in the community in which it is located which serve educationally or economically disadvantaged individuals (the term "public community agency" means an established community agency with an established program of instruction such as elementary and secondary schools, Head Start Centers, prisons, agencies serving youth, and agencies serving the handicapped, including disabled veterans).

c. It will offer one or more courses for academic credit (in such academic areas as the social sciences, economics or education) designed to combine formal study with undergraduates' experience as literacy tutors;

d. As a condition of receiving credit for the courses of instruction referred to in paragraph (c) above, undergraduates will perform not less than six hours or voluntary, uncompensated service each week of the academic term in a public community agency as tutors in its educational or literacy programs;

e. The tutoring service referred to in paragraph (d) above will be supplementary both to the IHE's regular academic program and the existing instructional services offered by the community service learning programs; and

f. It will make arrangements for adequate training of volunteers, depending upon available resources, which may include the training of student coordinators to assist in the process of preparing and placing undergraduate as tutors in community service learning programs.

ASSURANCES — NON-CONSTRUCTION PROGRAMS

Note: Certain of these assurances may not be applicable to your project or program. If you have questions, please contact the awarding agency. Further, certain Federal awarding agencies may require applicants to certify to additional assurances. If such is the case, you will be notified.

As the duly authorized representative of the applicant I certify that the applicant:

1. Has the legal authority to apply for Federal assistance, and the institutional, managerial and financial capability (including funds sufficient to pay the non-Federal share of project costs) to ensure proper planning, management and completion of the project described in this application.

2. Will give the awarding agency, the Comptroller General of the United States, and if appropriate, the State, through any authorized representative, access to and the right to examine all records, books, papers, or documents related to the award; and will establish a proper accounting system in accordance with generally accepted accounting standards or agency directives.

3. Will establish safeguards to prohibit employees from using their positions for a purpose that constitutes or presents the appearance of personal or organizational conflict of interest, or personal gain.

4. Will initiate and complete the work within the applicable time frame after receipt of approval of the awarding agency.

5. Will comply with the Intergovernmental Personnel Act of 1970 (42 U.S.C. §§ 4728-4763) relating to prescribed standards for merit systems for programs funded under one of the nineteen statutes or regulations specified in Appendix A of OPM's Standards for a Merit System of Personnel Administration (5 C.F.R. 900, Subpart F).

6. Will comply with all Federal statutes relating to nondiscrimination. These include but are not limited to: (a) Title VI of the Civil Rights Act of 1964 (P.L. 88-352) which prohibits discrimination on the basis of race, color or national origin; (b) Title IX of the Education Amendments of 1972, as amended (20 U.S.C. §§ 1681-1683, and 1685-1686), which prohibits discrimination on the basis of sex; (c) Section 504 of the Rehabilitation Act of 1973, as amended (29 U.S.C. § 794), which prohibits discrimination on the basis of handicaps; (d) the Age Discrimination Act of 1975, as amended (42 U.S.C.§§ 6101-6107), which prohibits discrimination on the basis of age; (e) the Drug Abuse Office and Treatment Act of 1972 (P.L. 92-255), as amended, relating to nondiscrimination on the basis of drug abuse; (f) the Comprehensive Alcohol Abuse and Alcoholism Prevention, Treatment and Rehabilitation Act of 1970 (P.L. 91-616), as amended, relating to nondiscrimination on the basis of alcohol abuse or alcoholism; (g) §§ 523 and 527 of the Public Health Service Act of 1912 (42 U.S.C. 290 dd-3 and 290 ee-3), as amended, relating to confidentiality of alcohol and drug abuse patient records; (h) Title VIII of the Civil Rights Act of 1968 (42 U.S.C. § 3601 et seq.), as amended, relating to nondiscrimination in the sale, rental or financing of housing; (i) any other nondiscrimination provisions in the specific statute(s) under which application for Federal assistance is being made; and (j) the requirements of any other nondiscrimination statute(s) which may apply to the application.

7. Will comply, or has already complied, with the requirements of Titles II and III of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (P.L. 91-646) which provide for fair and equitable treatment of persons displaced or whose property is acquired as a result of Federal or federally assisted programs. These requirements apply to all interests in real property acquired for project purposes regardless of Federal participation in purchases.

8. Will comply with the provisions of the Hatch Act (5 U.S.C. §§ 1501-1508 and 7324-7328) which limit the political activities of employees whose principal employment activities are funded in whole or in part with Federal funds.

9. Will comply, as applicable, with the provisions of the Davis-Bacon Act (40 U.S.C. §§ 276a to 276a-7), the Copeland Act (40 U.S.C. § 276c and 18 U.S.C. §§ 874), and the Contract Work Hours and Safety Standards Act (40 U.S.C. §§ 327-333), regarding labor standards for federally assisted construction subagreements.

Standard Form 424B (4-88)
Prescribed by OMB Circular A-102

Authorized for Local Reproduction

10. Will comply, if applicable, with flood insurance purchase requirements of Section 102(a) of the Flood Disaster Protection Act of 1973 (P.L. 93-234) which requires recipients in a special flood hazard area to participate in the program andto purchase flood insurance if the total cost of insurable construction and acquisition is $10,000 or more.
11. Will comply with environmental standards which may be prescribed pursuant to the following: (a) institution of environmental quality control measures under the National Environmental Policy Act of 1969 (P.L. 91-190) and Executive Order (EO) 11514; (b) notification of violating facilities pursuant to EO 11738; (c) protection of wetlands pursuant to EO 11990; (d) evaluation of flood hazards in floodplains in accordance with EO 11988; (e) assurance of project consistency with the approved State management program developed under the Coastal Zone Management Act of 1972 (16 U.S.C. §§ 1451 et seq.); (f) conformity of Federal actions to State (Clear Air) Implementation Plans under Section 176(c) of the Clear Air Act of 1955, as amended (42 U.S.C. § 7401 et seq.); (g) protection of underground sources of drinking water under the Safe Drinking Water Act of 1974, as amended, (P.L. 93-523); and (h) protection of endangered species under the Endangered Species Act of 1973, as amended, (P.L. 93-205).
12. Will comply with the Wild and Scenic Rivers Act of 1968 (16 U.S.C. §§ 1271 et seq.) related to protecting components or potential components of the national wild and scenic rivers system.
13. Will assist the awarding agency in assuring compliance with Section 106 of the National Historic Preservation Act of 1966, as amended (16 U.S.C. 470), EO 11593 (identification and protection of historic properties), and the Archaeological and Historic Preservation Act of 1974 (16 U.S.C. 469a-1 et seq.).
14. Will comply with P.L. 93-348 regarding the protection of human subjects involved in research, development, and related activities supported by this award of assistance.
15. Will comply with the Laboratory Animal Welfare Act of 1966 (P.L. 89-544, as amended, 7 U.S.C. 2131 et seq.) pertaining to the care, handling, and treatment of warm blooded animals held for research, teaching, or other activities supported by this award of assistance.
16. Will comply with the Lead-Based Paint Poisoning Prevention Act (42 U.S.C. §§ 4801 et seq.) which prohibits the use of lead based paint in construction or rehabilitation of residence structures.
17. Will cause to be performed the required financial and compliance audits in accordance with the Single Audit Act of 1984.
18. Will comply with all applicable requirements of all other Federal laws, executive orders, regulations and policies governing this program.

Certification Regarding Debarment, Suspension, and Other Responsibility Matters Primary Covered Transactions

This certification is required by the regulations implementing Executive Order 12549, Debarment and Suspension, 34 CFR Part 85, Section 85.510, Participants' responsibilities. The regulations were published as Part VII of the May 26, 1988 Federal Register (pages 19160-19211). Copies of the regulations may be obtained by contacting the U.S. Department of Education, Grants and Contracts Service, 400 Maryland Avenue, S.W. (Room 3633 GSA Regional Office Building No. 3), Washington, D.C. 20202-4725, telephone (202) 732-2505.

(BEFORE COMPLETING CERTIFICATION, READ INSTRUCTIONS ON REVERSE)

(1) The prospective primary participant certifies to the best of its knowledge and belief, that it and its principals:

(a) Are not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from covered transactions by any Federal department or agency;

(b) Have not within a three-year period preceding this proposal been convicted of or had a civil judgment rendered against them for commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State or local) transaction or contract under a public transaction; violation of Federal or State antitrust statutes or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements, or receiving stolen property;

(c) Are not presently indicted for or otherwise criminally or civilly charged by a governmental entity (Federal, State or local) with commission of any of the offenses enumerated in paragraph (1)(b) of this certification; and

(d) Have not within a three-year period preceding this application/proposal had one or more public transactions (Federal, State or local) terminated for cause or default.

(2) Where the prospective primary participant is unable to certify to any of the statements in this certification, such prospective participant shall attach an explanation to this proposal.

Organization Name PR/Award Number or Project Name

Name and Title of Authorized Representative

ED Form GCS-008, (REV.12/88)

Instructions for Certification

1. By signing and submitting this proposal, the prospective primary participant is providing the certification set out below.

2. The inability of a person to provide the certification required below will not necessarily result in denial of participation in this covered transaction. The prospective participant shall submit an explanation of why it cannot provide the certification set out below. The certification or explanation will be considered in connection with the department or agency's determination whether to enter into this transaction. However, failure of the prospective primary participant to furnish a certification or an explanation shall disqualify such person from participation in this transaction.

3. The certification in this clause is a material representation of fact upon which reliance was placed when the department or agency determined to enter into this transaction. If it is later determined that the prospective primary participant knowingly rendered an erroneous certification, in addition to other remedies available to the Federal Government, the department or agency may terminate this transaction for cause or default.

4. The prospective primary participant shall provide immediate written notice to the department or agency to whom this proposal is submitted if at any time the prospective primary participant learns that its certification was erroneous when submitted or has become erroneous by reason of changed circumstances.

5. The terms "covered transaction," "debarred," "suspended," "ineligible," "lower tier covered transaction," "participant," "person," "primary covered transaction," "principal," "proposal," and "voluntarily excluded," as used in this clause, have the meanings set out in the Definitions and Coverage sections of the rules implementing Executive Order 12549. You may contact the department or agency to which this proposal is being submitted for assistance in obtaining a copy of those regulations.

6. The prospective primary participant agrees by submitting this proposal that, should the proposed covered transaction be entered into, it shall not knowingly enter into any lower tier covered transaction with a person who is debarred, suspended, declared ineligible, or voluntarily excluded from participation in this covered transaction, unless authorized by the department or agency entering into this transaction.

7. The prospective primary participant further agrees by submitting this proposal that it will include the clause titled "Certification Regarding Debarment, Suspension, Ineligibility, and Voluntary Exclusion–Lower Tier Covered Transactions," provided by the department or agency entering into this covered transaction, without modification, in all lower tier covered transactions and in all solicitations for lower tier covered transactions.

8. A participant in a covered transaction may rely upon a certification of a prospective participant in a lower tier covered transaction that it is not debarred, suspended, ineligible, or voluntarily excluded from the covered transaction, unless it knows that the certification is erroneous. A participant may decide the method and frequency by which it determines the eligibility of its principals. Each participant may, but is not required to, check the Nonprocurement List.

9. Nothing contained in the foregoing shall be construed to require establishment of a system of records in order to render in good faith the certification required by this clause. The knowledge and information of a participant is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

10. Except for transactions authorized under paragraph 6 of these instructions, if a participant in a covered transaction knowingly enters into a lower tier covered transaction with a person who is suspended, debarred, ineligible, or voluntarily excluded from participation in this transaction, in addition to other remedies available to the Federal Government, the department or agency may terminate this transaction for cause or default.

Certification Regarding Debarment, Suspension, Ineligibility and Voluntary Exclusion Lower Tier Covered Transactions

This certification is required by the regulations implementing Executive Order 12549, Debarment and Suspension, 34 CFR Part 85, Section 85.510, Participants' responsibilities. The regulations were published as Part VII of the May 26, 1988 Federal Register (pages 19160-19211). Copies of the regulations may be obtained by contacting the person to which this proposal is submitted.

(BEFORE COMPLETING CERTIFICATION, READ INSTRUCTIONS ON REVERSE)

(1) The prospective lower tier participant certifies, by submission of this proposal, that neither it nor its principals are presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from participation in this transaction by any Federal department or agency.

(2) Where the prospective lower tier participant is unable to certify to any of the statements in this certification, such prospective participant shall attach an explanation to this proposal.

Instructions for Certification

1. By signing and submitting this proposal, the prospective lower tier participant is providing the certification set out below.

2. The certification in this clause is a material representation of fact upon which reliance was placed when this transaction was entered into. If it is later determined that the prospective lower tier participant knowingly rendered an erroneous certification, in addition to other remedies available to the Federal Government, the department or agency with which this transaction originated may pursue available remedies, including suspension and/or debarment.

3. The prospective lower tier participant shall provide immediate written notice to the person to which this proposal is submitted if at any time the prospective lower tier participant learns that its certification was erroneous when submitted or has become erroneous by reason of changed circumstances.

4. The terms "covered transaction," "debarred," "suspended," "ineligible," "lower tier covered transaction," "participant," "person," "primary covered transaction," "principal," "proposal," and "voluntarily excluded," as used in this clause, have the meanings set out in the Definitions and Coverage sections of rules implementing Executive Order 12549. You may contact the person to which this proposal is submitted for assistance in obtaining a copy of those regulations.

5. The prospective lower tier participant agrees by submitting this proposal that, should the proposed covered transaction be entered into, it shall not knowingly enter into any lower tier covered transaction with a person who is debarred, suspended, declared ineligible, or voluntarily excluded from participation in this covered transaction, unless authorized by the department or agency with which this transaction originated.

6. The prospective lower tier participant further agrees by submitting this proposal that it will include the clause titled "Certification Regarding Debarment, Suspension, Ineligibility, and Voluntary Exclusion–Lower Tier Covered Transactions," without modification, in all lower tier covered transactions and in all solicitations for lower tier covered transactions.

7. A participant in a covered transaction may rely upon a certification of a prospective participant in a lower tier covered transaction that it is not debarred, suspended, ineligible, or voluntarily excluded from the covered transaction, unless it knows that the certification is erroneous. A participant may decide the method and frequency by which it determines the eligibility of its principals. Each participant may, but is not required to, check the Nonprocurement List.

8. Nothing contained in the foregoing shall be construed to require establishment of a system of records in order to render in good faith the certification required by this clause. The knowledge and information of a participant is not required to exceed that which is normally possessed by a prudent person in the ordinary course of business dealings.

9. Except for transactions authorized under paragraph 5 of these instructions, if a participant in a covered transaction knowingly enters into a lower tier covered transaction with a person who is suspended, debarred, ineligible, or voluntarily excluded from participation in this transaction, in addition to other remedies available to the Federal Government, the department or agency with which this transaction originated may pursue available remedies, including suspension and/or debarment.

ED Form GCS-009, (REV. 12/88)

Certification Regarding Drug-Free Workplace Requirements Grantees Other Than Individuals

This certification is required by the regulations implementing the Drug-Free Workplace Act of 1988, 34 CFR Part 85, Subpart F. The regulations, published in the January 31, 1989 Federal Register, require certification by grantees, prior to award, that they will maintain a drug-free workplace. The certification set out below is a material representation of fact upon which reliance will be placed when the agency determines to award the grant. False certification or violation of the certification shall be grounds for suspension of payments, suspension or termination of grants, or governmentwide suspension or debarment (see 34 CFR Part 85, Sections 85.615 and 85.620).

The grantee certifies that it will provide a drug-free workplace by:

(a) Publishing a statement notifying employees that the unlawful manufacture, distribution, dispensing, possession or use of a controlled substance is prohibited in the grantee's workplace and specifying the actions that will be taken against employees for violation of such prohibition;

(b) Establishing a drug-free awareness program to inform employees about–

 (1) The dangers of drug abuse in the workplace;
 (2) The grantee's policy of maintaining a drug-free workplace;
 (3) Any available drug counseling, rehabilitation, and employee assistance programs; and
 (4) The penalties that may be imposed upon employees for drug abuse violations occurring in the workplace;

(c) Making it a requirement that each employee to be engaged in the performance of the grant be given a copy of the statement required by paragraph (a);

(d) Notifying the employee in the statement required by paragraph (a) that, as a condition of employment under the grant, the employee will–

 (1) Abide by the terms of the statement; and
 (2) Notify the employer of any criminal drug statute conviction for a violation occurring in the workplace no later than five days after such conviction;

(e) Notifying the agency within ten days after receiving notice under subparagraph (d)(2) from an employee or otherwise receiving actual notice of such conviction;

(f) Taking one of the following actions, within 30 days of receiving notice under subparagraph (d)(2), with respect to any employee who is so convicted–

 (1) Taking appropriate personnel action against such an employee, up to and including termination; or
 (2) Requiring such employee to participate satisfactorily in a drug abuse assistance or rehabilitation program approved for such purposes by a Federal, State, or local health, law enforcement, or other appropriate agency;

(g) Making a good faith effort to continue to maintain a drug-free workplace through implementation of paragraphs (a), (b), (c), (d), (e) and (f).

Medicare Program; Medicare Coverage of Screening Mammography

AGENCY: Health Care Financing Administration (HCFA), HHS.

ACTION: Proposed rule.

SUMMARY: This proposed rule would implement section 204 of the Medicare Catastrophic Coverage Act of 1988, which provides limited coverage for screening mammography services. The rule would amend current Medicare regulations to set forth payment limitations and conditions for coverage of screening mammography. The conditions would consist of quality standards to assure the safety and accuracy of screening mammography services performed by qualified physicians and other suppliers of these services.

DATE: To be considered, comments must be mailed or delivered to the appropriate address, as provided below, and must be received by 5:00 p.m. on October 31, 1989.

ADDRESSES: Mail comments to the following address:

Health Care Financing Administration, Department of Health and Human Services, Attention: BERC–619–P, P.O. Box 26676, Baltimore, Maryland 21207.

If you prefer, you may deliver your comments to one of the following addresses:

Room 309–G, Hubert H. Humphrey Building, 200 Independence Ave., SW., Washington, DC, or,

Room 132, East High Rise Building, 6325 Security Boulevard, Baltimore, Maryland.

Due to staffing and resource limitations, we cannot accept facsimile (FAX) copies of comments.

If comments concern information collection or recordkeeping requirements, please address a copy of comments to:

Office of Management and Budget, Office of Information and Regulatory Affairs, Room 3208, New Executive Office Building, Washington, DC 20503, Attention: Allison Herron.

In commenting, please refer to file code BERC–619–P. Comments received timely will be available for public inspection as they are received, beginning approximately three weeks after publication of this document, in Room 309–G of the Department's offices at 200 Independence Ave., SW., Washington, DC, on Monday through Friday of each week from 8:30 a.m. to 5:00 p.m. (phone: 202–245–7890).

William Morse (Payment Limits) (301) 966–4520

SUPPLEMENTARY INFORMATION:

I. Background

Section 1862(a) of the Social Security Act (the Act) lists items and services excluded from Medicare coverage. Paragraph (a)(7) of that section identifies routine physical checkups as excluded services, and it is on this basis that screening mammography has been excluded from Medicare coverage. This policy is reflected in Medicare regulations at 42 CFR 405.310(a), which implement the statute by excluding coverage for routine physical checkups. In addition, current coverage instructions setting forth the routine physical checkup exclusion are found in the Medicare Carriers Manual (HCFA Pub. 14), the part A Intermediary Manual (HCFA Pub. 13), the Hospital Manual (HCFA Pub. 10), the Skilled Nursing Facility Manual (HCFA Pub. 12), and the Home Health Agency Manual (HCFA Pub. 11). Current coverage instructions on payment for diagnostic mammograms (as distinguished from screening mammograms) are included in section 50–21 of the Medicare Coverage Issues Manual (HCFA Pub. 6).

Section 204 of the Medicare Catastrophic Coverage Act of 1988 (Pub. L. 100–360, enacted on July 1, 1988) amended sections 1833, 1834, 1861, 1862, 1863, 1864, 1865, 1902, and 1915 of the Act to provide coverage of screening mammography (including a physician's interpretation of the images or films produced by the radiologic procedure) effective January 1, 1990, subject to frequency limitations, quality standards, and special payment rules.

In the legislative history of Public Law 100–360, Congress expressed strong concern that steps be taken to ensure the quality of screening mammography services. In the opening statement of the hearing on Medicare coverage for mammography, Representative Fortney H. Stark said, "To assure that Medicare beneficiaries receive the highest quality of care, my bill requires the Secretary to establish conditions of participation for facilities offering mammography procedures" (Report of the Subcommittee on Health of the Committee on Ways and Means, House of Representatives, H.R. Rep. No. 100–47, 100th Congress, 1st Session 7 (1987)). In testimony before the committee, other individuals and professional organizations in the health care community (the American College of Radiology, the American Cancer Society, and the National Women's Health Network, among others) also expressed concern regarding the quality of mammography services. For example, Alan C. Sartorelli, Ph.D., Alfred Gilman Professor of Pharmacology and Director of the Yale Comprehensive Cancer Center of the Yale University School of Medicine, and also President of the Association of American Cancer Institutes, testified that in constructing a Medicare screening mammography program that will be successful in the early detection of breast cancer, "* * * it is critical that quality control of the examinations be included". At the request of the Congress, the Office of Technology Assessment (OTA) published a report on the subject ("Breast Cancer Screening for Medicare Beneficiaries: Effectiveness, Costs to Medicare and Medical Resources Required", p. 11, November 1987). In this report, OTA identifies "the need to monitor the quality of screening service * * * if Medicare expects to restrict the amount to be reimbursed to providers of screening services", and says that "the rapid rise in new freestanding breast screening facilities is likely to raise concerns about the quality of the services provided" (p. 12). This concern about the quality of screening mammography has been strengthened by the May 1989 report of the U.S. Preventive Services Task Force to the Secretary, entitled "Guide to Clinical Preventive Services". Citing four studies, it concluded that, "Wide variation is found in the quality and consistency of mammography, as well as in the accuracy of interpretation, radiation exposure and cost" (p. 29).

In response to this concern for the quality of screening mammography services, as well as to the congressional mandate for quality standards contained in section 1834(e)(3) of the Act, we are proposing comprehensive standards regarding equipment specifications, the qualifications of supervising and interpreting physicians and other personnel, safety measures, compliance with Federal, State, and local laws and regulations, the preservation and disposition of examination results and other records, and the need for an ongoing equipment quality assurance program.

We recognize that this approach to assuring the quality of screening mammography is not entirely consistent with our recent emphasis on using "outcome" or "performance" standards to assure the quality of provider services paid for under the Medicare program. Such as approach would be desirable in the screening mammography area, but it does not appear to be feasible at this time. An outcome oriented approach requires that certain methodologies such as a valid proficiency test be available to evaluate how well the goals established by regulation are being met. Some progress has been made in the development of a proficiency test for the performance of screening mammography examinations, primarily in the use of phantoms to evaluate the quality of the images being produced and in the development of other physics tests. However, we do not yet have a test for technologist positioning accuracy or for radiologist interpretative skills. Neither do we have a carefully evaluated clinical comparison for the physics tests now in use. Some research, sponsored by the Centers for Disease Control (CDC) and the Food and Drug Administration (FDA), is now under way that may contribute to the development of some of the missing elements. This research and efforts by professional groups may eventually lead to a comprehensive valid proficiency test that will permit use of an outcome oriented approach in screening mammography. For the present, however, we believe that it will be necessary to require facilities to meet specific requirements that are known to contribute to effective mammography examinations and their interpretations. The proposed standards reflect this approach. However, we request comments on the availability and accuracy of proficiency testing for the elements noted above.

II. Provisions of the Regulations

This proposed rule would implement section 204 of Public Law 100–360 by setting forth payment limitations and establishing conditions for coverage of screening mammography to ensure the safety and accuracy of the screening process.

Thus, we would specify an exception to the list of examples of routine physical checkups excluded from coverage at 42 CFR 405.310(a)(1). The exception would be for screening mammography (including a physician's interpretation of the results) that is consistent with the payment requirements proposed at § 410.34 and that meets the conditions for coverage that we would specify under subpart B of a new 42 CFR part 494.

Coverage of screening mammography would be provided under Medicare Part B only; a reasonable interpretation of the law does not support Part A coverage of the procedure.

A. Payment Limitations

We would add a new § 405.534 to set forth limitations on payment for screening mammography services. There would be three categories of billing for mammography services, as is the case with other radiological services. Bills may be for the professional component of mammography services (that is, for the physician's interpretation of the results of the examination), for the technical component (all other services), or for both (global). This new section would establish payment limits for each of those categories. For purposes of payment for screening mammography services, we propose to weight the professional and technical components in the same manner that we did in establishing fee schedules for radiologists' services that were published in the **Federal Register** on March 2, 1989 (54 FR 8994–9024). Thus, we propose that, at this time, the professional component would represent 37 percent of the total amount for the complete service and the technical component would represent 63 percent. If the relationship between these values changes at a later date, we would modify § 405.534 to reflect the change.

Billing for screening mammography services would be in accordance with general Medicare payment policy for radiology services furnished by physicians in providers (§§ 405.554 through 405.555) and with policy governing payment under the fee schedule for radiologist services furnished in all settings (§§ 405.530 through 405.533). That is, a global charge may be made for services furnished in settings other than hospitals or the technical and professional components may be billed separately. However, global billing is not permitted for services furnished in hospital outpatient departments. Furthermore, the technical component of screening mammography services furnished in hospital outpatient departments would not be paid through the special methodology set forth in § 413.122, which is the generally applicable policy for payment of hospital outpatient radiology services. We propose that screening mammography services be excluded from the provision. Proposed payment for these services is discussed below.

Section 405.534(a) would set the limitations for payment of both the professional and technical components through global billing for services furnished in all settings. As discussed above, global fees may not be billed for screening mammography services furnished in hospitals. For screening mammography services furnished in all settings when a global charge is appropriate, the amount of payment subject to the deductible would be equal to 80 percent of the least of the—

- Actual charge for the service;
- Amount determined with respect to the professional and technical components for the service under §§ 405.530 through 405.533, which set forth the methodology for computing payments for radiologist services; or
- Limit for the procedure. For services furnished in calendar year 1990, the limit would be $50. On January 1 of each subsequent year, the limit would be updated by the percentage increase in the Medicare Economic Index (MEI).

In paragraph (b) of proposed § 405.534, we would set forth the limits for payment of the professional component. For services furnished in all settings in which the professional component is billed separately, the amount of payment for that professional component subject to the deductible would be equal to 80 percent of the least of the—

- Actual charge for the professional component of the service;
- Amount determined with respect to the professional component for the service under §§ 405.530 through 405.533, which set forth the methodology for computing payments for radiologist services; or
- Professional portion of the screening mammography limit. This amount is determined by multiplying the screening mammography limit (that is, $50 in calendar year 1990) by the same percentage that the professional relative value for screening mammography bears to the global relative value for screening mammography under §§ 405.530 through 405.533, or 37 percent. On January 1 of each subsequent year, the screening mammography limit would be updated by the percentage increase in the MEI.

In paragraph (c) of the proposed § 405.534, we would set forth the limitations for payment of the technical component. We propose the following:

- For services furnished in all settings in which the technical component is billed separately, the limit for that technical component subject to the deductible would be equal to 80 percent of the least of the—
  —Actual charge for the technical component of the service;

—Amount determined with respect to the technical component for the service under §§ 405.530 through 405.533; or

—Technical portion of the screening mammography limit. This amount is determined by multiplying the screening mammography limit (that is, $50 in calendar year 1990) by the same percentage that the technical relative value for screening mammography bears to the global relative value for screening mammography under §§ 405.530 through 405.533, or 63 percent. On January 1 of each subsequent year, the overall limit would be updated by the percentage increase in the MEI.

- For services furnished in the outpatient departments of hospitals, the limit for that technical component subject to the deductible would be the same as described above.

We would also add a new § 405.535 to stipulate that, if screening mammography services are furnished to a beneficiary by a nonparticipating physician or supplier, a special limiting charge applies to the charges made to the beneficiary. The limiting charge would be the lesser of the amount determined using § 405.533 (rules for nonparticipating physicians furnishing radiology services) or the limit for nonparticipating suppliers set forth in section 204 of Public Law 100–360. In 1990, this limit would be 125 percent of the payment limit; in 1991, 120 percent; and, beginning January 1, 1992, 115 percent of the payment limit.

B. Coverage Limitations and Conditions

We would revise § 410.1(a), which sets forth the statutory basis for part B benefits, by adding section 1834 of the Act. Section 1834 provides for part B coverage of screening mammography services. We would revise § 410.10 to add a paragraph (t) reading "Screening mammography services". This would add screening mammography services to the listing of "medical and other health services" that part B covers.

We would redesignate the current § 410.34 as § 410.35. The new § 410.34 would set forth conditions for coverage for and limitations on coverage for screening mammography services. It would define screening mammography as a radiologic procedure furnished to a woman for the purpose of early detection of breast cancer, including a physician's interpretation of the results of the procedure. Section 410.34(a) would explicitly state that coverage is available for screening mammography services only if furnished by a screening mammography supplier that meets the conditions for coverage of screening mammography proposed in subpart B of part 494.

According to the Report of the Committee of Conference that accompanied Public Law 100–360 (H.R. Rep. No. 100–661, 100th Congress, 2d Session 171 (1988)), the conferees "understand that a bilateral four-view procedure is currently considered to be the standard of care in the United States for screening mammography * * * [and] therefore anticipate that this would be initially included in the quality standards to be developed by the Secretary as a requirement for coverage". Accordingly, § 410.34(b)(1) would specify that the service must be a bilateral four-view exposure (that is, a cranio-caudal and a medial lateral oblique view of each breast) furnished by a supplier that meets the conditions for coverage of screening mammography services.

Additionally, § 410.34 would set forth the following restrictions imposed by section 1834(e)(2) of the Act:

- No payment may be made for screening mammography performed on an asymptomatic woman under 35 years of age (§ 410.34(b)(2)).
- Payment may be made for only 1 screening mammography performed on an asymptomatic woman over 34 years of age, but under 40 years of age (§ 410.34(b)(3)).
- For an asymptomatic woman over 39 years of age, but under 50 years of age, the following coverage guidelines apply:

—Payment may be made for a screening mammography performed after at least 11 months have passed since the last screening mammography, if the woman has a high risk of developing breast cancer, that is, if she has—

—A personal history of breast cancer;

—A personal history of biopsy-proven benign breast disease;

—A mother, sister, or daughter who has had breast cancer; or

—Not given birth prior to age 30.

—Payment may not be made for a screening mammography performed within the 23 months after the previous screening mammography if the above criteria do not apply (that is, the woman is not at a high risk of developing breast cancer) (§ 410.34(b)(4)).

- For an asymptomatic woman over 49 years of age, but under 65 years of age, payment may not be made for screening mammography performed within 11 months after a previous screening mammography (§ 410.34(b)(5)).
- For an asymptomatic woman over 64 years of age, payment may not be made for screening mammography performed within 23 months after a previous screening mammography (§ 410.34(b)(6)).

These proposed guidelines reflect the mandated provisions of the law, except that the factors indicating a high risk of developing breast cancer were identified based upon advice we received from the National Cancer Institute of the National Institutes of Health. The proposed guidelines do not include a requirement that the screen mammography radiologic procedure (as distinguished from the physician's interpretation) must be prescribed by a physician for a particular beneficiary in order for it to be covered under the benefit. The law does not specify it, and the legislative history is also silent as to the need for physician referral. As provided in section 1834(e)(2)(B) of the Act, added by section 204(b)(2) of Public Law 100–360, the guidelines may be revised by the Secretary on the basis of consultation with the National Cancer Institute, but not before January 1, 1992.

We intend to publish a separate regulation concerning current payment methods for hospital outpatient radiology services and other diagnostic procedures. We are proposing to exclude screening mammography services as described in § 410.34 from those payment methods.

We would add a new § 413.123 that would specify the payment method for screening mammography performed by hospitals on an outpatient basis.

We would add a new Part 494 entitled "Conditions for Coverage of Particular Services". Subpart A would be reserved for future use as "General Provisions", and Subpart B would specify "Conditions for Coverage of Screening Mammography". In proposing the conditions for coverage of screening mammography, we used part 405, subpart N (Conditions for Coverage ot Portable X-ray Services) as a model. Because of the similarity of services furnished and based on our experience with the portable X-ray benefit, we believe that some of the conditions for coverage of portable X-ray services furnish a sound basis upon which to develop similar conditions for coverage of screening mammography. The first condition for coverage under subpart B would be a general condition at § 494.50. It would provide that in order to be approved for participation in the Medicare program, a supplier of screening mammography must meet all the conditions set forth in subpart B with respect to individuals entitled to Medicare part B. Section 1834(e)(3) of the Act authorizes the Secretary to

establish safety and accuracy standards "under this Part", that is, under Medicare part B. All facilities (including participating providers) would have to meet all the safety and accuracy standards specified in the proposed regulations to qualify as screening mammography suppliers. Medicare participating hospitals, for instance, would not be considered to meet the proposed requirements solely because they are certified as participating providers. The second condition for coverage would be located at § 494.51. Using language similar to that used in § 405.1411 of subpart N, we would require compliance with Federal, State, and local laws and regulations by the supplier of screening mammography services. (Section 405.1411 requires compliance with Federal, State, and local laws as a condition for coverage of portable X-ray services.)

At a new § 494.52, we would establish a condition requiring supervision by a qualified physician. The language we would use is similar to that used in § 405.1412(a), which sets forth a physician supervision standard for coverage for portable X-ray services. We would establish a standard at § 494.52(a) to require that the screening mammography services must be supervised by a physician. Additionally, section 494.52(a), using language similar to that used in § 405.1412(b), would set forth the required qualifications of the physician supervisor. The new section would state that he or she must be a licensed doctor of medicine or licensed doctor of osteopathy who meets the requirements for the interpretation of the results of screening mammograms as specified in § 494.54. We would consider adequate supervision to be provided if the supervising physician meets the requirement proposed at § 494.52(b). Specifically, the supervising physician must certify annually that he or she has checked the procedural manuals and has observed monthly the operators' performance, that he or she has verified that the equipment and personnel meet applicable Federal, State, and local licensure and registration requirements, that safe operating procedures are used, and that all other requirements of part 494, subpart B are being met.

We would add a new § 494.54 to set forth the requirements governing the interpretation of the results (that is, films or images) of screening mammography as a condition for Medicare coverage, in accordance with section 1834(e)(3)(C) of the Act. This section of the Act requires that mammography results be interpreted by either a physician "who is certified as qualified to interpret radiological procedures by such an appropriate board as the Secretary specifies" or "who is certified as qualified to interpret screening mammography procedures by such a program as the Secretary recognizes in regulation, as assuring the qualifications of the individual with respect to such interpretation". Thus, under § 494.54(a), we would require that the results of all screening mammography be interpreted by a physician who meets either of the following certification requirements that we developed as a result of consultation with the FDA, the American College of Radiology (ACR), and the National Cancer Institute (NCI):

- The interpreting physician is certified by the American Board of Radiology or by the American Osteophathic Board of Radiology (§ 494.54(a)(1)).
- The interpreting physician is certified as qualified to interpret the results of a screening mammography procedures by an appropriate program that assures the qualifications of the individual (§ 494.54(a)(2)).

We are specifically soliciting suggestions from the public concerning alternate sources of certification or other appropriate programs that may be used to meet this requirement, and we will revise proposed § 494.54(a)(2), as appropriate, based on those comments.

Additionally, on the basis of consultation with the FDA, ACR, and NCI, we would require in § 494.54(b) that the interpreting physician meet certain experience and continuing education standards to ensure that the special skills required to interpret the results (that is, films or images) of screening mammography accurately are kept up-to-date. The results of a screening mammography procedure are very difficult to interpret accurately and require a physician's special skills. These skills need to be kept up-to-date through special training and experience that is recognized by the ACR in its own accreditation program. We understand that neither certification by the American Board of Radiology nor by the American Osteopathic Board of Radiology includes any assurance that interpreting physicians are keeping their skills up-to-date through continuing training and experience. The experience and continuing education standards we would require in § 494.54(b) follow:

- A physician first meeting the board certification standards or meeting other equivalent certification qualifications as outlined above before January 1, 1990 must also—

—Have read the results of an average of 10 or more screening or diagnostic mammographies per work week in the 6 months prior to January 1, 1990 (the effective date of the final rule);

—Have successfully completed a minimum of 40 hours of post-graduate instruction in mammography interpretation in the 24 months prior to January 1, 1990; and

—Have successfully completed a minimum of 40 hours of post-graduate instruction in mammography interpretation every 24 months after January 1, 1990.

—Continued to read the results of an average of 10 or more screening or diagnostic mammographies per work week after he or she begins to read screening mammographies for Medicare beneficiaries.

- A physician first meeting the board certification standards or meeting other equivalent certification qualifications as outlined above on or after January 1, 1990, must also—

—Have read the results of an average of 10 or more screening or diagnostic mammographies per work week in the 6 months before the date that he or she begins reading screening mammographies for Medicare beneficiaries;

—Have successfully completed a minimum of 40 hours of post-graduate instruction in mammography interpretation in the 24 months before the date he or she begins reading screening mammographies for Medicare beneficiaries; and

—Have successfully completed a minimum of 40 hours of post-graduate instruction in mammography interpretation every 24 months after the date that he or she begins reading screening mammographies for Medicare beneficiaries.

—Continue to read an average of 10 or more screening or diagnostic mammographies per work week after he or she begins reading screening mammographies for Medicare beneficiaries.

We are interested in receiving comments regarding the appropriateness of these training and experience requirements.

Section 494.54(c) would require that the interpreting physician prepare and sign a written report on his or her interpretation of the results (that is, the images or films) of the screening mammography procedure and that a copy of that report and the original images or films be forwarded to the patient's screening mammography supplier for inclusion in the patient's medical records. It would also require that the interpreting physician provide a written statement to the patient, in terms easily understood by a lay person. The statement would describe the importance of the screening mammography procedure to her ongoing health (including a description of the steps that should be taken if the results of the mammography procedure are positive), as well as her responsibility to share with any new physician or supplier of her next screening mammography, the date and place of her previous screening mammography. The statement must record the date of the procedure, the name of the facility providing the procedure, the physician (if any) to whom the woman wants a copy to be sent, and must indicate that the original images or films have been provided to the screening mammography supplier for inclusion in the woman's permanent medical record. This proposed requirement was also included as a result of our meetings with representatives of the FDA and the ACR.

We would add a new § 494.56 to set forth requirements concerning qualifications and orientation of technical personnel and the retention of employee records. Paragraphs (a) and (b) of this section were modeled after similar requirements at § 405.1413 concerning the conditions for coverage of portable X-ray services. Paragraph (a) would require that all operators of screening mammography equipment be licensed by the State to perform radiological procedures or, in States that have no licensing requirements, be certified in radiography by the American Registry of Radiologic Technologists, the American Registry of Clinical Radiographic Technologists, or possess equivalent certification qualifications.

In addition, on the basis of consultation with the FDA and ACR, we would require that all operators of screening mammography equipment meet certain formal and specialized training standards to ensure that a high level of quality is achieved in producing the results (that is, films or images) of the radiologic procedure. State licensure or other certificates in radiography normally mean that operators are only generally qualified to perform radiological procedures and not that they are specifically trained to perform screening mammography procedures that are especially difficult to do correctly. Accordingly, the operators would be required to successfully complete a program of not less than 24 months of formal training in X–ray technology in a school that meets the requirements of Appendix A (Standards for Accreditation of Educational Programs for Radiographers) of 42 CFR Part 75, or that is approved by the Council on Allied Health Education and Accreditation. Also, they would have to have successfully completed specialized training in mammographic positioning, compression, and technique factor settings in the 24 months prior to January 1, 1990 (or in the 24 months preceding the time he or she begins performing mammographies for Medicare beneficiaries), and every 24 months thereafter.

Paragraph (b) of proposed § 494.56 would require that a supplier of screening mammography services have an orientation program for operators based on a procedural manual that is available to all staff members and that includes instructions in all of the following areas:

- Precautions to protect the following individuals from unnecessary exposure to radiation—
  - —Patients;
  - —Individuals supporting a patient during a mammography procedure;
  - —Other individuals in the surrounding environment; and
  - —The operator of the screening mammography equipment.
- Determination of the area that will receive the primary beam (breast positioning).
- Pertinent information on compression, exposure levels, resolution, contrast, noise, examination identification, artifacts, and average glandular dose per view.
- Employee responsibilities concerning the proper use of personal radiation monitors.
- Proper use and maintenance of equipment, including a discussion of the image receptors appropriate for use with mammography and the kV(kilovoltage)-target-filter combination to be used with each image receptor.
- Proper maintenance of records.
- Possible technical problems and solutions.
- Protection against electrical hazards.
- Hazards of excessive exposure to radiation.

Paragraph (c) of § 494.56 provides alternative qualification criteria for people who furnish diagnostic X-ray physics support. The primary criteria are contained in (c)(1), which would require that those who furnish diagnostic X-ray physics support be certified by the American Board of Radiology as diagnostic medical physicists or possess qualifications that are recognized by the Secretary as equivalent to those required for certification. We are soliciting suggestions from the public for alternate sources of certification or registration for meeting this requirement. After consulting with the FDA, the ACR, and other health care organizations, we concluded that adoption of this certification requirement would be the best way to ensure that these individuals would be qualified to maintain a satisfactory quality assurance program. We were advised that the person furnishing diagnostic X-ray physics support is the technical expert with the overall responsibility of assuring that mammography equipment performance is consistently on the level required by the quality standards. He or she is a recognized expert in the physics involved in the operation of mammography equipment and the techniques used in monitoring equipment performance, and is capable of evaluating the monitoring results. Furthermore, he or she is specially qualified to carry out corrective actions as needed to ensure that the equipment continues to operate properly. Under this proposed rule, the person furnishing diagnostic X-ray physics support would establish and guide the quality assurance program. Specific duties would include conducting or training others to conduct equipment performance monitoring functions, analyzing the monitoring results to determine if there are problems requiring correction, and carrying out or arranging for the necessary corrective actions as well as the required calibrations and other preventive maintenance. Paragraph (c)(1) would also require that the person furnishing diagnostic X-ray physics support meet minimum training, experience, and continuing education requirements pertinent to screening mammography. We solicit suggestions regarding what these requirements should encompass.

Paragraph (c)(2) provides an alternate set of criteria, which has been included in recognition of the fact that in some parts of the country, especially in the rural regions, individuals meeting the qualifications set forth in (c)(1) may be unavailable to the screening mammography facility. In such cases, paragraph (c)(2) permits the State radiation control agency to recognize other individuals from the private sector as being qualified to provide guidance to the facility for the establishment and maintenance of a quality assurance program. This is a logical extension of the programs already in existence in several States in which the State program identifies "qualified experts" in

the private sector capable of performing a variety of diagnostic radiology physics tests and corrective actions. It is also in accordance with recommendations to the States contained in the "Suggested State Regulations for the Control of Radiation" (developed by the Conference of Radiation Control Program Directors) concerning the identification of those qualified to furnish diagnostic X-ray physics support. We are soliciting comments from the public on this alternative approach and suggestions for other ways of identifying individuals who are qualified to establish and maintain a satisfactory quality assurance program.

The proposed § 494.56(d) was adopted from the language used in § 405.1413(c). Section 494.56(d) would require that records be maintained for each current employee and that the records include evidence that each employee is qualified for his or her position by means of appropriate State licensure, other certification, training, and experience.

We would add a new § 494.58 to set forth a condition specifying the requirements for obtaining and preserving screening mammography records. It was modeled after § 405.1414, which specifies similar requirements for the preservation of portable X-ray records. The proposed condition states that all reasonable efforts be made to obtain any of the beneficiary's previous screening mammography records including original images or films, copies of written reports prepared by interpreting physicians, and other relevant information pertinent to previous screening mammographies that might be available from others, for comparison with the current screening mammography records. We would also require that records of previous screening mammographies obtained and current and subsequent screening mammographies produced by the supplier must be properly preserved and made available to other qualified mammography suppliers or others that submit a written request authorized by the beneficiary. The two specific standards that § 494.58 would set forth are as follows:

- The supplier must make, for each beneficiary, a record of the screening mammographies it performs, including: the date the screening mammogram was made and the date of the interpretation; the name of the beneficiary; the name of the equipment operator and the name of the interpretating physician; a description of the procedures performed; the name of the referring physician (if any), or other physician (if any) identified by the beneficiary to receive the interpreting physician's written report; and the date the physician's written report was sent to the appropriate physician or beneficiary.
- The supplier must provide satisfactory assurances (as documented in its medical records) that the images or films of the first and subsequent screening mammography procedures and the related written reports of the physicians' interpretations for each woman who is a Medicare beneficiary are either placed in her permanent medical records kept by the supplier or sent to another person (including the beneficiary) for placement in the women's permanent medical record as directed by the woman or by her physician. In the case of a participating supplier who holds the woman's medical records, the records of the mammography procedure must be retained for a period of at least 60 calendar months following the date of service (or longer if required by State law). Some concern has been expressed that these records should be retained indefinitely, but we believe that a reasonable limit must be placed on the retention of these records. Therefore, we have specified 60 calendar months, which is the longest period of time that any other participating provider or supplier is currently required to retain medical records. However, we specifically ask for comments on this issue.

Additionally, we would add a new § 494.60 to set forth the technical standards for mammography equipment. We have included in these proposed standards the requirements set forth at 21 CFR 1020.30 (FDA standards for diagnostic X-ray systems and their major components) and 21 CFR 1020.31 (FDA standards for radiographic equipment) and have also adopted suggestions from the FDA and the ACR. However, it is important to note that general purpose X-ray systems with special attachments for mammography, which are permitted under the FDA performance standards, would not meet the requirements for this standard. This is because section 1834(e)(3)(A) of the Act states that "the equipment used to perform the mammography must be specifically designed for mammography." General purpose units with special attachments for mammography are designed for a wide range of diagnostic and screening examinations and therefore do not meet the statutory requirement that they be specifically designed for mammography.

At the annual meeting of the Conference of Radiation Control Program Directors that was held in May 1986, a 1985–86 Nationwide Evaluation of X-ray Trends (NEXT) survey was discussed. This survey, which was conducted by the Conference of Radiation Control Program Directors, found that 30 percent of the xerography units were specifically designed for mammography while 82 percent of the film/screen units were so designed (Fred Rueter, NEXT 1985, (Mammography) Fall 1987, Newsletter of the Conference of Radiation Control Program Directors, Attachment No. 3). However, on the basis of analysis performed by the FDA there are about twice as many film/screen units as xerography units so overall about 70 percent of the mammography systems met the proposed requirement in 1985–86 and only about 30 percent did not. Furthermore, the percentage of systems specifically designed for mammography has been increasing rapidly; the newly purchased systems are almost entirely of that type.

The FDA fully expects that the data from the NEXT 1988 survey will show that the percentage of units that would meet this general requirement would be above 70 percent and that the use of only specifically designed units for mammography will continue to grow.

Thus, the specific standards proposed in § 494.60 follow:

- The equipment must be specifically designed for mammography and identified by the manufacturer as designed only for mammography.
- The equipment must meet the FDA performance standards for diagnostic X-ray systems and their major components at 21 CFR 1020.30 and FDA's standards for radiographic equipment at 21 CFR 1020.31. (However, the FDA standards include general requirements for any type of X-ray equipment; they do not specify requirements designed specifically for mammography equipment. In addition, the published FDA standards do not address the subject of image receptor systems, which are essential to the consistent performance of quality mammograms. Therefore, the requirements that follow must be added to explain what is meant by the statutory phase "specifically designed for mammography.")
- The image receptor systems and all their individual components must be designed appropriately for mammography.
- The equipment must be limited to providing kV(kilovoltage)-target-filter combinations appropriate to image receptors.
- The nominal focal spot size of the X-ray tube must not exceed 0.7 mm.

- Devices parallel to the imaging plane must be available to immobilize and compress the breast.
- The equipment must have the capability for using anti-scatter grids.
- The equipment must have the capability of automatic exposure control.
- The equipment must have a control panel that includes a device (usually a milliammeter) or means for an audible signal to give positive indication of the production of X-rays whenever the X-ray tube is energized. The control panel must include appropriate indicators (labeled control settings or meters that show the physical factors such as kVp (kilovoltage potential), mAs (milliampere seconds), exposure time, or whether timing is automatic) used for exposure.

In a new § 494.62, we propose to set forth a condition concerning safety standards for mammography. In proposing this condition, we adapted the provisions of § 405.1415, which set the safety standards for portable X-rays. We would require that screening mammograms be conducted with equipment that is free from unnecessary hazards for patients, personnel, and other people in the immediate environment, and in accordance with procedures that provide minimum radiation exposure. These standards would include the following:

- Using proper safety precautions, including: adequate shielding for patients, personnel, and facilities. The equipment must be operable only from a shielded position.
- Use of exposure badges or other appropriate devices to measure the radiation exposure of personnel operating the equipment.
- Periodic inspection of equipment and shielding by a staff or consultant medical physicist or by a physicist approved by an appropriate State or local government agency as meeting the qualification requirements of § 494.56(c). Identified hazards must be promptly corrected.
- Use of shockproof and grounded equipment.

Finally, we would add a new § 494.64 to set forth quality assurance standards. These standards were written after consultation with representatives from the FDA and the ACR and, for the most part, incorporate the principles described in the FDA recommendations for quality assurance programs for diagnostic radiology facilities at 21 CFR 1000.55. Specifically, § 494.64 would require a supplier of mammography services to have an ongoing equipment quality assurance program specific to mammography imagery and covering all components of the X-ray system from X-ray generator to the image developer in order to ensure consistently high quality images with minimum patient exposure. We would specify that the supplier must conduct a general review of the program at least annually and employ (or hire on a consultative basis) a medical physicist who, under the direction of the supervising physician described in § 494.52, will be responsible for establishing and conducting the program. The specific standards set forth in proposed § 494.64 that follow are given to ensure that the level of quality assurance is consistent no matter which facility the patient visits:

- The medical physicist has the overall responsibility for establishing and conducting the ongoing equipment quality assurance program. The medical physicist's specific duties must include—

—Conducting or training others to conduct equipment performance monitoring functions;

—Analyzing the monitoring results to determine if there are problems requiring correction; and

—Carrying out or arranging for necessary corrective actions as well as calibrations and other preventive maintenance.

- All variable parameters of the equipment must be calibrated—

—When it is first installed;

—After any major changes or replacement of parts;

—At least annually during use; and

—When quality assurance tests indicate that calibration is needed.

- The supplier must routinely monitor the performance of the mammography system. The need to monitor the following parameters at the given frequencies is generally accepted by radiological experts.

—At a minimum, the parameters that must be monitored are—

Processor performance (through sensitometric-densitometric means);

Half value layer;

Output reproducibility and linearity;

Automatic exposure control reproducibility, kVp response, and thickness response;

Adequacy of film storage (both before use and after exposure if processing does not occur immediately);

Darkroom integrity;

Availability and use of technique charts that must include an indication of the kV-target-filter combination to be used with each image receptor;

Image quality (using a testing device called a "phantom", which simulates the composition of the breast and indicators of disease conditions, allowing objective analysis of clinical image quality); and

Dose.

—The equipment must be monitored frequently.

Processor performance and the use of a kV-target-filter combination appropriate to the image receptor must be monitored daily before patient irradiation.

Image quality must be monitored before patient irradiation with a phantom every time the unit is moved, altered in any major way including the replacement of parts, and at least monthly between movements or alterations.

The frequency of monitoring of all other parameters must be proportional to the expected variability of each parameter, but, at a minimum, monitoring must be conducted at least annually.

- *Standard—monitor evaluation.* Monitoring must be evaluated on a regular basis.

—Standards of image quality giving acceptable ranges of values for each of the parameters tested must be established to aid in the evaluation. The standards of image quality related to dose must include a requirement that the mean glandular dose for one craniocaudal view of a 4.5 cm compressed breast (50 per cent adipose/50 per cent glandular) must not exceed 100, 300, and 400 mrad (millirad) for film/screen units without grids, film/screen units with grids, and xerography units respectively. These dose values reflect generally accepted standards of practice.

—The monitoring results must be compared routinely to the standards of image quality. If the results fall outside the acceptable range, the test must be repeated. If the results continue to be unacceptable, the source of the problem must be identified and corrected before further examinations are conducted.

- A program to analyze retakes must be established as a further aid in detecting and correcting problems affecting image quality or exposure.
- Responsibility for each standard, from monitoring through the annual review, must be assigned to qualified personnel. These assignments must be documented in the supplier's record.

III. Regulatory Impact Analysis

A. Executive Order 12291 and Regulatory Flexibility Act

Executive Order 12291 (E.O. 12291) requires us to prepare and publish a regulatory impact analysis for any proposed rule that meets one of the E.O. criteria for a "major rule"; that is, that would be likely to result in—

- An annual effect on the economy of $100 million or more;
- A major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions; or
- Significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

We generally prepare a regulatory flexibility analysis that is consistent with the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 through 612) unless the Secretary certifies that a proposed rule would not have a significant economic impact on a substantial number of small entities. For purposes of the RFA, all physicians and suppliers of screening mammography services and equipment are treated as small entities.

This proposed rule would implement section 204 of Public Law 100–360 to provide Medicare coverage of screening mammography. We anticipate that Medicare coverage of screening mammography would result in the following costs:

TABLE I.—PROJECTED COSTS AS A RESULT OF MEDICARE COVERAGE OF SCREENING MAMMOGRAPHY

[In millions] [1]

Fiscal year—				
1990	FY 1991	FY 1992	FY 1993	FY 1994
$150	$275	$325	$375	$425

[1] Rounded to the nearest 25 million.

Our projected costs are based on the following assumptions:

- An effective date of January 1, 1990.
- A 50-percent utilization rate across all age groups in calendar year 1990 rising five percent annually to reach 75 percent in calendar year 1995.

Below are estimates of the number of incurred screening mammographies.

TABLE II.—PROJECTED NUMBER OF INCURRED SCREENING MAMMOGRAPHIES AS A RESULT OF MEDICARE COVERAGE OF SCREENING MAMMOGRAPHIES

[In millions]

	Calendar year—				
	1990	1991	1992	1993	1994
Total	4.9	5.5	6.1	6.7	7.4

We estimate that in FY 1990 there would be 7,000 screening mammography facilities increasing to 9,000 in FY 1991. The total cost of surveying and certifying these 9,000 facilities would be approximately $3.5 million.

We believe that any effects of these provisions on the economy and public would primarily be the result of the statute and not this proposed rule. This is because we have proposed to implement the statute exercising administrative discretion in only the following four areas: the equipment standards for screening mammography; the safety standards for screening mammography; specifying who we consider to be a high risk individual for the purpose of determining the frequency of screening mammography for an asymptomatic woman over 39 years of age, but under 50; and the Board certification we would accept. In section II of this preamble, we discuss our rationale for choosing specific provisions. As discussed in the analyses below, with one exception, we do not believe these provisions would result in effects that meet E.O. 12291 or Regulatory Flexibility Act criteria. That exception is the proposed equipment standards for screening mammography of Medicare beneficiaries. The equipment must be specifically designed for mammography and identified by the manufacturer as designed only for mammography. We are not able to determine the costs associated with this exception. For that reason, and because Medicare coverage of screening mammography represents a significant expansion of Medicare benefits, we are providing voluntary regulatory impact and regulatory flexibility analyses.

1. Background

Congressional hearings held in 1986 projected that in 1987 approximately 110,000 women would be diagnosed as having new primary cases of breast cancer, and approximately 47,000 deaths from breast cancer would occur (Medicare Coverage for Mammography Examinations: Hearings Before the Subcommittee on Health of the House Committee on Ways and Means, 100th Cong., 1st Sess. 6 (1987)). Furthermore, it was estimated that one out of every ten women would develop the disease in her lifetime (ibid. note 1, at 66).

Additionally, the Subcommittee report stated that women 65 and older are about one and one-half times as likely as women in the 40–64 age group to develop breast cancer. It was projected that in 1987 about 48,000 (44 percent) of the new primary cases and about 24,000 of breast cancer deaths would occur in women over age 65 ("The Feasibility of Breast Cancer Screening," Health Technology, 1:26–37, 1987).

Some medical experts believe that appropriate use of screening mammography, in conjunction with clinical examination and breast self examination, can enable health care suppliers to detect many breast cancers at their earliest stage (op. cit. note 1, at 66).

2. Effects on Physicians and Other Healthcare Suppliers

We believe that a great number of the supervising physicians and most of the interpreting physicians who perform screening mammographies are radiologists. As of December 31, 1986, there were 8,345 radiologists practicing in the United States with 6,365 being certified by their corresponding board (Physician Characteristics and Distribution in the U.S., 1986. Department of Data Release Services, Division of Survey and Data Resources, American Medical Association, 1987). Radiologists, as a group, had a physician participation rate of 40 percent in 1987 and a Medicare assignment rate of 73 percent in 1986.

We believe that Medicare coverage of screening mammography would result in increased utilization over current levels on the part of Medicare eligible women. A logical outgrowth of this increased utilization would be an increase in demand for those who provide the services and supplies that constitute the screening mammography field, namely: supervising physicians, interpreting physicians, medical physicists, radiological technologists, and suppliers of screening mammography services and equipment.

The effect of this proposed rule on an individual radiologist, physician, or other health care supplier would depend on the percentage of their business that involves Medicare eligible women and the percentage of their business that involves performing screening mammographies. Clearly, this would vary among practicing radiologists, physicians, and other healthcare suppliers. Additionally, we believe that suppliers of screening mammography equipment would experience increased demand for their equipment.

The upper limit for a screening mammography service performed in 1990 would be $50. In subsequent years, the upper limit would be increased by the percentage increase in the Medicare Economic Index (MEI) for that subsequent year.

Nonparticipating physicians would be affected by this proposed rule. Section 1834(e)(5)(B) of the Act, with respect to screening mammography performed by a nonparticipating physician, places an upper limit on the amount that a nonparticipating physician or supplier can charge beneficiaries. In 1990, the first year of implementation, the upper charge limit would be 125 percent of the payment limit, which would be $62.50. In 1991, the upper charge limit would be 120 percent of the payment limit, and in subsequent years, the upper charge limit would be 115 percent of the payment limit.

Below is a discussion of several areas in which we are using administrative discretion with respect to physicians and other health care suppliers and a discussion of why we believe, with the exception of the proposed equipment standards, their effects on these entities would be negligible.

First, in developing the equipment standards for screening mammography, we have incorporated FDA requirements and have also adopted suggestions from the FDA and ACR. Although in certain respects the proposed equipment standards go beyond what is currently required by the FDA for diagnostic X-ray systems and radiographic equipment, we believe that the majority of physicians and healthcare suppliers would be able to meet them. This belief is based on the 1985–86 NEXT survey discussed in section II.B. of the preamble. This survey, conducted by the Conference of Radiation Control Program Directors, found that approximately 70 percent of currently existing mammography systems would meet the equipment standards we are proposing and about 30 percent would not.

Those physicians that possess mammography systems that would not meet the proposed equipment standards would incur additional expenses if they choose to meet these standards. One major factor in their decision as to whether to purchase this equipment might be the percentage of their patient population that are Medicare beneficiaries. We are unable to determine this percentage or the percentage of physicians who currently do not meet these proposed standards and would choose to comply with them. Thus, we cannot estimate the cost of compliance.

Second, in developing safety standards for screening mammography, we adapted the safety standards currently in use for portable X-ray equipment. Thus, for the most part the equipment and safety standards we are proposing are drawn from currently used standards and, therefore, would place little if any additional burden on most healthcare suppliers.

Third, the statute allows the Secretary to specify in regulations the appropriate organization to certify that an individual is qualified to perform radiological procedures and the appropriate board to certify that an individual is qualified to interpret radiological procedures, or be board eligible, or meet equivalent qualifications. We are proposing the use of two board certifying organizations—the American Board of Radiology and the American Osteopathic Board of Radiology. Use of these particular board certifying organizations poses no additional burden on radiologists since those organizations' board certification requirements are no more restrictive than current Medicare requirements that radiologists must meet in order to perform radiological services other than screening mammographies for Medicare beneficiaries.

Furthermore, as stated in section II.B. of the preamble, in consultation with the FDA, ACR, and NCI, we would require in § 494.54(b) that the interpreting physician meet several experience and continuing education standards specifically related to mammogram reading and interpretation. We believe that it is necessary to have these standards in order to implement the intent of Congress with regard to the safety and accuracy of screening mammography for Medicare beneficiaries.

We believe it is reasonable to expect physicians who perform screening mammographies for Medicare beneficiaries to have the experience and training in this area required by these proposed standards. Moreover, we do not believe that these proposed standards are onerous.

Lastly, at a new § 494.52, we would establish a condition requiring supervision of screening mammography by a qualified physician. As stated in section II.B. of the preamble, the physician supervisor must be a licensed doctor of medicine or licensed doctor of osteopathy who meets the requirements for the interpretation of screening mammograms as specified in § 494.54. The language we would use is similar to that used in 42 CFR 405.1412(a) which sets forth a supervising physician standard for coverage for portable X-ray services and 42 CFR 405.1412(b) which sets forth the required qualifications of the supervising physician. Because the supervising physician coverage standards we are proposing are drawn from currently used standards, we believe they would place little if any additional burden on most supervising physicians.

3. Effect on Beneficiaries

We believe that the effect of this proposed rule on beneficiaries would be a positive one. After meeting the $75 part B deductible, the only expense a beneficiary would incur for a covered screening mammography would be the 20 percent coinsurance if the physician performing the service is a participating physician. For calendar year 1990, this would be no more than $10 (20 percent coinsurance × $50 limit). (If a nonparticipating physician is used, the physician is limited in what he or she can charge.)

There is an area in which we are using administrative discretion with respect to beneficiaries. The statute allows us to specify who we consider to be a high risk individual for the purpose of determining the frequency of screening mammography for an asymptomatic woman over 39 years of age, but under 50. The guidelines we proposed are ones we received from the National Cancer Institute of the National Institutes of Health. We believe they are broad enough to capture those asymptomatic women who have a demonstrable need for a screening mammography.

B. Rural Hospital Impact Statement

Section 1102(b) of the Act requires the Secretary to prepare a regulatory impact analysis if a proposed rule may have a significant impact on the operations of a substantial number of small rural hospitals. Such an analysis must conform to the provisions of section 603 of the RFA. For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital with fewer than 50 beds located outside of a Metropolitan Statistical Area.

We are not preparing a rural impact statement since we have determined, and the Secretary certifies, that this proposed rule would not have a significant economic impact on the operations of a substantial number of small rural hospitals.

IV. Information Collection Requirements

Proposed regulations at §§ 494.52, 494.54, 494.56, 494.58, and 494.64 contain

information collection and recordkeeping requirements that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1980 (44 U.S.C 3501 *et seq.*). The information collection requirements concern written reports on examination results, interpretations, and employee records. The respondents who would provide the information are suppliers of mammography services. Public reporting burden for this collection of information is estimated to be [estimate to be provided before final publication] minutes/hours per response. A notice will be published in the Federal Register after approval is obtained. Organizations and individuals desiring to submit comments on the information collection and recordkeeping requirements should direct them to the OMB official whose name appears in the "ADDRESS" section of this preamble.

V. Response to Comments

Because of the large number of items of correspondence we normally receive on a proposed rule, we are not able to acknowledge or respond to them individually. However, we will consider all comments that we receive by the date and time specified in the "DATE" section of this preamble, and, if we proceed with a final rule, we will respond to the comments in the preamble of that rule.

List of Subjects

42 CFR Part 405

Administrative practice and procedure, Health facilities, Health professions, Kidney diseases, Laboratories, Medicare, Nursing homes, Reporting and recordkeeping requirements, Rural areas, X-rays.

42 CFR Part 410

Health facilities, Health professions, Kidney diseases, Laboratories, Medicare, Rural areas, X-rays.

42 CFR Part 413

Health facilities, Kidney diseases, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 494

Mammography, X-rays, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, 42 CFR chapter IV would be amended as follows:

PART 405—FEDERAL HEALTH INSURANCE FOR THE AGED AND DISABLED

A. Part 405, subpart C is amended as set forth below:

Subpart C—Exclusions, Recovery of Overpayment, Liability of a Certifying Officer, and Suspension of Payment

1. The authority citation for subpart C is amended to read as follows:

Authority: Secs. 1102, 1815, 1833, 1834, 1842, 1861, 1862, 1866, 1870, 1871 and 1879 of the Social Security Act (42 U.S.C. 1302, 1395g, 1395l, 1395m, 1395n, 1395x, 1395y, 1395cc, 1395gg, 1395hh, and 1395pp) and 31 U.S.C. 3711.

2. In Section 405.310 the introductory text of the section and the introductory text of paragraph (a) are reprinted and (a)(1) is revised to read as follows:

§ 405.310 Particular services excluded from coverage.

The following services are excluded from coverage.

(a) *Routine physical checkups such as*—

(1) Examinations performed for a purpose other than treatment or diagnosis of a specific illness, symptom, complaint, or injury, except for screening mammography (including a physician's interpretation of the results) that meets the payment requirements specified at § 410.34 of this chapter and the conditions for coverage at subpart B, part 494 of this chapter.

* * * * *

B. Part 405, subpart E is amended as set forth below:

Subpart E—Criteria for Determination of Reasonable Charges; Radiology Fee Schedules; and Reimbursement for Services of Hospital Interns, Residents, and Supervising Physicians

1. The authority citation for subpart E continues to read as follows:

Authority: Secs. 1102, 1814(b), 1832, 1833(a), 1834 (b) and (e), 1842 (b) and (h), 1861 (b) and (v), 1862(a)(14), 1866(a), 1871, 1881, 1886, 1887, and 1889 of the Social Security Act as amended (42 U.S.C. 1302, 1395f(b), 1395k, 1395l(a), 1395m (b) and (e), 1395u (b) and (h), 1395x (b) and (v), 1395y(a)(14), 1395cc(a), 1395hh, 1395rr, 1395ww, 1395xx, and 1395zz).

2. A new § 405.534 is added to read as follows:

§ 405.534 Limitation on payment for screening mammography services.

This section implements section 1834(e) of the Act by establishing a limit on payment for screening mammography examinations. There are three categories of billing for screening mammography services. Those categories and the payment limitations on each follow:

(a) *Global or complete service billing representing both the professional and technical components of the procedure.* When a global service fee is billed, the amount of payment subject to the deductible is equal to 80 percent of the least of the—

(1) Actual charge for the service;

(2) Amount determined with respect to the professional and technical components for the service under §§ 405.530 through 405.533; or

(3) Limit for the procedure. For services furnished in calendar year 1990, the limit is $50. On January 1 of each subsequent year, the limit will be updated by the percentage increase in the Medicare Economic Index (MEI).

(b) *Professional component billing representing only the physician's interpretation for the procedure.* When the professional component of screening mammography services is billed separately, the amount of payment for that professional component subject to the deductible is equal to 80 percent of the least of the—

(1) Actual charge for the professional component of the service;

(2) Amount determined with respect to the professional component for the service under §§ 405.530 through 405.533, which set forth the methodology for computing payments for radiologist services; or

(3) Professional portion of the screening mammography limit. This amount is determined by multiplying the screening mammography limit described in paragraph (a)(3) of this section by 37 percent.

(c) *Technical component billing representing other resources involved in furnishing the procedure.* When the technical component of screening mammography services is billed separately, the amount of payment subject to the deductible is equal to 80 percent of the least of the—

(1) Actual charge for the technical component of the service;

(2) Amount determined with respect to the technical component for the service under §§ 405.530 through 405.533; or

(3) Technical portion of the screening mammography limit. This amount is determined by multiplying the screening mammography limit described in paragraph (a)(3) of this section by 63 percent.

3. A new § 405.535 is added to read as follows:

BEST COPY AVAILABLE

§ 405.535 Special rules for nonparticipating physicians furnishing screening mammography services.

If screening mammography services are furnished to a beneficiary by a nonparticipating physician or supplier who does not accept assignment, a special limiting charge applies to the charges made to the beneficiary. The limiting charge is the lesser of—

(a) The amount determined using § 405.533 (special rules for nonparticipating physicians furnishing radiology services); or

(b) A percentage of the payment limit for screening mammograms as follows:

(1) 125 percent of the payment limit in 1990;

(2) 120 percent of the payment limit in 1991; and

(3) 115 percent of the payment limit beginning January 1, 1992.

PART 410—SUPPLEMENTARY MEDICAL INSURANCE (SMI) BENEFITS

C. Part 410, Subpart B is amended as set forth below:

1. The authority citation for part 410 is revised to read as follows:

Authority: Secs. 1102, 1832, 1833, 1834, 1835, 1861, (r), (s) and (cc), 1871, and 1881 of the Social Security Act (42 U.S.C. 1302, 1395k, 1395l, 1395m, 1395n, 1395x, (r), (s) and (cc), 1395hh, and 1395rr).

2. Section 410.1 is amended by revising paragraph (a) to read as follows:

§ 410.1 Basis and scope.

(a) *Statutory basis.* Section 1832 of the Social Security Act establishes the scope of benefits provided under the Medicare Part B supplementary medical insurance (SMI) program. Sections 1833, 1834, 1835, and 1862 set forth the amounts of payment for SMI services, the conditions for payment, and the exclusions from coverage. Section 1861 defines the kinds of services that may be covered.

* * * * * * *

Subpart B—Medical and Other Health Services

3. In § 410.10, the introductory text is reprinted and paragraph (t) is added to read as follows:

§ 410.10 Medical and other health services: Included services.

Subject to the conditions and limitations specified in § 410.12, "medical and other health services" includes the following services:

* * * * *

(t) Screening mammography services.

§ 410.35 [Redesignated from § 410.34]

4. The current § 410.34 is redesignated as § 410.35, and a new § 410.34 is added to read as follows:

§ 410.34 Conditions for coverage for and limitations on coverage for screening mammography services.

Effective January 1, 1990, Medicare pays for screening mammography services (including physician interpretation of the results). Screening mammography is defined as a radiologic procedure furnished to a woman for the purpose of early detection of breast cancer and includes a physician's interpretation of the results of the procedure.

(a) Coverage is available for screening mammography services only if furnished by a screening mammography supplier that meets all the conditions for coverage of screening mammography specified in subpart B of part 494 of this chapter.

(b) The following limitations apply to coverage of screening mammography services:

(1) The service must be a four-view exposure (that is, a cranio-caudal and a medial lateral oblique view of each breast) furnished by a supplier that meets the conditions for coverage of screening mammography services specified in subpart B of part 494 of this chapter.

(2) Payment may not be made for screening mammography performed on an asymptomatic woman under 35 years of age.

(3) Payment may be made for only 1 screening mammography performed on an asymptomatic woman over 34 years of age, but under age 40.

(4) For an asymptomatic woman over 39 years of age, but under age 50, the following restrictions apply:

(i) Payment may be made for a screening mammography performed after at least 11 months have passed since the last screening mammography if the woman has—

(A) A personal history of breast cancer;

(B) A personal history of biopsy-proven benign breast disease;

(C) A mother, sister, or daughter who has had breast cancer; or

(D) Not given birth prior to age 30.

(ii) If the woman does not meet the conditions described in paragraph (b)(4)(i) of this section, payment may be made for a screening mammography performed after at least 23 months have passed since the last screening mammography.

(5) For an asymptomatic woman over 49 years of age, but under age 65, payment may be made for a screening mammography performed after at least 11 months have passed since the last screening mammography.

(6) For an asymptomatic woman over 64 years of age, payment may be made for a screening mammography performed after at least 23 months since the last screening mammography.

PART 413—PRINCIPLES OF REASONABLE COST REIMBURSEMENT; PAYMENT FOR END-STAGE RENAL DISEASE SERVICES

D. Part 413, subpart F is amended as set forth below:

1. The authority citation for Part 413 is revised to read as follows:

Authority: Secs. 1102, 1122, 1814(b), 1815, 1833(a), 1834(e), 1861(v), 1871, 1881, and 1886 of the Social Security Act as amended (42 U.S.C. 1302, 1320a–1, 1395f(b), 1395g, 1395l(a), 1395m(e), 1395x(v), 1395hh, 1395rr, and 1395ww).

Subpart F—Specific Categories of Costs

2. A new § 413.123 is added to read as follows:

§ 413.123 Payment for screening mammography performed by hospitals on an outpatient basis.

(a) *Basis and scope.* This section implements section 1834(e)(1)(C) of the Act and establishes the method for determining Medicare payment for screening mammographies performed by hospitals.

(b) *Payment to hospitals on an outpatient basis.* Payment to hospitals for screening mammography services performed on an outpatient basis (described in § 410.33 of this chapter) is determined in accordance with § 405.534(c) of this chapter.

E. A new part 494 is added to read as follows:

PART 494—CONDITIONS FOR COVERAGE OF PARTICULAR SERVICES

Subpart A—General Provisions [Reserved]

Subpart B—Conditions for Coverage of Screening Mammography

Sec.
494.50 Condition for coverage: General.
494.51 Conditions for coverage: Compliance with Federal, State, and local laws and regulations.
494.52 Condition for coverage: Supervision by a qualified physician.
494.54 Condition for coverage: Interpretation of the results of screening mammography procedures.
494.56 Condition for coverage: Qualifications and orientation of technical personnel, and retention of employee records.

Sec.
494.58 Condition for coverage: Obtaining and preserving records.
494.60 Condition for coverage: Equipment standards.
494.62 Condition for coverage: Safety standards.
494.64 Condition for coverage: Quality assurance.

Authority: Secs. 1833(a)(2)(E), 1834, 1861, 1862(a), 1863, 1864(a), 1865(a), 1902(a)(9)(C), and 1915(a)(1)(B)(ii)(I) of the Social Security Act (42 U.S.C. 1395l(a)(2)(E), 1395m, 1395x, 1395y(a), 1395z, 1395aa(a), 1395bb(a), 1396a(a)(9)(C), and 1396n(a)(1)(B)(ii)(I)).

Subpart A—General Provisions [Reserved]

Subpart B—Conditions for Coverage of Screening Mammography

§ 494.50 Condition for coverage: General.

To be approved for participation in the Medicare program a supplier of screening mammography services must meet all the conditions set forth in this subpart with respect to individuals entitled to Medicare part B.

§ 494.51 Conditions for coverage: Compliance with Federal, State, and local laws and regulations.

The supplier of screening mammography services must comply with all applicable Federal, State, and local laws and regulations pertaining to radiological services and screening mammography services. This includes—

(a) Licensure or registration of supplier;

(b) Licensure or registration of personnel;

(c) Licensure or registration of equipment;

(d) Compliance with safety laws.

§ 494.52 Condition for coverage: Supervision by a qualified physician.

(a) *Standard: Qualifications of the physician supervisor.* Screening mammography services must be furnished under the supervision of a licensed doctor of medicine or licensed doctor of osteopathy who meets the requirements for the interpretation of the results of the screening mammography procedure as specified in § 494.54.

(b) *Standard: Physician supervision.* The provision of all screening mammography services must be supervised by a physician who must document in writing annually that—

(1) He or she has checked the procedural manuals and has observed monthly the operators' performance;

(2) He or she has verified that equipment and personnel meet applicable Federal, State, and local licensure and registration requirements;

(3) Safe operating procedures are used; and

(4) All the other requirements of this subpart are being met.

§ 494.54 Condition for coverage: Interpretation of the results of screening mammography procedures.

The results of all screening mammography procedures must be interpreted by a physician who meets the following certification, experience, continuing education, and written report requirements:

(a) *Standard: Board certification.* The interpreting physician must—

(1) Be certified by the American Board of Radiology or by the American Osteopathic Board of Radiology; or

(2) Possess equivalent certification qualifications.

(b) *Standard: Experience and continuing education.* (1) For physicians first meeting the board certification requirements or meeting other equivalent certification requirements described in paragraph (a) of this section before January 1, 1990, the physician must also—

(i) Have been reading the results of an average of 10 or more screening or diagnostic mammographies per work week in the 6 months preceding January 1, 1990.

(ii) Have successfully completed a minimum of 40 hours of post-graduate instruction in mammography interpretation in the 24 months preceding January 1, 1990;

(iii) Have successfully completed a minimum of 40 hours of post-graduate work in mammography interpretation every 24 months after January 1, 1990; and

(iv) Continue to read the results of an average of 10 or more screening or diagnostic mammographies per work week after he or she begins to read screening mammographies for Medicare beneficiaries.

(2) For physicians first meeting the board certification requirement or meeting other equivalent certification qualifications described in paragraph (a) of this section on or after January 1, 1990, the physician must also—

(i) Have been reading the results of an average of 10 or more screening or diagnostic mammographies per work week in the 6 months preceding when he or she begins reading screening mammographies for Medicare beneficiaries;

(ii) Have successfully completed a minimum of 40 hours of post-graduate instruction in mammography interpretation in the 24 months preceding when he or she begins readings screening mammographies for Medicare beneficiaries.

(iii) Have successfully completed a minimum of 40 hours of post-graduate work in mammography interpretation every 24 months after the date he or she begins reading screening mammographies for Medicare beneficiaries; and

(iv) Continue to read the results of an average of 10 or more screening or diagnostic mammographies per work week after he or she begins to read screening mammographies for Medicare beneficiaries.

(c) *Standard: Written and signed report.* The interpreting physician must—

(1) Prepare and sign a written report on his or her interpretation of the results (that is, images or films) of the screening mammography procedure;

(2) Provide a copy of the written report and the original images or films to the patient's screening mammography supplier for inclusion in the patient's permanent medical record; and

(3) Provide a written statement to the patient, in terms easily understood by a lay person. The statement must describe the importance of the screening mammography to her ongoing health (including a description of the steps that should be taken if the results of the mammography procedure are positive), as well as her responsibility to share with any new physician or supplier of her next screening mammography procedure, the date and place of her previous screening mammography procedure. The statement must record the date of the procedure, the name of the facility providing the procedure, the physician (if any) to whom the woman wants a copy to be sent, and must indicate that the original images or films have been provided to the screening mammography supplier for inclusion in the woman's permanent medical record.

§ 494.56 Condition for coverage: Qualifications and orientation of technical personnel, and retention of employee records.

(a) *Standard: Qualifications of operators of screening mammography equipment.* Anyone operating screening mammography equipment must—

(1) Be licensed by the State to perform radiological procedures, or, in States that have no licensure requirements, be certified in radiography by the American Registry of Radiologic Technologists, the American Registry of Clinical Radiographic Technologists, or possess equivalent certification qualifications;

(2) Have successfully completed a program of formal training in radiologic

technology of not less than 24 months' duration in a school that meets the requirements of appendix A (Standards for Accreditation of Educational Programs for Radiographers) of 42 CFR part 75, or that is approved by the Council on Allied Health Education and Accreditation; and

(3) Have completed specialized training in mammographic positioning, compression, and technique factor settings in the 24 months preceding January 1, 1990 (or in the 24 months preceding the time he or she begins performing screening mammographies for Medicare beneficiaries), and complete this specialized training every 24 months thereafter.

(b) *Standard: Personnel orientation.* The supplier of screening mammography services must have an orientation program for operators of mammography equipment based on a procedures manual that is available to all members of the staff and that incorporates relevant documents, and instructions concerning the following:

(1) Precautions to protect the operator of the equipment, the patient and individuals in the surrounding area from unnecessary exposure to radiation.

(2) Determination of the area that will receive the primary beam (breast positioning).

(3) Pertinent information on compression, exposure levels, resolution, contrast, noise, examination identification, artifacts, and average glandular dose per view.

(4) Employee responsibilities concerning the proper use of personal radiation monitors.

(5) Proper use and maintenance of equipment, including a discussion of the image receptors appropriate for use with mammography and the kV-target-filter combination to be used with each image receptor.

(6) Proper maintenance of records.

(7) Possible technical problems and solutions.

(8) Protection against electrical hazards.

(9) Hazards of excessive exposure to radiation.

(c) *Standard: Qualifications of individuals furnishing diagnostic x-ray physics support.* Individuals furnishing diagnostic x-ray physics support must meet one of the following qualifications.

(1) The individual must be certified by the American Board of Radiology as a diagnostic medical physicist or possess equivalent qualifications. Additionally, the individual must meet minimum training, experience, and continuing education requirements pertinent to screening mammography.

(2) The individual must be recognized by a State radiation control agency as qualified to provide oversight of the establishment and conduct of the quality assurance program in § 494.64, which sets forth the standards of a quality assurance program for screening mammography required as a condition of coverage.

(d) *Standard: Employee records.* Records are maintained to show that each employee is qualified for his or her position by means of appropriate State licensure, other certification, training, and experience.

§ 494.58 Condition for coverage: Obtaining and preserving records.

All reasonable efforts must be made by the supplier of the current examination to obtain any of the beneficiary's previous screening mammography records, including original images and films, copies of written reports prepared by interpreting physicians, and other relevant information pertinent to previous screening mammographies that might be available from others, for comparison with the current screening mammography records. Records of previous screening mammographies obtained and of current and subsequent screening mammographies performed by the supplier must be properly preserved and made available to other qualified mammography suppliers or others that submit a written request authorized by the beneficiary.

(a) *Standard: Records of screening mammography services performed by the supplier.* The supplier must make, for each beneficiary, a record of the screening mammography services it provides, including—

(1) The date the screening mammography procedure was performed and the date of the interpretation;

(2) The name of the beneficiary;

(3) The name of the operator of the equipment and the name of the interpreting physician;

(4) A description of the procedures performed;

(5) The name of the referring physician (if any), or other physician (if any) identified by the beneficiary to receive the interpreting physician's written report; and

(6) The date the physician's written report was sent to the appropriate physician or beneficiary.

(b) *Standard: Preservation of records.* The supplier must provide satisfactory assurances (as documented in its medical records) that the images or films of the first and subsequent screening mammography procedures and the related written reports of the physicians' interpretations for each beneficiary are either placed in her permanent medical record kept by the supplier, or sent to another person (including the beneficiary) for placement in the beneficiary's permanent medical record as directed by her or by her physician. If the records of the examination must be retained by the supplier, they must be retained for a period of at least 60 calendar months following the date of service (or longer if required by State law).

§ 494.60 Condition for coverage: Equipment standards.

The equipment used to perform mammography must be specifically designed for mammography and must meet the following standards:

(a) *Standards: Equipment design.* The equipment must be specifically designed for mammography and identified by the manufacturer as designed only for mammography.

(b) *Standard: FDA standards.* The equipment must meet the FDA performance standards for diagnostic X-ray systems and their major components at 21 CFR 1020.30 and FDA's standards for radiographic equipment at 21 CFR 1020.31.

(c) *Standard: Image receptor systems.* The image receptor systems and all their individual components must be designed appropriately for mammography.

(d) *Standard: kV-target-filter combinations.* The equipment must be limited to providing kV-target-filter combinations appropriate to image receptors meeting the requirements of paragraph (c) of this section.

(e) *Standard: Focal spot size.* The nominal focal spot size of the X-ray tube must not exceed 0.7 mm.

(f) *Standard: Devices to immobilize and compress the breast.* Devices parallel to the imaging plane must be available to immobilize and compress the breast.

(g) *Standard: Anti-scatter grids.* The equipment must have the capability for using anti-scatter grids.

(h) *Standard: Automatic exposure control.* The equipment must have the capability of automatic exposure control.

(i) *Standard: Control panel indicators.* The equipment must have a control panel that includes a device (usually a milliammeter) or means for an audible signal to give positive indication of the production of X-rays whenever the X-ray tube is energized. The control panel must include appropriate indicators (labeled control settings of meters that show the physical factors such as

kilovoltage potential (kVp), milliampere seconds (mAs), exposure time, or whether timing is automatic) used for exposure.

§ 494.62 Condition for coverage: Safety standards.

Screening mammograms must be conducted using equipment and operating procedures free of unnecessary hazards and providing minimum radiation exposure to patients, personnel, and other persons in the immediate environment.

(a) *Standard: Safety precautions.* Proper safety precautions must be maintained. This includes adequate shielding for patients, personnel, and facilities. The equipment must be operable only from a shielded position.

(b) *Standard: Exposure badges.* Personnel operating the equipment must wear badges or other appropriate devices to measure their radiation exposure.

(c) *Standard: Equipment inspection.* Periodic inspection of equipment and shielding must be made by a staff or consultant medical physicist or by a physicist approved by an appropriate State or local government agency as meeting the qualification requirements of § 494.56(c). Identified hazards must be promptly corrected.

(d) *Standard: Protection against electrical hazards.* All equipment must be shockproof and grounded.

§ 494.64 Condition for coverage: Quality assurance.

The supplier must have an ongoing equipment quality assurance program specific to mammography imagery, and covering all components of the X-ray system, from the X-ray generator to the image developer, to ensure consistently high-quality images with minimum patient exposure. The supplier must conduct a general review of the program at least annually, and have available the services of a person qualified to furnish diagnostic X-ray physics support who, under the direction of the supervising physician described in § 494.52, is responsible for establishing and conducting the program.

(a) *Standard: Responsibility for the quality assurance program.* Under the direction of the supervising physician, the person furnishing diagnostic X-ray physics support has the overall responsibility for establishing and conducting the ongoing equipment quality assurance program. That individual's specific duties must include—

(1) Conducting or training others to conduct equipment performance monitoring functions;

(2) Analyzing the monitoring results to determine if there are any problems requiring correction; and

(3) Carrying out or arranging for the necessary corrective actions as well as for the calibrations and other preventive maintenance.

(b) *Standard: Calibration of equipment.* All variable parameters of the equipment must be calibrated—

(1) When the equipment is first installed;

(2) After any major changes or replacement of parts;

(3) At least annually during use; and

(4) When quality assurance tests indicate that calibration is needed.

(c) *Standard: Performance monitoring.* The supplier must routinely monitor the performance of the mammography system.

(1) At a minimum, the parameters that must be monitored are—

(i) Processor performance (through sensitometric-densitometric means);

(ii) Half value layer;

(iii) Output reproducibility and linearity;

(iv) Automatic exposure control reproducibility, kVp response, and thickness response;

(v) Adequacy of film storage (both before use and after exposure if processing does not occur immediately;

(vi) Availability and use of technique charts that must include an indication of the kV-target-filter combination to be used with each image receptor;

(vii) Darkroom integrity;

(viii) Image quality (using a testing device called a "phantom", which simulates the composition of the breast and indicators of disease conditions, allowing objective analysis of clinical image quality); and

(ix) Dose.

(2) The equipment must be monitored as follows:

(i) Processor performance and the use of a kV-target-filter combination appropriate to the image receptor must be monitored daily before patient irradiation.

(ii) Image quality must be monitored with a phantom every time the unit is moved, altered in any major way including the replacement of parts, and at least monthly between movements or alterations.

(iii) The frequency of monitoring all other parameters must be proportional to the expected variability of each parameter, but monitoring must be conducted at least annually.

(d) *Standard: Evaluation of monitoring results.* Monitoring must be evaluated on a regular basis.

(1) Standards of image quality giving acceptable ranges of values for each of the parameters tested must be established to aid in the evaluation. The standards of image quality related to dose must include a requirement that the mean glandular dose for one craniocaudal view of a 4.5 cm compressed breast (50 percent adipose/50 percent glandular) must not exceed 100, 300, and 400 mrad (millirad) for film/screen units without grids, film/screen units with grids, and xerography units, respectively.

(2) The monitoring results must be compared routinely to the standards of image quality. If the results fall outside the acceptable range, the test must be repeated. If the results continue to be unacceptable, the source of the problem must be identified and corrected before further examinations are conducted.

(e) *Standard: Retake analysis program.* A program to analyze retakes must be established as a further aid in detecting and correcting problems affecting image quality or exposure.

(f) *Standard: Responsible personnel.* Responsibility for each standard, from monitoring through the annual review, must be assigned to qualified personnel. These assignments must be documented in the supplier's records.

(Catalog of Federal Domestic Assistance Program No. 13.774, Medicare—Supplementary Medical Insurance.)

Dated: June 30, 1989.

Approved: August 18, 1989.

FEDERAL REGISTER PAGES AND DATES, SEPTEMBER

36275-36750	1

CFR PARTS AFFECTED DURING SEPTEMBER

At the end of each month, the Office of the Federal Register publishes separately a List of CFR Sections Affected (LSA), which lists parts and sections affected by documents published since the revision date of each title.

LIST OF PUBLIC LAWS

Note: No public bills which have become law were received by the Office of the Federal Register for inclusion in today's **List of Public Laws.**

Last List August 22, 1989

TABLE OF EFFECTIVE DATES AND TIME PERIODS—SEPTEMBER 1989

This table is used by the Office of the Federal Register to compute certain dates, such as effective dates and comment deadlines, which appear in agency documents. In computing these dates, the day after publication is counted as the first day.

When a date falls on a weekend or holiday, the next Federal business day is used. (See 1 CFR 18.17)

A new table will be published in the first issue of each month.

DATE OF FR PUBLICATION	15 DAYS AFTER PUBLICATION	30 DAYS AFTER PUBLICATION	45 DAYS AFTER PUBLICATION	60 DAYS AFTER PUBLICATION	90 DAYS AFTER PUBLICATION
September 1	September 18	October 2	October 16	October 31	November 30

Federal Register

FEDERAL REGISTER Published daily, Monday through Friday, (not published on Saturdays, Sundays, or on official holidays), by the Office of the Federal Register, National Archives and Records Administration, Washington, DC 20408, under the Federal Register Act (49 Stat. 500, as amended; 44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). Distribution is made only by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

The **Federal Register** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders and Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress and other Federal agency documents of public interest. Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless earlier filing is requested by the issuing agency.

The **Federal Register** will be furnished by mail to subscribers for $340 per year in paper form; $195 per year in microfiche form; or $37,500 per year for the magnetic tape. Six-month subscriptions are also available at one-half the annual rate. The charge for individual copies in paper or microfiche form is $1.50 for each issue, or $1.50 for each group of pages as actually bound, or $175.00 per magnetic tape. Remit check or money order, made payable to the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, or charge to your GPO Deposit Account or VISA or Mastercard.

There are no restrictions on the republication of material appearing in the **Federal Register.**

How To Cite This Publication: Use the volume number and the page number. Example: 54 FR 12345.

THE FEDERAL REGISTER
WHAT IT IS AND HOW TO USE IT

FOR: Any person who uses the Federal Register and Code of Federal Regulations.

WHO: The Office of the Federal Register.

WHAT: Free public briefings (approximately 3 hours) to present:
1. The regulatory process, with a focus on the Federal Register system and the public's role in the development of regulations.
2. The relationship between the Federal Register and Code of Federal Regulations.
3. The important elements of typical Federal Register documents.
4. An introduction to the finding aids of the FR/CFR system.

WHY: To provide the public with access to information necessary to research Federal agency regulations which directly affect them. There will be no discussion of specific agency regulations.

ATLANTA, GA

WHEN: September 20; at 9:00 a.m.
WHERE: Room 806, 75 Spring Street, SW.
Richard B. Russell Federal Building
Atlanta, GA
RESERVATIONS: Call the Federal Information Center

Rules and Regulations

Federal Register
Vol. 54, No. 170
Tuesday, September 5, 1989

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.
The Code of Federal Regulations is sold by the Superintendent of Documents. Prices of new books are listed in the first FEDERAL REGISTER issue of each week.

DEPARTMENT OF AGRICULTURE

Federal Grain Inspection Service

7 CFR Part 801

Official Performance Requirements for Grain Inspection Equipment

AGENCY: Federal Grain Inspection Service, USDA.

ACTION: Interim final rule.

SUMMARY: To maintain accuracy of field instruments in performing official inspection services, the Federal Grain Inspection Service (FGIS) is amending the regulations under the United States Grain Standards Act, as amended (USGSA) to include maintenance tolerances for near-infrared spectroscopy (NIRS) instruments used in testing soybeans for oil and protein content.

DATES: Effective September 4, 1989; written comments must be submitted on or before November 6, 1989.

ADDRESSES: Comments must be submitted in writing to Lewis Lebakken, Jr., Resources Management Division, USDA, FGIS, Room 0628 South Building, P.O. Box 96454, Washington, DC, 20090-6454. Telemail users may respond to [IRSTAFF/FGIS/USDA] telemail. Telex users may respond as follows: to Lewis Lebakken Jr., TLX:7607351, ANS:FGIS UC. Telecopy users may respond to the automatic telecopier machine at (202) 447-4628.

All comments received will be made available for public inspection at Room 0628 South Building, 1400 Independence Avenue, SW., Washington, DC, during regular business hours (7 CFR 1.27(b)).

FOR FURTHER INFORMATION CONTACT: Lewis Lebakken, Jr., address as above, telephone (202) 475-3428.

SUPPLEMENTARY INFORMATION:

Executive Order 12291

This interim rule has been issued in conformance with Executive Order 12291 and Departmental Regulation 1512-1. This action has been classified as nonmajor because it does not meet the criteria for a major regulation established in the Order.

Regulatory Flexibility Act Certification

W. Kirk Miller, Administrator, FGIS, has determined that this interim rule will not have a significant economic impact on a substantial number of small entities as defined in the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) because most users of the official inspection and weighing services and those entities that perform those services do not meet the requirements for small entities.

Action

In the Federal Register of August 16, 1989 (54 FR 33702) FGIS announced that soybean oil and protein testing would be included as official criteria under the USGSA (7 U.S.C. 71 *et seq.*) effective September 4, 1989. In providing official service upon a request basis, approved near-infrared spectroscopy (NIRS) equipment, including both near-infrared reflectance and near-infrared transmittance equipment, would be used in performing these tests.

Accordingly, FGIS is amending § 801.7 of the regulations (7 CFR 801.7) under the USGSA to include maintenance tolerances for the NIRS equipment used in the testing of soybeans for oil and protein content. Maintenance tolerances allow FGIS to maintain consistent accuracy of field instruments in performing official inspection services. The maintenance tolerance for the NIRS instruments used in performing official inspections for determination of soybean oil shall be +/−0.20 percent, mean deviation from standard solvent extraction; and for determination of protein content shall be +/−0.20 percent, mean deviation from standard Kjeldahl. The appropriateness of these values was verified in field testing by FGIS.

Presently, § 801.7 of the regulations includes maintenance tolerances for the instruments used in the analysis of wheat for protein content, which is an official criteria under the USGSA. As a result, § 801.7 of the regulations will be renamed and the text expanded to include instrument maintenance tolerances for both the wheat protein instruments and the soybean oil and protein instruments. In addition, the provision for NIRS wheat protein analyzers would be revised to correspond to language that appears in the provision for NIRS soybean oil and protein analyzers.

Pursuant to 5 U.S.C. 553, it is found and determined that, upon good cause, it is impracticable, unnecessary, and contrary to the public interest to give notice prior to putting this rule into effect, and that good cause exists for not postponing the effective date of this action until 30 days after publication in the **Federal Register** because: (1) FGIS has determined as announced in the August 16, 1989, **Federal Register** (54 FR 33702) that soybean oil and protein content testing should be available as official criteria under the USGSA, upon a request basis, beginning September 4, 1989; (2) the maitnenance tolerances for NIRS equipment also should be made effective on that date; (3) the soybean harvest is expected to begin in early to mid-September; and (4) a comment period until November 6, 1989, is provided.

List of Subjects in 7 CFR Part 801

Exports, Grains.

For reasons set out in the preamble, 7 CFR part 801 is amended as follows:

PART 801—OFFICIAL PERFORMANCE REQUIREMENTS FOR GRAIN INSPECTION EQUIPMENT

1. The authority citation for part 801 continues to read as follows:

Authority: Pub. L. 94-582, 90 Stat. 2867, as amended (7 U.S.C. 71 *et seq.*).

2. Section 801.7 is revised to read as follows:

§ 801.7 Tolerances for near-infrared spectroscopy (NIRS) analyzers and Kjeldahl analyzers.

(a) *NIRS Wheat Protein Analyzers.* The maintenance tolerance for the NIRS analyzers used in performing official inspection for determination of wheat protein content shall be +/−0.15 percent, mean deviation from standard Kjeldahl.

(b) *NIRS Soybean Oil and Protein Analyzers.* The maintenance tolerance for the NIRS instruments used in performing official inspections for determination of soybean oil shall be +/−0.20 percent, mean deviation from standard solvent extraction; and for determination of protein content shall be +/−0.20 percent, mean deviation from standard Kjeldahl.

(c) *Kjeldahl.* The maintenance tolerance for Kjeldahl analyzers used in performing official inspection services shall be +/−0.15 percent, standard deviation.

Dated: August 25, 1989.

D. R. Galliart,

Acting Administrator.

[FR Doc. 89-20871 Filed 9-1-89; 8:45 am]

BILLING CODE 3410-EN-M

Agricultural Marketing Service

7 CFR Part 910

[Lemon Reg. 681]

Lemons Grown in California and Arizona, Limitation of Handling

AGENCY: Agricultural Marketing Service, USDA.

ACTION: Final rule.

SUMMARY: Regulation 681 establishes the quantity of fresh California-Arizona lemons that may be shipped to market at 300,000 cartons during the period September 3 through September 9, 1989. Such action is needed to balance the supply of fresh lemons with market demand for the period specified, due to the marketing situation confronting the lemon industry.

DATES: Regulation 681 (7 CFR Part 910) is effective for the period September 3 through September 9, 1989.

FOR FURTHER INFORMATION CONTACT: Beatriz Rodriguez, Marketing Specialist, Marketing Order Administration Branch, F&V, AMS, USDA, Room 2523, South Building, P.O. Box 96456, Washington, DC 20090-6456; telephone: (202) 475-3861.

SUPPLEMENTARY INFORMATION: This final rule has been reviewed under Executive Order 12291 and Departmental Regulation 1512-1 and has been determined to be a "non-major" rule under criteria contained therein.

Pursuant to requirements set forth in the Regulatory Flexibility Act (RFA), the Administrator of the Agricultural Marketing Service has determined that this action will not have a significant economic impact on a substantial number of small entities.

The purpose of the RFA is to fit regulatory action to the scale of business subject to such actions in order that small businesses will not be unduly or disproportionately burdened. Marketing orders issued pursuant to the Agricultural Marketing Agreement Act, and rules issued thereunder, are unique in that they are brought about through group action of essentially small entities acting on their own behalf. Thus, both statutes have small entity orientation and compatibility.

There are approximately 85 handlers of lemons grown in California and Arizona subject to regulation under the lemon marketing order and approximately 2500 producers in the regulated area. Small agricultural producers have been defined by the Small Business Administration (13 CFR 121.2) as those having annual gross revenues for the last three years of less than $500,000, and small agricultural service firms are defined as those whose gross annual receipts are less than $3,500,000. The majority of handlers and producers of California-Arizona lemons may be classified as small entities.

This regulation is issued under Marketing Order No. 910, as amended (7 CFR part 910), regulating the handling of lemons grown in California and Arizona. The order is effective under the Agricultural Marketing Agreement Act (the "Act," 7 U.S.C. 601-674), as amended. This action is based upon the recommendation and information submitted by the Lemon Administrative Committee (Committee) and upon other available information. It is found that this action will tend to effectuate the declared policy of the Act.

This regulation is consistent with the California-Arizona lemon marketing policy for 1989-90. The Committee met publicly on August 29, 1989, in Los Angeles, California, to consider the current prospective conditions of supply and demand and unanimously recommended a quantity of lemons deemed advisable to be handled during the specified week. The Committee reports that overall demand for lemons is good.

Pursuant to 5 U.S.C. 553, it is further found that it is impracticable, unnecessary, and contrary to the public interest to give preliminary notice and engage in further public procedure with respect to this action and that good cause exists for not postponing the effective date of this action until 30 days after publication in the **Federal Register** because of insufficient time between the date when information became available upon which this regulation is based and the effective date necessary to effectuate the declared purposes of the Act. Interested persons were given an opportunity to submit information and views on the regulation at an open meeting. It is necessary, in order to effectuate the declared purposes of the Act, to make these regulatory provisions effective as specified, and handlers have been apprised of such provision and the effective time.

List of Subjects in 7 CFR Part 910

Arizona, California, Lemons, Marketing agreements and orders.

For the reasons set forth in the preamble, 7 CFR part 910 is amended as follows:

PART 910—LEMONS GROWN IN CALIFORNIA AND ARIZONA

1. The authority citation for 7 CFR Part 910 continues to read as follows:

Authority: Sec. 1-19, 48 Stat. 31, as amended; 7 U.S.C. 601-674.

2. Section 910.981 is added to read as follows:

Note: This section will not appear in the Code of Federal Regulations.

§ 910.981 Lemon Regulation 681.

The quantity of lemons grown in California and Arizona which may be handled during the period September 3, 1989, through September 9, 1989, is established at 300,000 cartons.

Dated: August 30, 1989.

BILLING CODE 3410-02-M

---

7 CFR Part 1036

[Docket No. AO-179-A52; DA-88-113]

Milk in the Eastern Ohio-Western Pennsylvania Marketing Area; Order Amending Order

AGENCY: Agricultural Marketing Service, USDA.

ACTION: Final rule.

SUMMARY: This action changes the classification provisions of the Eastern Ohio-Western Pennsylvania milk order based on industry proposals considered at a public hearing held November 1, 1988. The classification of milk used to make buttermilk biscuit and pancake mixes is changed from Class I to Class III, eliminating raw product cost differences for milk so used between the Eastern Ohio-Western Pennsylvania order and surrounding Federal order markets. The requirement that handlers obtain prior approval from the market administrator if milk dumped at the plant is to be classified as Class III is eliminated. These changes are necessary to reflect current marketing conditions and maintain orderly

marketing in the Eastern Ohio-Western Pennsylvania marketing area.

More than two-thirds of the producers whose milk was pooled under the Eastern Ohio-Western Pennsylvania order in April 1989 and who voted in a referendum approved the issuance of the amended order.

EFFECTIVE DATE: October 1, 1989.

FOR FURTHER INFORMATION CONTACT: Constance M. Brenner, Marketing Specialist, USDA/AMS/Dairy Division, Order Formulation Branch, Room 2968, South Building, P.O. Box 96456, Washington, DC 20090-6456, (202) 447-7183.

SUPPLEMENTARY INFORMATION: Prior documents in this proceeding:

Notice of Hearing: Issued October 13, 1988; published October 18, 1988 (53 FR 40733).

Recommended Decision: Issued April 13, 1989; published April 18, 1989 (54 FR 15413).

Final Decision: Issued July 20, 1989; published July 25, 1989 (54 FR 30898).

Findings and Determinations

The findings and determinations hereinafter set forth supplement those that were made when the Eastern Ohio-Western Pennsylvania order was first issued and when it was amended. The previous findings and determinations are hereby ratified and confirmed, except where they may conflict with those set forth herein.

(a) *Findings upon the basis of the hearing record.* Pursuant to the provisions of the Agricultural Marketing Agreement Act of 1937, as amended (7 U.S.C. 601-674), and the applicable rules of practice and procedure governing the formulation of marketing agreements and marketing orders (7 CFR part 900), a public hearing was held upon certain proposed amendments to the tentative marketing agreement and to the order regulating the handling of milk in the Eastern Ohio-Western Pennsylvania marketing area.

Upon the basis of the evidence introduced at such hearing and the record thereof, it is found that:

(1) The said order as hereby amended, and all of the terms and conditions thereof, will tend to effectuate the declared policy of the Act;

(2) The parity prices of milk, as determined pursuant to section 2 of the Act, are not reasonable in view of the price of feeds, available supplies of feeds, and other economic conditions which affect market supply and demand for milk in the said marketing area; and the minimum prices specified in the order as hereby amended are such prices as will reflect the aforesaid factors, insure a sufficient quantity of pure and wholesome milk, and be in the public interest; and

(3) The said order as hereby amended regulates the handling of milk in the same manner as, and is applicable only to persons in the respective classes of industrial or commercial activity specified in, a marketing agreement upon which a hearing has been held.

(b) *Determinations.* It is hereby determined that:

(1) The refusal or failure of handlers (excluding cooperative associations specified in section 8c (9) of the Act) of more than 50 percent of the milk, which is marketed within the marketing area, to sign a proposed marketing agreement, tends to prevent the effectuation of the declared policy of the Act;

(2) The issuance of this order amending the order is the only practical means pursuant to the declared policy of the Act of advancing the interests of producers as defined in the order; and

(3) The issuance of the order amending the order is approved or favored by at least two-thirds of the producers who participated in a referendum and who during the determined representative period were engaged in the production of milk for sale in the marketing area.

List of Subjects in 7 CFR Part 1036

Dairy products, Milk, Milk marketing orders.

Order Relative to Handling

It is therefore ordered, that on and after the effective date hereof, the handling of milk in the Eastern Ohio-Western Pennsylvania marketing area shall be in conformity to and in compliance with the terms and conditions of the aforesaid order, as amended, and as hereby further amended, as follows:

PART 1036—MILK IN THE EASTERN OHIO-WESTERN PENNSYLVANIA MARKETING AREA

1. The authority citation for 7 CFR part 1036 continues to read as follows:

Authority: Secs. 1-19, 48 Stat. 31, as amended; 7 U.S.C. 601-674.

2. Section 1036.40 is amended by revising paragraphs (c) (1) and (3) to read as follows:

§ 1036.40 Classes of utilization.

* * * * *

(c) * * *

(1) Skim milk and butterfat used to produce butter, cheese (excluding cottage cheese and cottage cheese curd), evaporated or condensed milk or skim milk (plain or sweetened) in a consumer-type package, any concentrated milk product in bulk, fluid form used to produce Class III products, nonfat dry milk, dry whole milk, dry whey, condensed or dry buttermilk, buttermilk biscuit and pancake mixes, any product containing six percent or more nonmilk fat (or oil) and sterilized products (except fluid cream products and those products listed in paragraph (b)(3) of this section) in hermetically sealed glass or metal containers;

* * * * *

(3) Skim milk and butterfat in fluid milk products, fluid cream products and products listed in paragraph (b)(3) of this section that are dumped by a handler who maintains adequate records of such use and notifies the market administrator of such use on the next business day following such use.

Signed at Washington, DC, on: August 30, 1989.

Jo Ann R. Smith,

Assistant Secretary, Marketing and Inspection Services.

[FR Doc. 89-20772 Filed 9-1-89; 8:45 am]

BILLING CODE 3410-02-M

DEPARTMENT OF JUSTICE

Immigration and Naturalization Service

8 CFR Part 204

[INS No. 1049-89]

RIN 1115-AA76

Petition to Classify Alien as Immediate Relative of a United States Citizen or as a Preference Immigrant

AGENCY: Immigration and Naturalization Service, Justice.

ACTION: Final rule.

SUMMARY: This rule implements section 101(b)(1)(D) of the Immigration and Nationality Act as amended by the Immigration Reform and Control Act of 1986 (Pub. L. 99-603), which recognizes the relationship between a biological father and his illegitimate child for immediate relative and preference petitioning purposes. It also establishes procedures for filing for immigration benefits based on this relationship. This will assist Service administration and public understanding on the documentary evidence necessary to establish that a bona-fide parent/child relationship exists or existed between a natural father and his illegitimate child.

EFFECTIVE DATE: September 5, 1989.

FOR FURTHER INFORMATION CONTACT: Yolanda Sanchez-K., Senior

Immigration Examiner, Immigration and Naturalization Service, 425 I Street NW., Room 7223, Washington, DC 20536, (202) 633–5014.

SUPPLEMENTARY INFORMATION: On March 17, 1989, the Immigration and Naturalization Service published in the **Federal Register** (54 FR 11160) an interim rule to amend 8 CFR 204.2(c)(3), (4), and (5) to provide guidance on eligibility criteria under this section, as well as identify acceptable documentary evidence to support one's claim to eligibility.

Under prior regulation and statute, fathers of out-of-wedlock children were not eligible to petition for or be petitioned by their children. With the passage of Public Law 99–603, the Immigration Reform and Control Act of 1986, fathers may now petition for or be petitioned by their illegitimate children if they establish that a bona-fide parent/child relationship exists or existed and if otherwise eligible. To implement this provision under IRCA, the Service has promulgated this rule which provides guidelines on identification of a natural father and procedures for filing for immigration benefits under this section.

During the comment period, the Service received two comments. Both commentors recommended technical changes to the interim rule which have been considered and incorporated into the final rule.

One commentor pointed out that the interim rule does not address cases in which a father legitimates a child. It was recommended that the final rule distinguish between the filing of a petition on behalf of an illegitimate child and a legitimated child. The Service agrees that a distinction is necessary and has amended the final rule accordingly.

The second commentor requested that, for brother/sister relationships, the final rule be amended to require evidence which evinces or evinced an active parental concern only where the "common parent" is the father who "fathered" the out of wedlock child. The interim rule appears to omit qualified brothers and sisters where the "common parent" is the mother; and, consequently evidence that an active concern for the child's support is/has been evinced is not required under the Act as amended. The final rule is amended to reflect this recommendation.

In accordance with 5 U.S.C. 605(b), the Commissioner of the Immigration and Naturalization Service certifies that this rule does not have a significant economic impact on a substantial number of small entities. This is not a major rule within the meaning of section 1(b) of E.O. 12291, nor does this rule have federalism implications warranting the preparation of a Federal Assessment in accordance with E.O. 12612.

This amendment is a substantive rule that recognizes and implements the amendment to INA section 101(b)(1)(D) that removed the restriction on approval of alien relative visa petitions based on the relationship between a man and his out-of-wedlock child. Therefore, it is not necessary to delay the effective date until at least 30 days after publication in the **Federal Register** (5 U.S.C. 553(d)(1)).

The information collection requirements contained in this rule have been approved by the Office of Management and Budget under the provisions of the Paperwork Reduction Act under control number #1115–0054.

List of Subjects in 8 CFR Part 204

Administrative practice and procedures, Petition, Reporting and recordkeeping requirements.

Accordingly, part 204 of chapter 1 of title 8, Code of Federal Regulations, is amended as follows:

PART 204—PETITION TO CLASSIFY ALIEN AS IMMEDIATE RELATIVE OF A UNITED STATES CITIZEN OR AS A PREFERENCE IMMIGRANT

1. The authority citation for part 204 continues to read as follows:

Authority: 66 Stat. 166, 173, 175, 178, 179, 182, 217, 100 Stat. 3537; 8 U.S.C. 1101, 1103, 1151, 1153, 1154, 1182, 1186a, 1255, and 8 CFR part 2.

2. In § 204.2 paragraphs (c)(3) through (5) are revised to read as follows:

§ 204.2 Documents.

* * * * *

(c) * * *

(3) *Petition for child.* (i) If a Form I–130, "Petition for Alien Relative", is submitted to the Service by a mother in behalf of a child, regardless of the child's age, the birth certificate of the child showing the name of the mother must accompany the petition. If a petition is submitted by a father in behalf of a legitimate child or by a stepparent in behalf of a stepchild, regardless of the child's age, a certificate of marriage of the parents, proof of legal termination of their prior marriages, and the birth certificate of the child must accompany the petition. If the petition is submitted by a father in behalf of a legitimated child, regardless of the child's age, evidence of the legitimation which must have occurred prior to the child's eighteenth birthday, proof of legal termination of parent's prior marriages if legitimation resulted from the natural parents' marriage to each other, and the birth certificate of the child must accompany the petition. If the petition is submitted by the purported father of a child born out-of-wedlock, regardless of the child's age, the father must establish that he is the natural father and that a bona fide parent-child relationship exists or has existed. Such a relationship exists or has existed where the father evinces or has evinced an active concern for the child's support, instruction, and general welfare. Furthermore, the parent-child relationship must be or have been established while the child is or was unmarried and under twenty-one (21) years of age. Once established, benefits may be sought at a later date pursuant to section 201(b) or 203(a) of the Act, provided that all other eligibility criteria under the appropriate section have been met and that a parent-child relationship exists or has existed. Evidence to establish that the petition is the child's natural parent may include, but is not limited to the following:

(A) The beneficiary's birth certificate or religious documents relating to birth or baptism of the beneficiary;

(B) Local civil records;

(C) Affidavits from knowledgeable witnesses, and/or;

(D) Evidence of financial support of the child by the putative father.

(ii) The district director may require a specific Blood Group Antigen Test to be conducted of the petitioner, beneficiary and beneficiary's mother on Form G–620. If the Specific Blood Group Antigen Test does not exclude paternity and the district director determines additional evidence is needed, a Human Leucocyte Antigen (HLA) test may be required. Such blood tests will be conducted, at the expense of the petitioner or beneficiary, by the United States Public Health Service or by a qualified medical specialist designated by the District Director. Refusal to submit to a Specific Blood Group or HLA blood test when required may constitute a basis for denial of the petition.

(4) *Petition for a brother or sister.* If a sibling relationship is claimed through a common mother, the petition shall be supported by a birth certificate of the petitioner and a birth certificate of the beneficiary showing a common mother. If the petition is on behalf of a brother or sister having a common father and different mothers, the birth certificate of the petitioner and the birth certificate of the beneficiary showing a common father along with the marriage certificate (if applicable) of the petitioner's parents, the marriage certificate (if applicable) of the beneficiary's parents, and proof of the

legal termination of the parents' prior marriages, if any, must accompany the petition. If either the petitioner or the beneficiary is a child born out-of-wedlock and the common parent is the father, evidence to establish legitimation prior to the child's eighteenth birthday or evidence that the father and child have or had a bona fide parent-child relationship as described in paragraph (c)(3) of this section for a child born out-of-wedlock must accompany the petition.

(5) *Petition in behalf of a parent.* If a petition is submitted in behalf of a mother, the petitioner's birth certificate showing the name of the mother must accompany the petition. If a petition is submitted in behalf of a father of a legitimate child or a stepparent, the petitioner's birth certificate and the marriage certificate of his or her parent (if applicable) and stepparent must accompany the petition, as well as proof of the legal termination of their prior marriages, if any. If a petition is submitted in behalf of a father of a legitimated child, the petitioner's birth certificate and evidence of the petitioner's legitimation which must have occurred prior to his or her eighteenth birthday must accompany the petition. If legitimation was based on the natural parents' marriage to each other, evidence of the legal termination of the parents' prior marriages, if any, must also accompany the petition. If a petition is submitted by a petitioner born out-of-wedlock on behalf of his or her natural father, evidence to establish that the beneficiary is the petitioner's natural parent as described in paragraph (c)(3) of this section for a child born out-of-wedlock, and evidence that a parent-child relationship exists or has existed, must accompany the petition.

BILLING CODE 4410-10-M

DEPARTMENT OF AGRICULTURE

Food Safety and Inspection Service

9 CFR Part 310

[Docket No. 86–012–F]

RIN 0583–AA48

Use of Air During Slaughter Operations

AGENCY: Food Safety and Inspection Service, USDA.

ACTION: Final rule.

SUMMARY: The Food Safety and Inspection Service (FSIS) is amending the Federal meat inspection regulations to provide for the approval of several procedures which have been field tested and found acceptable for the inflation of carcasses and parts of carcasses with compressed air injected during dressing operations to facilitate head skinning and the removal of hides and foot hair. Two comments were received in response to the proposal. After careful consideration of the comments received, FSIS is adopting the proposal as published. This action will permit the use of these voluntary alternate procedures for use during slaughter operations in official establishments without requiring further testing or additional written approval.

EFFECTIVE DATE: October 5, 1989.

FOR FURTHER INFORMATION CONTACT: Dr. Jill Hollingsworth, Director, Slaughter Inspection Standards and Procedures Division, Technical Services, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250, (202) 447–3219.

SUPPLEMENTARY INFORMATION:

Executive Order 12291

The Administrator has determined in accordance with Executive Order 12291 that this rule is not a "major rule." It will not result in an annual effect on the economy of $100 million or more. There will be no major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions, and it will not have a significant effect on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets. This rule will provide official slaughtering establishments with voluntary alternate procedures for use during slaughter operations, by permitting approved methods of injecting compressed air to facilitate head skinning and the removal of hides and foot hair.

Effect on Small Entities

The Administrator has determined that this rule will not have a significant economic impact on a substantial number of small entities as defined by the Regulatory Flexibility Act, Public Law 96–354 (5 U.S.C. 601). The rule will relieve a current regulatory restriction with respect to the use of air injection into carcasses and parts of carcasses; and, it will provide all official slaughtering establishments with voluntary alternate procedures for use during slaughter operations, by permitting approved methods of compressed air injection without imposing additional requirements.

Paperwork Requirements

This rule will require that establishment which would like to test new procedures for the use of air, submit a request to FSIS for approval. (This paperwork requirement will be submitted to the Office of Management and Budget for approval under control number 0583–0015).

Background

Section 310.13 of the Federal meat inspection regulations (9 CFR 310.13) provides, in part, that carcasses or parts of carcasses shall not be inflated with air. The original intent in disallowing the use of air was to aid in the prevention of adulterated carcasses or parts of carcasses. In particular, the insanitary use of injected air may contaminate the carcass or part or mask abnormal conditions. Section 1(m)(4) of the Federal Meat Inspection Act (FMIA) (21 U.S.C. 601(m)(4)) provides that any carcass, part thereof, meat or meat food product is adulterated "if it has been prepared * * * under insanitary conditions whereby it may have become contaminated with filth, or whereby it may have been rendered injurious to health; * * *" If the air were unclean or if there were a contaminated injection procedure, the carcass might become contaminated. Additionally, it was believed that the presence of air in subcutaneous tissues could mask an abnormal condition such as a gas-producing bacterial infection. Section 1(m)(8) of the FMIA (21 U.S.C. 601(m)(8)) provides that any carcass, part thereof, meat or meat food product is adulterated "* * * if damage or inferiority has been concealed in any manner; * * *" Such adulteration could occur by filling out hollows in the animal carcass to make the animal appear of better quality. Thus, FSIS prohibited the use of air to inflate carcasses or parts of carcasses on the basis that the air may be used in an insanitary manner or may mask abnormal conditions, resulting in product adulteration under the FMIA.

Recently, several establishments requested permission to use injected air for hide removal. FSIS determined, at that time, that if establishments could demonstrate that the use of air would result in wholesome, unadulterated meat products, such additional procedures could allow more efficient dressing operations for slaughter establishments. Therefore, FSIS has permitted, on an experimental basis and under close FSIS monitoring, various uses of air during the dressing operations at several establishments. These uses included:

(1) Compressed air injected into cattle feet to facilitate the removal of hair from feet intended for human consumption.

(2) Compressed air injected into the skull of an animal in conjunction with a captive bolt stunner to aid in holding the animal still during the bleeding operation so that fewer injuries to establishment employees would occur.

(3) Compressed air injected under the skin of cattle heads to facilitate head skinning prior to the use of a down hide-puller.

(4) Compressed air injected into the abdominal cavity of swine to facilitate the skinning operation and to minimize the loss of body fat.

Many cattle slaughter establishments are currently requesting authorization to use air injection for hide removal. These establishments wish to accomplish three things: First, reduce equipment and carcass damage by reducing the amount of tension which must be applied to remove the hide from the head and neck with a down hide-puller; second, prevent damage to the hide in the removal process; and third, reduce contamination of the head when the hide is removed intact.

The above described uses, after field testing, were found to be acceptable. The sanitary injection of air did not mask abnormal carcass conditions and did not contaminate carcasses or parts. Microbiological testing has proven that air injection can be sanitary. The Agency now believes that air injection can be performed in a sanitary manner by a procedure that includes air filtration and injection needle disinfection. Air filtration would consist of not less than two stages. An initial stage of filtration would occur at or near the use point and would consist of an aerosol or coalescing filter, capable of filtration to not more than 0.75 micron, for the removal of oil and water. A subsequent stage of filtration would occur at or near the point of needle hose attachment to the air line and would be a particulate filter, capable of filtration to not more than 0.3 micron. The filters would be maintained by inspecting regularly to assure they are working properly, and cleaned or replaced when necessary. The injection needle would be disinfected by placement in water that is not less than 180 °F. for at least 10 seconds immediately prior to each injection. Therefore, the Administrator believes it is now appropriate to amend the Federal meat inspection regulations to allow certain uses of air. On January 13, 1989, FSIS published a proposed rule (54 FR 1370) to approve the use of injected air as listed in the cited examples.

This final rule will allow permanent approval of only the compressed air injection activities in the examples listed above. Any official establishment interested in the use of air for other than these approved methods will be required to submit a request for experimental testing of any unapproved procedure to FSIS for approval, prior to its use. These requests must state the purpose of the use of air, a detailed description of the procedure, and evidence that the procedure can be performed in a sanitary manner. Final approval of an acceptable new proposed method can be obtained by modifying, through rulemaking procedures, the Federal regulations to include the new method.

Comments on the Proposed Rule

On January 13, 1989, a proposed rule was published. FSIS received two comments in response to the proposal (54 FR 1370): One from a professional association and one from private industry. Both commenters were in support of the proposed rule. The reasons cited were that slaughter "processing" would be more cost effective, and that the reduced tension in hide removal would lower the potential for employee injury.

Final Rule

List of Subjects in 9 CFR Part 310

Meat inspection; Post-mortem inspection.

For reasons discussed in the preamble, FSIS is amending 9 CFR part 310 of the Federal meat inspection regulations as follows:

PART 310—POST-MORTEM INSPECTION

1. The authority citation for 9 CFR part 310 continues to read as follows:

Authority: 34 Stat. 1260, 79 Stat. 903, as amended, 81 Stat. 584, 84 Stat. 91, 438; 21 U.S.C. 71 *et seq.*, 601 *et seq.*, 33 U.S.C. 1254(b).

2. Section 310.13 would be revised in its entirety to read as follows:

§ 310.13 Inflating carcasses or parts thereof; transferring caul or other fat.

(a)(1) Establishments shall not inflate carcasses or parts of carcasses with air, except as set forth in paragraph (a)(2) of this section.

(2)(i) Any establishment slaughtering livestock that wishes to inflate carcasses or parts thereof with air, using procedures other than the approved methods listed below, shall submit a request for approval for experimental testing to the Administrator. Such a request shall include the purpose of the use of air, a detailed description of the procedure for injecting the air and evidence that the procedure can be performed in a sanitary manner.

(ii) The Administrator shall evaluate newly submitted procedures for the use of air. If the Administrator determines that any such procedure will likely result in wholesome, unadulterated meat product, then the Administrator shall approve experimental testing of the new procedure. In any situation where the Administrator finds a submitted procedure to be unlikely to result in wholesome, unadulterated meat product, the Administrator shall send written notification to the establishment of the denial of such approval. The establishment may re-submit for evaluation a testing procedure that has been denied, provided that modifications have been made to address the original reason for denial. The establishment also shall be afforded an opportunity to submit a written statement in response to the notification of denial. In those instances where there is a conflict of facts, a hearing, under applicable rules of practice, will be held to resolve the conflict.

(iii) Final approval of an acceptable new proposed method shall be effectuated by modifying, through rulemaking procedures, the Federal regulations to include the new method.

(iv) Uses for which approval is granted are:

(A) Compressed air injection of cattle feet to facilitate removal of hair from feet intended for human consumption;

(B) Compressed air injection under the skin of cattle heads to facilitate head skinning; or

(C) Compressed air injection into the skull in conjunction with a captive bolt stunner to hold the animal still for dressing operations.

The method of compressed air injection shall be a sanitary procedure that includes air filtration and injection needle disinfection. Air filtration shall consist of not less than two stages. An initial stage of filtration shall occur at or near the use point and shall consist of an aerosol or coalescing filter, capable of filtration to not more than 0.75 micron, for the removal of oil and water. A subsequent stage of filtration shall occur at or near the point of needle hose attachment to the air line and shall be a particulate filter, capable of filtration to not more than 0.3 micron. The filters shall be maintained by inspecting

regularly to assure they are working properly, and cleaned or replaced when necessary. The injection needle shall be disinfected by placement in water that is not less than 180 °F. for at least 10 seconds immediately prior to each injection.

(b) Transferring the caul or other fat from a fat to a lean carcass is prohibited.

(Approved by the Office of Management and Budget under control number 0583-0015).

Done at Washington, DC, on August 30, 1989.

Lester M. Crawford,

Administrator, Food Safety and Inspection Service.

BILLING CODE 3410-DM-M

NUCLEAR REGULATORY COMMISSION

10 CFR Part 9

RIN 3150-AD29

Duplication Fees

AGENCY: Nuclear Regulatory Commission.

ACTION: Final rule.

SUMMARY: The Nuclear Regulatory Commission (NRC) is amending its regulations by revising the charges for copying records publicly available at the NRC Public Document Room in Washington, DC. The amendment is necessary in order to reflect the change in copying charges resulting from the Commission's award of a new contract for the copying of records.

EFFECTIVE DATE: September 5, 1989.

FOR FURTHER INFORMATION CONTACT: Kathleen E. Ruhlman, Public Document Room Branch, Office of the Secretary, U.S. Nuclear Regulatory Commission, Washington, DC 20555, telephone 202-634-3366.

SUPPLEMENTARY INFORMATION: The NRC maintains a Public Document Room (PDR) at its headquarters at 2120 L Street NW., Lower Level, Washington, DC. The PDR contains an extensive collection of publicly available technical and administrative records that the NRC receives or generates. Requests by the public for the duplication of records at the PDR have traditionally been accommodated by a duplicating service contractor selected by the NRC. The schedule of duplication charges to the public established in the duplicating service contract is set forth in 10 CFR 9.35 of the Commission's regulations. The NRC has recently awarded a new duplicating service contract. The revised fee schedule reflects the changes in copying charges to the public that have resulted from the awarding of the new contract for the duplication of records at the PDR.

Because this is an amendment dealing with agency practice and procedures, the notice provisions of the Administrative Procedures Act do not apply pursuant to 5 U.S.C. 553(b)(A). In addition, the PDR users were notified on June 30, 1989, that the new contract was being awarded and that the new prices would go into effect on July 10, 1989. The amendment is effective upon publication in the **Federal Register**. Good cause exists to dispense the usual 30-day delay in the effective date because the amendment is of a minor and administrative nature dealing with agency procedures.

Environmental Impact: Categorical Exclusion

The NRC has determined that this final rule is the type of action described in categorical exclusion 10 CFR 51.22(c)(1).

Therefore, neither an environmental impact statement nor an environmental assessment has been prepared for this final rule.

Paperwork Reduction Act Statement

This final rule does not contain a new or amended information collection requirement subject to the Paperwork Reduction Act of 1980 (44 U.S.C. 3501 et seq.). Existing requirements were approved by the Office of Management and Budget approval number 3150-0043.

Backfit Analysis

This final rule pertains solely to minor administrative procedures of the NRC; therefore, no backfit analysis has been prepared.

List of Subjects in 10 CFR Part 9

Freedom of information, Penalty, Privacy, Reporting and recordkeeping requirements, Sunshine Act.

For the reasons set out in the preamble and under the authority of the Atomic Energy Act of 1954, as amended, the Energy Reorganization Act of 1974, as amended, and 5 U.S.C. 552 and 553, the NRC is adopting the following amendment to 10 CFR part 9.

PART 9—PUBLIC RECORDS

1. The authority citation for part 9 continues to read in part as follows:

Authority: Sec. 161, 68 Stat. 948, as amended (42 U.S.C. 2201); Sec. 201, 88 Stat. 1242, as amended (42 U.S.C. 5841).

2. In § 9.35, paragraph (a)(1) is revised to read as follows:

§ 9.35 Duplication fees.

(a)(1) Charges for the duplication of records made available under § 9.21 at the NRC Public Document Room (PDR), 2120 L Street, Lower Level, NW., Washington, DC by the duplicating service contractor are as follows:

(i) 5.8 cents per page for paper copy to paper copy, except for engineering drawings and any other records larger than 17 x 11 inches for which the charges vary as follows depending on the reproduction process that is used:

(A) Xerographic process—$1.50 per square foot for large documents or engineering drawings (random size up to 24 inches in width and with variable length) reduced or full size;

(B) Photographic process—$6.75 per square foot for large documents or engineering drawings (random size exceeding 24 inches in width up to a maximum size of 42 inches in length) full size only.

(ii) 5.8 cents per page for microform to paper copy, except for engineering drawings and any other records larger than 17 x 11 inches for which the charge is $1.35 per square foot or $2.95 for a reduced size print which the charge is $1.35 per square foot or $2.95 for a reduced size print (18 x 24 inches).

(iii) 85 cents per microfiche to microfiche.

(iv) 85 cents per aperture card to aperture card.

BILLING CODE 7590-01-M

FEDERAL HOUSING FINANCE BOARD

12 CFR Chapters V and IX

[No. FHFB 89-1]

Establishment of Chapter IX and Redesignation of Regulations From Chapter V

Dated: August 28, 1989.

AGENCY: Federal Housing Finance Board.

ACTION: Final rule.

SUMMARY: By this document the Federal Housing Finance Board ("FHFB" or "Board") establishes chapter IX in title 12 of the Code of Federal Regulations for publication of its rules, regulations, and policy statements. The Board is an independent agency in the Executive

Branch of the Government, established by the Federal Home Loan Bank Act, as amended by Public Law 101–73. The Board is also redesignating certain regulations concerning the Federal Home Loan Bank System and the Financing Corporation which formerly appeared at chapter V of title 12, Code of Federal Regulations.

EFFECTIVE DATE: September 5, 1989.

FOR FURTHER INFORMATION CONTACT: James H. Grey, Jr., Attorney, (202) 906–6161; or Charles J. Szlenker, Attorney, (202) 906–6664, Federal Housing Finance Board Task Force.

SUPPLEMENTARY INFORMATION:

A. General

The Financial Institutions Reform, Recovery, and Enforcement Act of 1989, Public Law No. 101–73, abolished the Federal Home Loan Bank Board and established the FHFB as an independent agency in the executive branch of the Government responsible for overseeing the Federal home loan banks. Regulations concerning the Federal Home Loan Bank System were contained in title 12 CFR parts 521–35, while regulations concerning the Financing Corporation were contained in part 592 of title 12. These regulations were issued under the authority of the former Federal Home Loan Bank Board. Section 402(h) of Public Law No. 101–73 preserves the authority of Federal Home Loan Bank Board regulations unless terminated or superseded by the appropriate successor agency.

This document establishes the FHFB regulations in title 12, chapter IX of the Code of Federal Regulations. The table of contents for chapter IX set forth below includes regulations which are issued in this final rule, as well as the part titles of other materials which the FHFB intends to issue in the near future and reserved part titles. The regulations are being transferred from parts 521–35 and 592 without any change in substantive or technical matters or nomenclature in order to accomplish an expedient transfer of authority from the defunct Federal Home Loan Bank Board to the FHFB. Where the transferred regulations refer to the "Board" (defined in the regulations being transferred as the Federal Home Loan Bank Board (12 CFR 521.3)) it is intended that this term "Board" apply to the FHFB, until the definition is corrected in a later technical amendment.

B. Directors

Section 707 of Public Law No. 101–73 amends the Federal Home Loan Bank Act provisions concerning the election or appointment of Federal home loan bank directors. Sections 522.20–522.27 of the transferred regulations deal with the election and appointment of Federal home loan bank directors under provisions of the Federal Home Loan Bank Act prior to its amendment by Public Law 101–73. Where these transferred sections have been superseded by the Federal Home Loan Bank Act amendments, they are inoperative and will be amended as soon as practical.

C. Indemnification

Section 707(k) of Public Law No. 101–73 provides that the directors of a Federal home loan bank will determine the conditions under which a director or officer of the Federal home loan bank will be indemnified. Until such time as this provision is implemented by the Federal home loan banks under the oversight of the FHFB, § 522.72 of the transferred regulations continues to be in force.

D. Miscellaneous

Public Law No. 101–73 amends Federal Home Loan Bank Act section 2b(b)(2) and abolishes all joint offices of the Federal home loan banks except the Office of Finance. Sections 522.80 through 522.90 are transferred in their entirety until the FHFB can implement section 2b, as amended, and repeal these sections as appropriate.

In general, the transferred regulations include provisions addressing liquidity requirements for savings associations which are members of a Federal Home Loan Bank System as well as collateral required of a member institution receiving an advance from a Federal home loan bank. Some of the transferred provisions have been superseded by changes to the Federal Home Loan Bank Act. The regulations are being transferred in their entirety and the FHFB will promulgate appropriate amendments as soon as practical.

Sections 506.1 through 506.6 and §§ 506a.1 through 506a.9 of title 12, Code of Federal Regulations, dealing with issuance of Federal home loan bank consolidated bonds or debenture and book entry issuance of consolidated bonds, respectively, are being transferred to chapter IX of title 12.

The FHFB is transferring these regulations, even where the provisions have been superseded by statute, to effect an efficient and convenient transfer of authority from the defunct Federal Home Loan Bank Board to the FHFB. Where appropriate or required, the FHFB will amend the transferred regulations or promulgate new regulations in order to comply with the sweeping changes to the Federal Home Loan Bank System mandated by Public Law No. 101–73.

E. Administrative Procedure Act

The transferred regulations were previously promulgated by the former Federal Home Loan Bank Board after notice and an opportunity for public comment where required. Therefore, a notice of proposed rulemaking and a comment period in this case is unnecessary. Moreover, the Board finds that the interest of the public and the Federal Home Loan Bank System are served if these regulations are transferred to the auspices of the Board, as mandated by Public Law No. 101–73, as soon as possible. Consequently these rules will be effective immediately and without prior notice and opportunity for public comment. The FHFB is empowered to take this action pursuant to 12 CFR 508.11 and 508.14 which continue in effect despite the termination of the Federal Home Loan Bank Board, under provision by Public Law 101–73.

F. Regulatory Flexibility Act

Because no notice of proposed rulemaking is required for this regulation, the provisions of the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) do not apply.

Authority: Secs. 2A, 2B, as added by sec. 702, 103 Stat. 413, 414 (12 U.S.C. 1422a, 1422b).

Accordingly, the Federal Housing Finance Board hereby amends chapter V and establishes a new chapter IX, title 12, Code of Federal Regulations, as set forth below.

1. Title 12 is amended by adding a chapter IX (consisting of subchapters A through D) to read as follows:

CHAPTER IX—FEDERAL HOUSING FINANCE BOARD

SUBCHAPTER A—GENERAL

Part
900 Organization and channeling of functions [Reserved].
902 Operations [Reserved].
904 Availability and Character of Records [Reserved].
906 Public information regarding meetings of the Board of Directors of the Federal Housing Finance Board [Reserved].
908 Information collection requirements under the Paperwork Reduction Act [Reserved].
910 Consolidated Bonds and debentures.
912 Book-entry procedure for Federal Home Loan Bank Securities.
914 Hearings [Reserved].
916 Promulgation of regulations and amendments [Reserved].
918 Implementation of the Equal Access to Justice Act [Reserved].

Part
920 Use of penalty mail in the location and recovery of missing children [Reserved].
922 Employee Responsibilities and conduct [Reserved].
924 Practice before the Board of Directors [Reserved].

SUBCHAPTER B—FEDERAL HOME LOAN BANK SYSTEM

931 Definitions.
932 Organization of the Banks.
933 Members of the Banks.
934 Operations of the Banks.
935 Advances.
936 Advertising of accounts.
937 Housing opportunity allowance program.
938 Nondiscrimination requirements.
939 Nondiscrimination in federally assisted programs.
940 Statements of policy.
941 Rulings of the former Federal Home Loan Bank Board or the Board of Directors, Federal Housing Finance Board.
942 Electronic fund transfers.
943 Collection, settlement, and processing of payment instruments.
944 Prohibited consumer credit practices.

SUBCHAPTER C—FINANCING CORPORATION

950 Operations [Reserved].

SUBCHAPTER D—RESOLUTION FUNDING CORPORATION

955 Assessment of the Federal home loan banks for the Resolution Funding Corporation [Reserved].

2. Title 12 of the Code of Federal Regulations is amended by redesignating certain regulations from 12 CFR chapter V to 12 CFR chapter IX as set forth in the following redesignation table which shows the relationship of the former CFR part, subpart and section numbers under 12 CFR chapter V and new part, subpart and section numbers in 12 CFR chapter IX:

Redesignation Table

12 CFR ch. V Former Section Numbers	12 CFR ch. IX New Section Numbers
Part 506	Part 910
506.1	910.1
506.2	910.2

12 CFR Part 934

[No. FHFB 89-2]

Office of Thrift Supervision Assessments

Dated: August 28, 1989.

AGENCY: Federal Housing Finance Board.

ACTION: Final rule.

SUMMARY: To assist the Office of Thrift Supervision ("OTS") with its need to fund the costs of examining institutions under its jurisdiction, the Federal Housing Finance Board ("FHFB") hereby adopts a regulation pursuant to the Home Owners' Loan Act of 1933 ("HOLA"), as amended, requiring the Federal home loan banks to participate in OTS' payment mechanism. Because of the exigent circumstances of OTS being newly created and requiring funds to operate, the regulation is adopted effective September 5, 1989.

EFFECTIVE DATE: September 5, 1989.

FOR FURTHER INFORMATION CONTACT: Amy Maxwell, (202) 906-7865; James H. Gray, Attorney, (202) 906-6161, Federal Housing Finance Board Task Force.

SUPPLEMENTARY INFORMATION:

A. General

Section 9 of the HOLA as added by the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 ("FIRREA"), Public Law No. 101-73, section 301(9)(f), requires the Federal home loan banks ("banks") to collect fees and assessments from bank members regulated by OTS, by agreement and upon the request of the Director of OTS. 12 CFR 502, recently promulgated by OTS, requires all OTS regulated savings associations to establish demand deposit accounts at the bank in their district.

Pursuant to section 11(e)(1) of the Federal Home Loan Bank Act (12 U.S.C. 1431(e)(1)) the banks are authorized to take in deposits of instrumentalities of the United States: a term which encompasses the OTS. Moreover, 12 U.S.C. 1701c(c)(1), as amended by section 306(b) of Pub. L. 101-73, authorizes the Director of OTS to utilize the services of any Federal instrumentality (which term includes the banks) with the consent of the instrumentality. By the promulgation of this regulation, the FHFB requires that the banks perform this service on behalf of OTS and accept the deposits of OTS funds for the purposes described in this regulation.

The banks may choose to require their affected members to enter agreements with the bank to clarify the charge and the ministerial nature of the bank's role in this agreement process. FHFB assumes that determination of the proper dates and amounts of the assessments are to be agreed upon by OTS and the savings associations. The bank's sole responsibility will be a ministerial one of acting as collecting agent. As specifically provided in the HOLA, the banks will expect to the reimbursed for the actual cost of collection. Those bank members who are not regulated by the OTS are not affected by this regulation.

B. Administrative Procedure Act

The FHFB is adopting this regulation as a final rule effective immediately, without the usual notice and comment period or delayed effective date provided for in the Administrative Procedure Act, 5 U.S.C. 553. Those requirements may be waived for "good cause." 5 U.S.C. 553(b)(3)(B), 553(d)(3). The FHFB finds that good cause exists because of the urgent necessity of establishing a mechanism to meet the OTS' immediate funding needs following its establishment by enactment of the FIRREA. Similarly, providing notice and comment procedures and a delayed effective date would be contrary to the public interest because OTS could not immediately discharge its statutory responsibilities.

C. Regulatory Flexibility Act

Because no notice of proposed rulemaking is required for this regulation, the provisions of the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) do not apply.

List of Subjects in 12 CFR Part 934

Assessments, Federal home loan banks, Examinations, Securities, Surety bonds.

Accordingly, the Federal Housing Finance Board hereby amends part 934 of subchapter B, chapter IX, title 12, Code of Federal Regulations, as set forth below.

SUBCHAPTER B—FEDERAL HOME LOAN BANK SYSTEM

PART 934—OPERATIONS OF THE BANKS

1. The authority citation for part 934 is revised to read as follows:

Authority: Sec. 9, as added by sec. 301, 103 Stat. 316 (12 U.S.C. 1467); sec. 10, as added by sec. 301, 103 Stat. 318 (12 U.S.C. 1467a); sec. 12, as added by sec. 310, 103 Stat. 343 (12 U.S.C. 1468a).

2. Section 934.14 is added to read as follows:

§ 934.14 Office of Thrift Supervision assessments.

At the request of, and in accordance with the instructions of, the Director of the Office of Thrift Supervision, the Federal home loan banks shall remit funds made available by their members to satisfy Office of Thrift Supervision assessments.

By the Federal Housing Finance Board.

Jack Kemp,

Acting Chairperson.

BILLING CODE 6720-01-M

SMALL BUSINESS ADMINISTRATION

13 CFR Part 122

RIN 3245-AB98

Business Loans for 8(a) Program Participants

AGENCY: Small Business Administration.

ACTION: Final rule.

SUMMARY: Section 302 of the "Business Opportunity Development Reform Act of 1988," Public Law 100-656 (102 Stat. 3853), enacted November 15, 1988 (1988 legislation), provides a statutory basis for a program of direct, guaranteed and immediate participation financial assistance for small businesses which are participants in the Small Business Administration's (SBA) section 8(a) program and which are presently eligible to receive contracts under that program. This final rule implements the 1988 legislation.

EFFECTIVE DATE: June 1, 1989.

FOR FURTHER INFORMATION CONTACT: Charles R. Hertzberg, Deputy Associate Administrator for Finance and Investment, Small Business Administration, 1441 L Street NW., Washington, DC 20416, telephone (202) 653-6574.

SUPPLEMENTARY INFORMATION: On June 13, 1989, SBA published proposed regulations in the **Federal Register** (54

FR 25128) to implement the 1988 legislation. Public Law 101-37, enacted June 15, 1989 (103 Stat. 70) changed the effective date of this program from October 1, 1989 to June 1, 1989. Four comments were received. One commenter noted that the regulation as proposed did not make clear whether SBA would assist debt refinancing under this program. It is the SBA position that debt refinancing or refunding is not available under this program and the final regulation makes that clear. Neither is SBA assistance available under this program for the payment of taxes. The program is to provide section 7(a) aid to section 8(a) businesses which are eligible to receive contracts at the time that the section 7(a) assistance is sought.

Two of the commenters suggested that SBA increase the administrative limit on direct loans from $150,000 to $500,000. SBA is capping the amount at $150,000 to conform to other section 7(a) lending and to allow the appropriation levels to assist more eligible applicants. In any event, SBA has the authority to increase the $150,000 to up to $750,000 on a case-by-case basis.

The third commenter was of the opinion that more centralized processing of applications in this program would eliminate the possibility of favoritism. Over the years, SBA has decentralized its loan processing procedures. The oversight responsibilities in the various offices preclude, to a very large degree, the possibility of favoritism. In the final regulation, SBA has reserved to its Central Office the authority to increase the administrative limits, but except for that, the Administration has determined that decentralized processing works best.

One of the commenters discussed the importance of subordinating SBA's loans to facilitate a company's additional financing. The final regulation authorizes SBA to subordinate on a case-by-case basis based upon reasonable credit criteria but SBA will take a security interest in the items financed. The commenter was of the opinion that shorter term maturities should be utilized. SBA establishes maturity on an as-needed basis. The 25 year maturity stated in the final regulation is the maximum permissible period and will not be utilized in every case. The commenter also suggested that SBA be flexible in repayment scheduling, with a specific reference to the allowance of balloon payments. SBA has flexibility presently to structure repayment schedules, although use of balloons is very limited.

Section 122.7-1 as amended provides for a $150,000 administrative limit for direct loans made under this program, but the Associate Administrator for Minority Small Business and Capital Ownership Development has the authority to increase that up to $750,000.

Section 122.59-1 sets forth the statutory policy behind this program. In this regard, it is to be available to participants in the program which are eligible to receive 8(a) contracts at the time the financial assistance is sought. The assistance is to be available on much the same terms as SBA's other financial assistance is made available to small businesses. (§ 122.59-2). Under the legislation, if loan proceeds are to be used for working capital, the recipient must be a manufacturer. If loan proceeds are to be used for plant construction, conversion, or expansion (including the acquisition of equipment, facilities, machinery, supplies, or material), the recipient may be either a manufacturer or a nonmanufacturer. It is acknowledged by SBA that to the extent possible, without compromising the integrity of the program, criteria applied to this special loan program will recognize the economically disadvantaged nature of the applicants. However, in no event shall debt refinancing or refunding be available under this program, nor shall loan proceeds be used for the payment of taxes.

With respect to guaranteed loans made under this program, SBA shall guaranty no less than 90 percent of the principal balance at the time the loan is made of loans of a principal amount of not more than $155,000 and no less than 85 percent of loans of a principal amount of more than $155,000. The rate of interest on such loans is calculated in the same way that it is calculated for SBA guaranteed business loans for small businesses. (See § 122.59-3.)

A direct loan note generated under this program is subordinated by SBA to all past borrowings of the borrower from banks and other financial institutions, but not individuals. SBA will consider subordination to future borrowings on a case-by-case basis using normal credit criteria. (§ 122.59-4(b)(1)). The interest rate on direct loans made under this authority is 1 percent less than direct loans made in the regular business loan program. (§ 122.59-4(b)(2)). There is an administrative ceiling of $150,000 on direct loans which may be waived upon the recommendation of the Associate Administrator for Minority Small Business and Capital Ownership Development for good cause shown, on a case-by-case basis. (§ 122.59-4(b)(5)).

For purposes of the Regulatory Flexibility Act (5 U.S.C. 605(b)), SBA certifies that this final rule will not have a significant impact on a substantial number of small entities. SBA's best estimates indicate that approximately 20 to 40 loans per year will be made under this authority.

SBA certifies that this final rule does not constitute a major rule for the purposes of Executive Order 12291, since the change is not likely to result in an annual effect on the economy of $100 million or more because it is anticipated that no more than $10,000,000 will be appropriated for this program in a given fiscal year.

The final rule would not impose additional reporting or recordkeeping requirements which would be subject to the Paperwork Reduction Act, 44 U.S.C. chapter 35.

This final rule would not have federalism implications warranting the preparation of a Federal Assessment in accordance with Executive Order 12612.

List of Subjects in 13 CFR Part 122

Business loans.

Pursuant to the authority contained in section 5(b)(6) of the Small Business Act (15 U.S.C. 634(b)(6)) and section 302 of Public Law 100-656, SBA hereby amends part 122, chapter I, title 13, Code of Federal Regulations, as follows:

PART 122—[AMENDED]

1. The authority citation for part 122 continues to read as follows:

Authority: 15 W.S.C. 634(b)(6) and 636(a).

2. Section 122.7-1 is revised to read as follows:

§ 122.7-1 Direct loans.

The statutory limit for direct loans made under the authority of section 7(a)(1)-(19) of the Small Business Act is $350,000. SBA has established an administrative limit of $150,000. The statutory limit for direct loans made under the authority of section 7(a)(20) is $750,000. SBA has established an administrative limit of $150,000; however, the Associate Administrator for Minority Small Business and Capital Ownership Development may authorize in writing the acceptance of an application up to $750,000 that exceeds the administrative but not the statutory limit.

3. New §§ 122.59, 122.59-1, 122.59-2, 122.59-3, and 122.59-4 are added to subpart B to read as follows:

§ 122.59 Loans to participants in the 8(a) program.

§ 122.59-1 Policy.

The Act authorizes the Administration to make loans either directly or in cooperation with banks or other financial institutions through agreements to participate on an immediate or deferred (guaranteed) basis to small business concerns receiving assistance under subsection 7(j)(10) and section 8(a) of the Act; i.e., firms which are presently participating in the section 8(a) program and are eligible for contractual assistance under section 8(a) of the Act; and not firms which may be eligible to apply for the program.

§ 122.59–2 Conditions.

(a) Any assistance provided under this section may be provided only if the Administration determines that—

(1) The type and amount of such assistance requested by such concern is not otherwise available on reasonable terms from other sources. Every applicant for a direct loan, immediate participation of guaranty loan must show that the loan is not available without SBA assistance. In addition, an applicant for a direct loan must show that neither an immediate participation nor a guaranty loan is available; an applicant for an immediate participation must show that a guaranty loan is not available;

(2) With such assistance such concern has a reasonable prospect for operating soundly and profitably within a reasonable period of time;

(3) The proceeds of such assistance will be used within a reasonable time for plant construction, conversion, or expansion, including the acquisition of equipment, facilities, machinery, supplies, or material or to supply such concern with working capital to be used in the manufacture of articles, equipment, supplies, or material for defense or civilian production or as may be necessary to insure a well-balanced national economy; and

(4) Such assistance is of such sound value as reasonably to assure that the terms under which it is provided will not be breached by the small business concern. No financial assistance shall be extended under this section unless there is reasonable assurance that the loan can be paid from the earnings of the business.

(b) No loan shall be made under this authority if the total amount outstanding and committed (by participation or otherwise) to the borrower would exceed $750,000.

(c) In no event shall debt refinancing or refunding be made by the Administration under this program.

§ 122.59–3 Conditions applicable to deferred participation assistance (guaranteed).

(a) Subject to the provisions of § 122.59–2(b), in agreements to participate in loans on a deferred (guaranteed) basis, participation by the Administration shall be no less than 90 per centum of the balance of the financing outstanding at the time of disbursement of loans of a principal amount does not exceed $155,000 and no less than 85 per centum of loans of a principal amount of more than $155,000.

(b) The rate of interest on financings made on a deferred (guaranteed) basis shall be legal and reasonable, and shall be calculated in accord with §§ 122.8–3 and 122.8–4 of this title.

§ 122.59–4 Conditions applicable to immediate participation and direct assistance.

(a) All immediate participation and direct financings made pursuant to this section shall be subject to the applicable provisions of this title and the following limitations:

(1) No immediate participation may be purchased unless it is shown that a deferred participation is not available.

(2) No direct financing may be made unless it is shown that a participation is unavailable.

(b) A direct loan or the Administration's share of an immediate participation loan made pursuant to this section shall be accomplished by the issuance of a secured debt instrument—

(1) That is subordinated by its terms to all other borrowings of the issuer from banks or other financial institutions which are in existence at the time that the SBA assistance is made. SBA will consider subordination of assistance it makes available under this subsection to subsequent borrowings on a case-by-case basis based upon reasonable credit criteria;

(2) The rate of interest on which shall be the same as that calculated pursuant to § 122.8–1 of this title, less one per centum;

(3) The term of which is not more than twenty-five years;

(4) The principal on which is amortized at such rate as may be deemed appropriate by the Administration, and the interest on which is payable not less often than annually.

(5) The maximum principal amount of which may be no more than $150,000; however, the Associate Administrator for Minority Small Business and Capital Ownership Development may authorize, in writing, the acceptance of an application that exceeds $150,000 but does not exceed $750,000.

Dated: August 23, 1989.

Susan Engeleiter,

Administrator.

Food and Drug Administration

21 CFR Part 341

[Docket No. 76N–052G]

RIN 0905–AA06

Cold, Cough, Allergy, Bronchodilator, and Antiasthmatic Combination Drug Products Containing Promethazine Hydrochloride; Marketing Status; Policy Statement

AGENCY: Food and Drug Administration.

ACTION: Policy statement.

SUMMARY: The Food and Drug Administration (FDA) is announcing that cold, cough, allergy, bronchodilator, and antiasthmatic combination drug products containing promethazine hydrochloride may not be marketed over-the-counter (OTC) at this time. Such products may continue to be dispensed on prescription or administered by licensed practitioners, in accordance with approved new drug applications (NDA). This announcement is made in accordance with FDA's enforcement policy applicable to prescription drugs undergoing review in the OTC drug review (see 21 CFR 330.13(b)(2)). This policy statement is part of the ongoing review of OTC drug products conducted by FDA.

EFFECTIVE DATE: This policy statement is effective September 5, 1989.

FOR FURTHER INFORMATION CONTACT: William E. Gilbertson, Center for Drug Evaluation and Research (HFD–210), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301–295–8000.

SUPPLEMENTARY INFORMATION: In the **Federal Register** of September 9, 1976 (41 FR 38312), FDA published, under § 330.10(a)(6) (21 CFR 330.10(a)(6)), an advance notice of proposed rulemaking to establish a monograph for OTC cold, cough, allergy, bronchodilator, and antiasthmatic drug products, together with the recommendations of the Advisory Review Panel on OTC Cold, Cough, Allergy, Bronchodilator, and Antiasthmatic Drug Products (Cough-Cold Panel), which was the advisory review panel responsible for evaluating data on the active ingredients in these

drug classes. The Cough-Cold Panel recommended OTC marketing, in oral dosage forms with specific labeling (41 FR 38312 at 38390, 38391, 38418 to 38421, and 38423), of certain drug products containing promethazine hydrochloride that were previously marketed as prescription drug products. However, at that time, the agency did not agree with the Panel's recommendation to switch this drug to OTC marketing status (41 FR 38313) and products containing this ingredient could not then, under 21 CFR 330.13, be marketed OTC under the OTC drug review.

The enforcement policy set out in 21 CFR 330.13 permits OTC marketing, prior to the establishment of a final monograph, of drugs previously limited to prescription use only when certain conditions are met. In general, such drugs can only be marketed OTC either when FDA agrees with an advisory review panel or when FDA independently decides that such OTC marketing is appropriate and publishes a notice in the **Federal Register**. Even then, as stated in the enforcement policy, such drug products are marketed subject to the risk that the agency may later adopt a different position that would preclude OTC marketing.

The agency's proposed regulation, in the form of a tentative final monograph, for OTC cold, cough, allergy, bronchodilator, and antiasthmatic combination drug products was published in the **Federal Register** of August 12, 1988 (53 FR 30522). Publication of the tentative final monograph allowed OTC marketing of combination drug products containing promethazine, for certain indications and under specified conditions, under the terms of 21 CFR 330.13. To date, the agency is not aware of any OTC marketing of such products.

Interested persons were invited to file by December 12, 1988, written comments, objections, or requests for oral hearing before the Commissioner of Food and Drugs regarding the proposal. New data could be submitted until August 14, 1989, and comments on the new data can be submitted until October 12, 1989.

In response to the proposed rule on OTC cold, cough, allergy, bronchodilator, and antiasthmatic combination drug products, one manufacturer and seven health professionals submitted comments related to promethazine hydrochloride. Also, one consumer's group submitted a citizen petition. In addition, FDA's Pulmonary-Allergy Drugs Advisory Committee discussed the issue of OTC marketing of cough-cold combination drug products containing promethazine hydrochloride in a public meeting held on July 31, 1989. Copies of the comments, the citizen petition, and the transcripts of the advisory committee's meeting are on public display in the Dockets Management Branch, Rm. 4–62, 5600 Fishers Lane, Rockville, MD 20857, between 9 a.m. and 4 p.m., Monday through Friday. Any additional information that has come to the agency's attention since publication of the proposed rule is also on public display in the Dockets Management Branch.

FDA is now announcing that cold, cough, allergy, bronchodilator, and antiasthmatic combination drug products containing promethazine hydrochloride may not be marketed OTC at this time in order to allow the agency to consider thoroughly all of the additional data and information that have been submitted on the safety of OTC marketing of these drug products. Therefore, under 21 CFR 330.13, OTC marketing of such products under the OTC drug review is no longer being permitted at this time.

I. Background

The Cough-Cold Panel classified promethazine hydrochloride in Category I as an OTC antihistamine (41 FR 38312 at 38390 and 38391). The agency dissented from the Panel's Category I classification of promethazine hydrochloride in the preamble to the Panel's report (41 FR 38312 and 38313). The agency's dissent was based in part on the degree of drowsiness produced by promethazine hydrochloride and the possible adverse effects that might occur, especially in children, such as extrapyramidal disturbances.

In the tentative final monograph (proposed rule) for OTC antihistamine drug products (50 FR 2200 at 2206 to 2208; January 15, 1985), the agency stated that the possibility of choreoathetosis (a condition marked by jerky, involuntary movements) occurring with OTC oral doses of promethazine is unlikely. This conclusion was supported by a review of FDA adverse reaction data for the period 1970–1981 and a review of the published literature. These sources revealed only a few cases of extrapyramidal effects possibly associated with dosages of promethazine that would be available OTC. Also, there was no evidence to indicate that these effects would be more likely to occur in children. Based upon the available data, the agency stated that concerns regarding the occurrence of extrapyramidal effects and choreoathetosis and the concern that children seem particularly liable to develop adverse central nervous system reactions to promethazine had been adequately addressed. Thus, in FDA's view, at that time these possible adverse effects were no longer considered issued that would preclude use of this ingredient at proposed OTC oral dosages.

However, the agency placed promethazine hydrochloride in single-ingredient drug products in Category III in the proposed rule for OTC antihistamine drug products because of concerns that the rare, but serious adverse reaction of the central nervous system known as tardive dyskinesia might occur if promethazine hydrochloride is used on a long-term basis (50 FR 2206 to 2208). (Placement in Category III at that time meant that there was insufficient evidence to determine whether the drug was generally recognized as safe and effective for OTC use.) The agency noted that promethazine hydrochloride has not been used extensively on a long-term basis as a single ingredient for antihistamine/allergic rhinitis/antiallergy use and that consumers who use OTC antihistamines to treat the symptoms of allergic rhinitis often use these products on a long-term basis because the symptoms of allergic rhinitis usually occur for extended periods of time. The agency also noted that promethazine hydrochloride as a prescription drug is used primarily in combination drug products for relief of acute cough-cold symptoms on a short-term basis.

Subsequently, in the tentative final monograph (proposed rule) for OTC cold, cough, allergy, bronchodilator, and antiasthmatic combination drug products (53 FR 30522 at 30558 to 30559 and 30563; August 12, 1988, and 53 FR 45774; November 14, 1988), the agency proposed that cough-cold combination drug products containing promethazine hydrochloride be Category I for short-term use (7 days) only for relief of symptoms of the common cold. By this action, OTC marketing for this limited use was permitted at that time under 21 CFR 330.13. Claims for use of these drug products in treating the symptoms of allergic rhinitis were specifically excluded from the labeling (53 FR 30559).

In response to this tentative final monograph, the agency received a citizen petition from Public Citizen Health Research Group and the University of Maryland Sudden Infant Death Syndrome (SIDS) Institute (Ref. 1), a letter from Public Citizen Health Research Group (Ref. 2), and comments from several physicians (Ref. 3) objecting to the agency's proposal

BEST COPY AVAILABLE

allowing limited OTC marketing of drug products containing promethazine hydrochloride.

The citizen petition requested an immediate ban on all OTC use of products containing promethazine hydrochloride; a contraindication of prescription promethazine hydrochloride use in children under the age of 2 years, or in pregnant or lactating females; strengthening of the physician labeling provisions to include a bold, prominent, boxed warning stating "This product contains promethazine hydrochloride, a drug which should not be used by children under the age of 2 years, or by pregnant or breast feeding women because safety is not established in these patients, and because promethazine is associated with SIDS and infant respiratory depression"; addition of a mandatory patient package insert stating that a modified dosage schedule should be used in elderly patients, and that the product should not be used in children under the age of 2 years, or by pregnant or breast feeding women; modification of the new drug application for promethazine hydrochloride-containing drug products to prohibit promethazine use as an antihistamine in prescription cold-cough analgesic-antipyretic compounds; and removal from prescription availability of promethazine-containing products marketed specifically for this antihistamine use.

The major concern that the petition and the letters from physicians raise is that there is a possibility that the use of drug products containing promethazine hydrochloride in children under 2 years of age may be associated with the occurrence of SIDS, and that OTC availability of these drug products could "dramatically increase" "overuse" of these drug products in children this age. In addition, the petition raised concerns about possible adverse neurological reactions to drug products containing promethazine hydrochloride. The petition also raised concerns regarding the use on a prescription basis of promethazine-containing drug products in children under age 2, in pregnant or nursing women, and in the elderly.

One manufacturer of combination drug products containing promethazine hydrochloride has submitted data and information to the agency (Ref. 4) in response to the concerns raised in the citizen petition and has objected to the requests in the petition. In addition, the agency has received other information concerning OTC use in Canada of drug products containing promethazine hydrochloride (Ref. 5).

In response to the citizen petition and the manufacturer's submission, FDA scheduled a meeting of its Pulmonary-Allergy Drugs Advisory Committee to further discuss the advisability of switching the marketing of cough-cold combination drug products containing promethazine hydrochloride from a prescription basis to an OTC basis. The advisory committee met on July 31, 1989. Presentations were made by FDA staff and consultants, by representatives of Public Citizen Health Research Group, and by representatives of Wyeth-Ayerst. Following these presentations, the advisory committee deliberated on several questions concerning OTC status for cough-cold combination drug products containing promethazine hydrochloride.

In response to one question concerning the relationship between the use of promethazine-containing drug products and SIDS and/or sleep apnea, one committee member voted that no relationship exists while the other seven members voted that there is a possible relationship. In response to a question concerning whether there is reason for concern about the use in the elderly of the proposed OTC adult oral dosage of promethazine hydrochloride (6.25 mg every 4 to 6 hours, not to exceed 37.5 mg in 24 hours) on a short-term (7-day) basis, four committee members voted yes and four members voted no. With respect to potential neurologic toxicities at the proposed OTC dosage, none of the committee members felt there was a definite concern, but all voted that there are possible concerns. In response to a question concerning whether (based on the data presented to the committee) a cough-cold combination drug product containing promethazine hydrochloride at proposed OTC doses with specific labeling requirements for short-term (7-day) use should be marketed OTC for relief of the symptoms of the common cold, the committee recommended to FDA by a vote of seven to one that these drug products not be marketed OTC at this time.

FDA has concluded that it should accept the advisory committee's advice and is limiting cough-cold combination drug products containing promethazine hydrochloride to prescription only status at this time. Before making a final decision concerning OTC status for these products and before responding to the various requests in the citizen petition (see discussion above), the agency intends to fully and thoroughly evaluate the data and information submitted to date, the data and information presented at the July 31, 1989 advisory committee meeting, and other data and information that may be pertinent.

FDA is aware that there is some controversy in the scientific and medical communities concerning whether a cause-and-effect relationship exists between use of promethazine hydrochloride containing drug products and the occurrence of SIDS and/or sleep apnea. There are also differences of opinion whether a modified dosage schedule should be used in elderly patients and on the extent of concern about possible neurologic toxicity resulting from the use of promethazine hydrochloride at proposed OTC dosages. The agency intends to reopen the administrative record for the rulemaking for OTC cold, cough, allergy, bronchodilator, and antiasthmatic combination drug products to allow additional information to be submitted on these and related subjects. A notice will appear in a future issue of the **Federal Register**. A final decision on the OTC marketing status of combination drug products containing promethazine hydrochloride will also appear in a future issue of the **Federal Register**.

(3) Comments No. C000201, C000205, C000207, C000208, C000209, C000210, and C000212, Docket No. 76N-052G, Dockets Management Branch.

(4) Comments No. RC0001 and RC0002, Docket No. 76N-052G, Dockets Management Branch.

(5) Comments No. LET088 and LET089, Docket No. 76N-052G, Dockets Management Branch.

II. Compliance

Drug products' containing promethazine hydrochloride were limited on or after May 11, 1972 (the date of the initiation of the OTC drug review), to prescription use for the indications and routes of administration considered by the OTC Cough-Cold Panel. As stated above, these products could only be marketed OTC after the date of publication in the **Federal Register** of the tentative final monograph (proposed rule) for OTC cold, cough, allergy, bronchodilator, and antiasthmatic combination drug products (53 FR 30522; August 12, 1988). Under 21 CFR 330.13(b)(2), OTC drug products containing promethazine hydrochloride that are marketed after the date of publication in the **Federal Register** of a tentative final monograph (proposed rule) but prior to the effective date of a final monograph, are

* * * subject to the risk that the Commissioner may not accept the Panel's recommendation and may instead adopt a different position that may require relabeling, recall, or other regulatory action. The Commissioner may state such position at any time by notice in the **Federal Register**, either separately or as part of another document; appropriate regulatory action will commence immediately and will not await publication of a final monograph. Marketing of such a product with a formulation or labeling not in accord with a proposed monograph or tentative final monograph also may result in regulatory action against the product, the marketer, or both.

Under this enforcement policy, the agency can stop OTC marketing of a drug while the agency reviews and evaluates relevant data and information. By this notice, all combination drug products containing promethazine hydrochloride are prescription drugs and may only be marketed in accordance with the terms and conditions specified in their approved NDA. Accordingly, the agency would consider as misbranded under section 502 of the Federal Food, Drug, and Cosmetic Act (the act) (21 U.S.C. 352) and a new drug under section 201(p) of the act (21 U.S.C. 321(p)), any combination drug product containing promethazine hydrochloride that is marketed OTC at this time.

The agency is not currently aware of any combination drug product containing promethazine hydrochloride having been marketed OTC to date. However, any combination drug product containing promethazine hydrochloride that has already been initially introduced or initially delivered for introduction into interstate commerce must be immediately removed from OTC sale. Manufacturers of any such products should contact the agency immediately to discuss how removal of their products will be accomplished (i.e., removed from retail shelves, placed under the control of pharmacists, and dispensed only on prescription). Affected manufacturers should contact the Division of Drug Labeling Compliance (HFD-310), Center for Drug Evaluation and Research, Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, phone 301-295-8063.

Dated: August 28, 1989.

Frank E. Young,

Commissioner of Food and Drugs.

BILLING CODE 4160-01-M

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

Office of the Secretary

24 CFR Parts 200 and 206

[Docket No. R-89-1415; FR-2481]

RIN 2501-AA67

Home Equity Conversion Mortgage Insurance; Corrections

AGENCY: Office of the Secretary, HUD.

ACTION: Final rule, corrections.

SUMMARY: The purpose of this document is to clarify a technical correction published in the **Federal Register** on August 4, 1989 (54 FR 32059), that corrected a final rule which authorized the Secretary to carry out a program for insuring mortgages on the homes of elderly homeowners, by enabling the homeowners to convert the equity in their homes into cash. It will also correct a typographical error published in that correction document.

FOR FURTHER INFORMATION CONTACT: Judith V. May, Office of Economic Affairs, Room 8218, Department of Housing and Urban Development, 451 Seventh Street SW., Washington, DC 20410. 202-755-5426. (This is not a toll-free number.)

SUPPLEMENTARY INFORMATION: On June 9, 1989 (54 FR 24822), the Department published a final rule that added a new part 206 to title 24, chapter II of the Code of Federal Regulations. Part 206 implemented section 417 of the Housing and Community Development Act of 1987 (Pub. L. 100-242), which added a new section 255 to the National Housing Act (Act). Section 255 authorized the Secretary to carry out a program for insuring mortgages on the homes of elderly homeowners, enabling the homeowners to convert the equity in their homes to cash.

On August 4, 1989 (54 FR 32059), the Department published technical corrections to that final rule. This document will clarify the correction for § 206.23(d) that was published on August 4, 1989.

Accordingly, the following corrections are made in FR Doc. 89-13639, to 24 CFR parts 200 and 206, published in the **Federal Register** issue dated June 9, 1989 (54 FR 24822), as corrected in FR Doc. 89-18252, published in the **Federal Register** issue dated August 4, 1989 (54 FR 32059):

§ 206.21 [Corrected]

1. In § 206.21(d), in the introductory text only, on page 24835, as corrected on page 32060, correct by removing the words "interest rate" and inserting in their place, "mortgage balance".

§ 206.23 [Corrected]

2. In § 206.23(d), on page 24835, as corrected on page 32060, correct the word "mortgage" the last time it appears, to read "mortgagee".

Dated: August 29, 1989.

Grady J. Norris,

Assistant General Counsel for Regulations.

[FR Doc. 89-20754 Filed 9-1-89; 8:45 am]

BILLING CODE 4210-32-M

DEPARTMENT OF LABOR

Occupational Safety and Health Administration

29 CFR Part 1910

RIN 1218-AB26

Air Contaminants

AGENCY: Occupational Safety and Health Administration, Labor.

ACTION: Final rule; Grant of petitions for reconsideration of three exposure limits and partial stays of effective dates for four substances.

SUMMARY: OSHA reduced exposure limits for 375 air contaminants on January 19, 1989 at 54 FR 2332. OSHA is granting a petition for reconsideration of the Short Term Exposure Limit (STEL)) for acetone of 1000 ppm for the cellulose acetate fiber industry and it is not in effect for that industry. The STEL remains in effect for all other industries except the cellulose acetate fiber industry. The Time Weighted Average (TWA) of 750 ppm for acetone is stayed until September 1, 1990 for one operation in the cellulose acetate fiber industry.

OSHA is also granting a petition for reconsideration of the new limit of 5 mg/m^3 for calcium hydroxide and it is not in effect. The prior limit of 5 mg/m^3 respirable dust and 15 mg/m^3 total dust as a particulate not otherwise regulated remains in effect. OSHA will also reconsider the limit of 5 mg/m^3 for calcium oxide but the prior limit which was also 5 mg/m^3 will remain in effect.

A stay of the ceiling limit for carbon monoxide is granted for three operations in the steel industry. A stay of the new limits for nitroglycerin and ethylene glycol dinitrate is granted to the explosives industry until October 1, 1989. A stay until October 1, 1989 is granted to the drycleaning industry for the new limit for perchloroethylene.

DATE: These actions take effect on September 1, 1989.

FOR FURTHER INFORMATION CONTACT: Mr. James F. Foster, OSHA Office of Public Affairs, Room N–3647, Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210, Telephone (202) 523–8151.

SUPPLEMENTARY INFORMATION: On January 19, 1989 at 54 FR 2332 OSHA issued a final standard setting new or more protective exposure limits for 375 substances. The new limits are to be achieved with any reasonable combination of controls including engineering controls and respirators by September 1, 1989, and with a preference for engineering controls by December 31, 1992. Individual companies or trade associations representing industry brought 28 law suits challenging approximately 15 of these new limits. The AFL–CIO also challenged a number of exposure limits as not sufficiently protective.

The objective of this regulatory effort is to create major improvements in occupational health by lowering exposures of 4.5 million workers to many toxic substances. OSHA concludes that the commitments obtained from industry as part of the settlements of individual law suits described in this notice will lead to improved health protection to workers, or will maintain protection while resolving complex legal issues or leading to the resolution of complex technical issues, consistent with statutory requirements.

1. Acetone

In the case of acetone, OSHA lowered exposures from a 1000 ppm 8 hour TWA to a 750 ppm TWA and issued a new 1000 ppm STEL. The cellulose acetate fiber industry consisting of two companies, Tennessee Eastman and Hoechst Celanese, petitioned the Court of Appeals to review the standard challenging both the health need for the STEL, and the feasibility of the STEL for their industry only. They are challenged the practicality of respirator use in some areas and administratively petitioned OSHA to reconsider the STEL.

OSHA reviewed the information submitted and continues to conclude there is a health need for the STEL to prevent moderate irritation and that it is generally feasible. OSHA carefully reviewed feasibility of the STEL for this sector.

Based upon its review the cellulose acetate fiber industry's agreement to under take certain specific measures to protect the health of its employees, OSHA agreed to settle the law suit challenging the acetone standard. The Amalgamated Clothing and Textile Workers Union, which represents workers in that industry, supported the settlement agreement.

The settlement agreement is available in the OSHA Docket Office (Room N–2625 at the above address, (202) 523–7894, Ex. No. 221–67 in Docket H–020). It provides that the two companies and three plants which make up the entire industry will commence now on a schedule over the next three years to install an extensive series of engineering controls to reduce employee exposure to acetone. OSHA believes these controls will generally succeed in bringing employee exposures below the 1000 ppm STEL.

In addition the companies will install airline respirators at locations where they are needed and feasible. The companies will also maintain a medical program and transfer workers who demonstrate irritation to lower exposure areas. The petitioners have withdrawn their law suit.

OSHA concludes, in light of this extensive worker protection program and the additional feasibility data it will provide, to grant the petition for reconsideration of the STEL only for the cellulose acetate fiber industry while the industry is installing these extensive controls. As a result the decision on the STEL is no longer final for the industry and it is not in effect for this industry. When the program is complete, but no later than June 30, 1993, OSHA will commence reviewing its results and issue a new final rule regarding the STEL for acetone in this industry after an opportunity for notice and comment. The final decision will be subject to judicial review under section 6(f) of the Act. OSHA concludes that this will result in better protection for workers in the industry than continuing with lengthy and complex litigation. The STEL remains in effect for all other industries.

In addition, OSHA pursuant to the settlement agreement, is also authorizing a stay of enforcement until September 1, 1990 of the start-up date of the new TWA for a limited group of workers, certain "doffers," in this sector in limited circumstances. Doffers are those workers who remove and transport bobbins containing cellulose acetate thread after it emerges from the fiber extrusion and spinning process. The employer will immediately commence installation of engineering controls necessary to achieve compliance and not wait to complete them by the December 31, 1992 date which would be permitted by the regulation.

2. Calcium Oxide and Calcium Hydroxide

OSHA's prior limit for calcium oxide was 5 mg/m^3. The final air contaminant standard retained the preexisting 5 mg/m^3 standard for calcium oxide.

Calcium hydroxide was not a listed air contaminant. It was regulated as a nuisance dust (particulate not otherwise regulated—PNOR) at 5 mg/m^3 respirable dust and 15 mg/m^3 total dust. The final rule set a 5 mg/m^3 limit for calcium hydroxide.

These two substances are irritants. Lime is the common name for calcium oxide and is sometimes used as the common name for a combination of the two.

The National Lime Association contended that the calcium oxide level should be raised to 10 mg/m^3 and that the calcium hydroxide level should be left at the PNOR level. It petitioned the Court of Appeals for review of the standard and filed a petition for reconsideration with OSHA.

OSHA has concluded that a major additional study on the health effects of calcium oxide and calcium hydroxide would be of considerable benefit in refining the exposure limit for these substances. Accordingly OSHA entered into a settlement agreement with the National Lime Association that provides for such a study. The settlement agreement, which OSHA believes will better protect employees than continuation of the litigation, is available in the Docket Office as Ex. 221–68.

Specifically, the National Lime Association has agreed to perform a study pursuant to a protocol reviewed by OSHA. That study has commenced and is intended to be completed by December 31, 1990. The Association has withdrawn its law suit.

OSHA concludes in light of the commencement of the study to grant the petition for reconsideration. As a result of this action the decision on the exposure limits for calcium hydroxide and calcium oxide in the Final Rule Limits column is no longer final and those exposure limits are no longer in effect.

Upon completion of the study and no later than the deadline date specified in the agreement or June 30, 1991, OSHA will commence reconsidering the exposure limits for calcium oxide and calcium hydroxide and reach final decisions. Comments will be requested in the Federal Register and judicial review will be available under section 6(f) of the Act of the final rule.

The Transitional Limits column of Table Z–1–A exposure limit of 5 mg/m^3 for calcium oxide remains in effect. It is the limit which is to be followed by employers and is to be achieved with the preference for engineering controls as specified in 29 CFR 1910.1000(e).

Also as a result of the reconsideration, calcium hydroxide remains regulated as a particulate not otherwise regulated (PNOR) at the exposure limit of 5 mg/m^3 respirable dust and 15 mg/m^3 total dust as specified in the Transitional Limits column. Employers are to limit employee exposure to calcium hydroxide to those levels following the methods of compliance specified in 29 CFR 1910.1000(e).

3. Additional Actions

The American Iron and Steel Institute petitioned OSHA to administratively stay the TWA and ceiling limits for carbon monoxide for the steel industry. For the reasons stated in OSHA's letter of July 17, 1989 available in the Docket Office as Ex. 221–65, OSHA has partially granted that stay. Specifically OSHA has stayed the September 1, 1989 start-up date of the ceiling limit for carbon monoxide for the steel industry (SIC 33) pending the outcome of litigation in the court of appeals for three operations only: blast furnaces, vessel blowing at basic oxygen furnaces and sinter plants.

The Institute of Makers of Explosives petitioned OSHA to administratively stay the new exposure limits for nitroglycerin and ethylene glycol dinitrate for the explosives industry. OSHA has stayed the September 1, 1989 start-up date of the Final Rule Limits column (new) exposure limits for those substances pending settlement negotiations until October 1, 1989. This is discussed in OSHA's letter of July 17, 1989, Ex. 221–64 in the Docket Office.

OSHA is staying the September 1, 1989 start-up date of the new 25 ppm TWA exposure limit for perchloroethylene for the drycleaning industry until October 1, 1989. OSHA has sent a letter of interpretation to the International Fabricare Institute indicating that air-purifying respirators may be used in certain circumstances. Ex. 221–69. This delay will permit a more orderly notification of the interpretation.

The following amendments to § 1910.1000 Table Z–1–A effectuate the above OSHA discussions and settlement agreements.

This document was prepared under the direction of Alan C. McMillan, Acting Assistant Secretary for Occupational Safety and Health, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210. It is issued pursuant to secion 6 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 655), section 4 of the Administrative Procedure Act, 5 U.S.C. 553, 29 CFR part 1911 and Secretary of Labor Order 9–83 (48 FR 35736).

Signed at Washington, DC this 29 day of August, 1989.

Alan C. McMillan,

Acting Assistant Secretary.

PART 1910—[AMENDED]

1. The authority citation for subpart Z of part 1910 continues to read in part as follows:

Authority: Secs. 6, 8 Occupational Safety and Health Act, 29 U.S.C. 655, 657; Secretary of Labor's Orders 12–71 (36 FR 8754), 8–76 (41 FR 25059), or 9–83 (48 FR 35736) as applicable; and 29 CFR part 1911.

All of subpart Z issued under section 6(b) of the Occupational Safety and Health Act, 29 U.S.C. 655(b) except those substances listed in the Final Rule Limits columns of Table Z–1–A, which have identical limits listed in the Transitional Limits columns of Table Z–1–A, Table Z–2 or Table Z–3. The latter were issued under section 6(a) (5 U.S.C. 655(a)).

Section 1910.1000, the Transitional Limits columns of Table Z–1–A, Table Z–2 and Table Z–3 also issued under 5 U.S.C. 553. Section 1910.1000, the transitional limits columns of Table Z–1–A, Table Z–2 and Table Z–3 not issued under 29 CFR part 1911 except for the arsenic, benzene, cotton dust, and formaldehyde listings.

§ 1910.1000 [Amended]

2. Section 1910.1000 is amended by adding a sentence at the end of paragraph (f)(2)(i) to read as follows: "(See Note at end of Table Z–1–A.)"

* * * * *

3. Section 1910.1000, Table Z–1–A is amended by revising the entries for acetone, calcium hydroxide and calcium oxide to include superscripts for footnotes and adding corresponding footnotes and a Note at the end of the Table to read as follows:

TABLE Z–1A.—LIMITS FOR AIR CONTAMINANTS

Substance	CAS No.	Transitional limits: PEL ppm	Transitional limits: PEL mg/m^3	Transitional limits: Skin Designation	Final rule limits: TWA ppm	Final rule limits: TWA mg/m^3	Final rule limits: STEL ppm	Final rule limits: STEL mg/m^3	Final rule limits: Ceiling ppm	Final rule limits: Ceiling mg/m^3	Skin designation
*	*	*		*	*		*		*		
Acetone[h]	67–64–1	1000	2400		750	1800	1000[h]	2400[h]			
*	*	*		*	*		*		*		
Calcium hydroxide[i]	1305–62–0					5[i]					
Calcium oxide[j]	1305–78–8		5			5[j]					
*	*	*		*	*		*		*		

* * * * * * *

[h] The acetone STEL does not apply to the cellulose acetate fiber industry. It is in effect for all other sectors.

[i] The Final Rule Limit of 5 mg/m^3 is not in effect as a result of reconsideration. Calcium hydroxide is covered by the exposure limits for particulates not otherwise regulated of 5 mg/m^3 respirable dust and 15 mg/m^3 total dust.

[j] The Final Rule Limit TWA of 5 mg/m^3 is not in effect as a result of reconsideration. The calcium oxide Transitional Limit of 5 mg/m^3 remains in effect and employee exposures shall be kept below that level pursuant to the methods of compliance specified in 29 CFR 1910.1000(e).

Note: Pursuant to administrative stays effective September 1, 1989 and published in the Federal Register on September 5, 1989, the September 1, 1989 start-up date specified in 29 CFR 1910.1000(f)(2)(i) is stayed as follows: until October 1, 1989 for nitroglycerin and ethylene glycol dinitrate in the explosives industry and perchloroethylene for the drycleaning industry; until September 1, 1990 for the acetone TWA for certain "doffers" in the cellulose acetate fiber industry; and until the decision on the merits of the Eleventh Circuit Court of Appeals in the case of *Courtaulds Fibers, Inc. v. U.S. Department of Labor*, No 89–7073 and consolidated cases, for the Ceiling for carbon monoxide for blast furnace operations, vessel blowing at basic oxygen furnaces and sinter plants in the steel industry (SIC 33). OSHA will publish in the **Federal Register** notice of the termination of the carbon monoxide stay.

[FR Doc. 89-20694 Filed 9-1-89; 8:45 am]

BILLING CODE 4510-26-M

FEDERAL EMERGENCY MANAGEMENT AGENCY

44 CFR Part 64

[Docket No. FEMA 6847]

Suspension of Community Eligibility; Nebraska, et al.

AGENCY: Federal Emergency Management Agency, FEMA.

ACTION: Final rule.

SUMMARY: This rule lists communities, where the sale of flood insurance has been authorized under the National Flood Insurance Program (NFIP), that are suspended on the effective date shown in this rule because of noncompliance with the revised floodplain management criteria of the NFIP. If FEMA receives documentation that the community has adopted the required revisions prior to the effective suspension date given in this rule, the community will not be suspended and the suspension will be withdrawn by publication in the **Federal Register**.

EFFECTIVE DATE: As shown in the fourth column.

FOR FURTHER INFORMATION CONTACT: Frank H. Thomas, Assistant Administrator, Office of Loss Reduction, Federal Insurance Administration, Federal Center Plaza, 500 C Street SW., Room 416, Washington, DC 20472, (202) 646-2717.

SUPPLEMENTARY INFORMATION: The NFIP enables property owners to purchase flood insurance at rates made reasonable through a Federal subsidy. In return, communities agree to adopt and administer local floodplain management measures aimed at protecting lives and new construction from future flooding. Section 1315 of the National Flood Insurance Act of 1968, as amended (42 U.S.C. 4022), prohibits flood insurance coverage as authorized under the NFIP (42 U.S.C. 4001-4128) unless an appropriate public body shall have adopted adequate floodplain management measures with effective enforcement measures.

On August 25, 1986, FEMA published a final rule in the **Federal Register** that revised the NFIP floodplain management criteria. The rule became effective on October 1, 1986. As a condition for continued eligibility in the NFIP, the criteria at 44 CFR 60.7 require communities to revise their floodplain management regulations to make them consistent with any revised NFIP regulation within 6 months of the effective date of that revision or be subject to suspension from participation in the NFIP.

The communities listed in this notice have not amended or adopted floodplain management regulations that incorporate the rule revision. Accordingly, the communities are not complaint with NFIP criteria and will be suspended on the effective date shown in this final rule. However, some of these communities may adopt and submit the required documentation of legally enforceable revised floodplain management regulations after this rule is published but prior to the actual suspension date. These communities will not be suspended and will continue their eligibility for the sale of insurance. A notice withdrawing the suspension of the communities will be published in the **Federal Register**. In the interim, if you wish to determine if a particular community was suspended on the suspension date, contact the appropriate FEMA Regional Office or the NFIP servicing contractor.

The Administrator finds that notice and public procedures und. : 5 U.S.C. 533(b) are impracticable and unnecessary because communities listed in this final rule have been adequately notified. Each community receives a 90- and 30-day notification addressed to the Chief Executive Officer that the community will be suspended unless the required floodplain management measures are met prior to the effective suspension date. For the same reasons, this final rule may take effect within less than 30 days.

Pursuant to the provision of 5 U.S.C. 605(b), the Administrator, Federal Insurance Administration, FEMA, hereby certifies that this rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As stated in section 2 of the Flood Disaster Protection Act of 1973, the establishment of local floodplain management together with the availability of flood insurance decreases the economic impact of future flood losses to both the particular community and the nation as a whole. This rule in and of itself does not have a significant economic impact. Any economic impact results from the community's decision not to adopt adequate floodplain management measures, thus placing itself in noncompliance with the Federal standards required for community participation.

List of Subjects in 44 CFR Part 64

Flood insurance and floodplains.

PART 64—[AMENDED]

1. The authority citation for part 64 continues to read as follows:

Authority: 42 U.S.C. 4001 et. seq., Reorganization Plan No. 3 of 1978, E.O. 12127.

2. Section 64.6 is amended by adding in alphabetical sequence new entries to the table.

§ 64.6 List of eligible communities.

State and community name	County	Community No.	Effective date
Nebraska: Amherst, village of	Buffalo	310245	Sept. 6, 1989.
North Dakota:

Harold T. Duryee,

Administrator, Federal Insurance Administration.

[FR Doc. 89-20756 Filed 9-1-89; 8:45 am]

BILLING CODE 6718-21-M

---

44 CFR Part 64

[Docket No. FEMA 6848]

Suspension of Community Eligibility; New York, et al.

AGENCY: Federal Emergency Management Agency, FEMA.

ACTION: Final rule.

SUMMARY: This rule lists communities, where the sale of flood insurance has been authorized under the National Flood Insurance Program (NFIP), that are suspended on the effective dates listed within this rule because of noncompliance with the floodplain management requirements of the program. If FEMA receives documentation that the community has adopted the required floodplain management measures prior to the effective suspension date given if this rule, the suspension will be withdrawn by publication in the **Federal Register**.

EFFECTIVE DATES: The third date ("Susp.") listed in the fourth column.

FOR FURTHER INFORMATION CONTACT: Frank H. Thomas, Assistant Administrator, Office of Loss Reduction, Federal Insurance Administration, (202) 646-2717, Federal Center Plaza, 500 C Street, Southwest, Room 417, Washington, DC 20472.

SUPPLEMENTARY INFORMATION: The National Flood Insurance Program (NFIP), enables property owners to purchase flood insurance at rates made reasonable through a Federal subsidy. In return, communities agree to adopt and administer local floodplain management aimed at protecting lives and new construction from future flooding. Section 1315 of the National Flood Insurance Act of 1968, as amended (42 U.S.C. 4022), prohibits flood insurance coverage as authorized under the National Flood Insurance Program (42 U.S.C. 4001-4128) unless an appropriate public body shall have adopted adequate floodplain management measures with effective enforcement measures. The communities listed in this notice no longer meet that statutory requirement for compliance with program regulations (44 CFR part 59 et seq.). Accordingly, the communities will be suspended on the effective date in the fourth column. As of that date, flood insurance will no longer be available in the community. However, some of these communities may adopt and submit the required documentation of legally enforceable floodplain management measures after this rule is published but prior to the actual suspension date. These communities will not be suspended and will continue their eligibility for the sale of insurance. A notice withdrawing the suspension of the communities will be published in the **Federal Register**. In the interim, if you wish to determine if a particular community was suspended on the suspension date, contact the appropriate FEMA Regional Office or the NFIP servicing contracter.

In addition, the Federal Emergency Management Agency has identified the special flood hazard areas in these communities by publishing a Flood Hazard Boundary Map. The date of the flood map if one has been published, is indicated in the fifth column of the table. No direct Federal financial assistance (except assistance pursuant to the Disaster Relief Act of 1974 not in connection with a flood) may legally be provided for construction or acquisition of buildings in the identified special flood hazard area of communities not participating in the NFIP and identified for more than a year, on the Federal Emergency Management Agency's initial flood insurance map of the community as having flood-prone areas. (Section 202(a) of the Flood Disaster Protection Act of 1973 (Pub. L. 93-234), as amended). This prohibition against certain types of Federal assistance becomes effective for the communities listed on the date shown in the last column.

The Administrator finds that notice and public procedure under 5 U.S.C. 553(b) are impracticable and unnecessary because communities listed in this final rule have been adequately notified.

Each community received a 6-month, 90-day, and 30-day notification addressed to the Chief Executive Officer that the community will be suspended unless the required floodplain management measures are met prior to the effective suspension date. For the same reasons, this final rule may take effect within less than 30 days.

Pursuant to the provision of 5 U.S.C. 605(b), the Administrator, Federal Insurance Administration, FEMA, hereby certifies that this rule if promulgated will not have a significant economic impact on a substantial number of small entities. As stated in section 2 of the Flood Disaster Protection Act of 1973, the establishment of local floodplain management together with the availability of flood insurance decreases the economic impact of future flood losses to both the particular community and the nation as a whole. This rule in and of itself does not have a significant economic impact. Any economic impact results from the community's decision not to (adopt) (enforce) adequate floodplain management, thus placing itself in noncompliance of the Federal standards required for community participation. In each entry, a complete chronology of effective dates appears for each listed community.

List of Subjects in 44 CFR Part 64

Flood insurance—Floodplains.

PART 64—[AMENDED]

1. The authority citation for part 64 continues to read as follows:

Authority: 42 U.S.C. 4001 et seq., Reorganization Plan No. 3 of 1978, E.O. 12127.

2. Section 64.6 is amended by adding in alphabetical sequence new entries to the table.

§ 64.6 List of Eligible Communities.

State	Location	Community No.	Effective date authorization/cancellation of sale of flood insurance in community	Current effective map date	Date[1]
Region II					
New York	Mamaroneck, town of, Westchester County.	360917	May 12, 1972, Emerg. Dec. 1, 1977, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Region III					
Pennsylvania	Amwell, town of, Washington County.	422615	Jan. 17, 1975, Emerg. Sept. 15, 1989, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Do	Barnesboro, borough of, Cambria County.	420227	Nov. 25, 1974, Emerg. Sept. 15, 1989, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Do	Hopewell, borough of, Bedford County.	420120	July 3, 1975, Emerg. Sept. 15, 1989, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Do	Jackson, township of, Butler County.	421420	Jan. 3, 1975, Emerg. Sept. 15, 1989, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Do	Pike, township of, Clearfield County.	421190	Dec. 3, 1979, Emerg. Sept. 15, 1989, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Virginia	Appalachia, town of, Wise County.	510319	Mar. 27, 1975, Emerg. Sept. 17, 1980, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Region IV					
Georgia	Burke County, unincorporated areas.	130022	Jan. 13, 1976, Emerg. Sept. 15, 1989, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.
Mississippi	Holmes County, unincorporated areas.	280211	Apr. 11, 1974, Emerg. Sept. 15, 1989, Reg. Sept. 15, 1989, Susp.	Sept. 15, 1989	Sept. 15, 1989.

Department of Defense Federal Acquisition Regulation Supplement; Miscellaneous Amendments

AGENCY: Department of Defense (DoD).

ACTION: Final rules.

SUMMARY: Defense Acquisition Circular (DAC) 88–12 amends the DoD FAR Supplement (DFARS) with respect to Appendices H and I, and update of Appendix N to reflect recent changes.

EFFECTIVE DATE: September 15, 1989.

FOR FURTHER INFORMATION CONTACT: Mr. Charles W. Lloyd, Executive Secretary, Defense Acquisition Regulatory Council, ODASD(P)/DARS, OASD(P&L), c/o OUSD(A)(M&RS), Room 3D139, The Pentagon, Washington, DC 20301–3062, telephone (202) 697–7266.

SUPPLEMENTARY INFORMATION:

A. Background

The DoD FAR Supplement is codified in Chapter 2, Title 48 of the Code of Federal Regulations.

The October 1, 1988 revision of the CFR is the most recent edition of that title. It reflects amendments to the 1988 edition of the DoD FAR Supplement made by Defense Acquisition Circulars 86–1 through 86–16.

B. Public Comments

DAC 88–12, Items I and II

Public comments are not solicited with respect to these revisions because they do not have a significant effect beyond agency internal operating procedures.

C. Regulatory Flexibility Act

DAC 88–12, Items I and II

These final rules do not constitute a significant revision within the meaning of Pub. L. 98–577, and publication for public comment is not required. Therefore, the Regulatory Flexibility Act does not apply. However, comments from small entities concerning the affected DoD FAR Supplement Subpart will be considered in accordance with section 610 of the Act. Such comments must be submitted separately. Please cite DAR Case 89–610D in correspondence.

D. Paperwork Reduction Act

These rules do not contain information collection requirements which require the approval of OMB under 44 U.S.C. 3501 et seq.

List of Subjects in 48 CFR Chapter 2

Government procurement.

Charles W. Lloyd,

Executive Secretary, Defense Acquisition Regulatory Council.

August 31, 1989.

This Defense Acquisition Circular is effective September 15, 1989.

Defense Acquisition Circular (DAC) 88–12 amends the DoD Federal Acquisition Regulation Supplement (DFARS) 1988 Edition and prescribes procedures to be followed. The following is a summary of the amendments and procedures.

Item I—Revisions to DFARS Appendices H and I (Final Rule)

DFARS Appendices H and I are revised to add to the Mode/Method of Shipment Codes Code R, European Distribution System/Pacific Distribution System. This additional code reflects a recent change to the Military Standard Transportation Movement (MILSTAMP) Manual.

Item II—Update of Appendix N—Activity Address Numbers (Final Rule)

Appendix N has been updated to reflect changes in Activity Names or Addresses.

Adoption of Amendments

Therefore, the DoD FAR Supplement is amended as set forth below.

1. The authority for 48 CFR Chapter 2 continues to read as follows:

Authority: 5 U.S.C. 301, 10 U.S.C. 2202, DoD Directive 5000.35, and DoD FAR Supplement 201.301.

Appendix H to Chapter 2—[Amended]

2. In Appendix H, Section H–610 is amended by revising Codes F, Q, R, Z, 2 and the first sentence of the description in Code 9 to read as follows:

H–610 Mode/Method of Shipment Codes

Code	Description
	* * * * *
F	MAC Channel and Special Assignment Airlift Mission
	* * * * *
Q	Commercial air freight
R	European Distribution System/Pacific Distribution System
	* * * * *
Z	Military Sealift Command (MSC); controlled, contract, or arranged space
2	Government watercraft, barge, or lighter
	* * * * *
9	Local delivery by government or commercial truck including onbase transfers and deliveries between air, water, or motor terminals and adjacent activities. * * *
	* * * * *

Appendix I to Chapter 2—[Amended]

3. In Appendix I, section I–302 is amended by revising Codes F, Q, R, Z, 2 and the first sentence of the description in Code 9 to read as follows:

I–302 Mode/Method of Shipment Codes

Code	Description
	* * * * *
F	MAC Channel and Special Assignment Airlift Mission
	* * * * *
Q	Commercial air freight
R	European Distribution System/Pacific Distribution System
	* * * * *
Z	Military Sealift Command (MSC); controlled, contract, or arranged space
2	Government watercraft, barge, or lighter
	* * * * *
9	Local delivery by government or commercial truck including onbase transfers and deliveries between air, water, or motor terminals and adjacent activities. * * *
	* * * * *

4. Appendix N to chapter 2 is revised to read as follows:

Appendix N—Activity Address Numbers

Activity Address Numbers are for use in conjunction with the Uniform Procurement Instrument Identification Numbering System as prescribed in subpart 204.70 of the DoD FAR Supplement. The six-character code is use in the first six positions of the Procurement Instrument Identification Number (PIIN). The two-character code is used in the first two positions of the Call/Order Serial Number.

For further information, see subpart 204.70 of the DoD FAR Supplement.

Activities coding procurement instruments shall use only those unique and significant codes assigned by their respective Department/Agency Activity Address Monitor(s). When required, activities shall also be assigned a two-position code. (Newly assigned numbers will be listed in future revisions to Appendix N.)

Army

Chief, Contract Supply Office, SFRD–KS,
Rm 1C642, The Pentagon,
Washington, DC 20310–0103

Navy

Navy Accounting and Finance Center,
(NAFC–624), Washington, DC 20390
(Six-Character Unit Identification Number only)[1]

Air Force

SAF/AQCX, Directorate, Contracting
and Manufacturing Policy,
Washington, DC 20330–5040

Defense Logistics Agency

Chief, Systems Branch (DLA–PPS),
Procurement Division, Defense
Logistics Agency, Cameron Station,
Alexandria, VA 22304–6100

Marine Corps

Headquarters, U.S. Marine Corps, (Code
LBO), Washington, DC 20380–0001
(Six-Character Unit Identification Number only)[1]

Other Defense Agencies

The following agencies will forward requests for Appendix N maintenance to HQDA(JDHQ–SV–W–P), Washington, DC 20310–0600.

Defense Mapping Agency

Director of Acquisition, Defense
Mapping Agency, Washington, DC
20305–3000

Defense Nuclear Agency

Chief, Contract Division, Defense
Nuclear Agency, Washington, DC
20305–1000

Defense Communications Agency

Chief, Logistics Management Office,
Code 202, Defense Communications
Agency, Washington, DC
20305–2000

Department of the Army

DAAA03, B1—Pine Bluff Arsenal, Attn: SMCRM–PO, Pine Bluff, AR 71602–9500

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Part 21

RIN 1018–AA93

Migratory Bird Permits; Permit Exceptions for Captive-Reared Mallards

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Final rule.

SUMMARY: This rule finalizes the Fish and Wildlife Service's (Service) proposal to require the use of nontoxic shot on game preserves, in field trials and during bona fide dog training activities when taking captive-reared mallards. This action is being taken to correct the regulatory anomaly that, heretofore, has allowed lead shot to be used for taking captive-reared mallards in nontoxic (steel) shot zones. The effective date of this requirement has been delayed until the 1990–91 hunting season.

EFFECTIVE DATE: September 1, 1990.

FOR FURTHER INFORMATION CONTACT: Dr. Byron K. Williams, Acting Chief, Office of Migratory Bird Management, U.S. Fish and Wildlife Service, Room 634, Arlington Square, 4401 Fairfax Drive, Arlington, Virginia 22203, or write Director (FWS/MBMO), Mail Stop 634-Arlington Square, 18th & C Streets NW., Washington, DC 20240 (703/358–1714).

SUPPLEMENTARY INFORMATION:

Background

In 1987, it was brought to the attention of the Service by several States that existing exemptions to take captive-reared mallards in nontoxic shot zones with lead shot are inconsistent with the goal of the Service to eliminate lead poisoning in waterfowl and bald eagles. These situations exist because the provisions of this part 21 (§ 21.13) are specifically exempted from the provisions of part 20. In the rule titled "Zones in which lead shot will be prohibited for the taking of waterfowl, coots and certain other species in the 1988–89 season" (52 FR 47428), the Service proposed that § 21.13, Permit exceptions for captive-reared mallards, be changed to make it subject to the requirements of § 20.108 of part 20, Nontoxic shot zones. The proposed rule schedule would have required shooting preserves within existing nontoxic shot zones to convert simultaneously in the 1988–89 season. Other shooting preserves would have been required to convert in the 1989–90, 1990–91 and 1991–92 seasons according to the appendix N schedule of the 1986 Supplemental Environmental Impact Statement on the Use of Lead Shot for Hunting Migratory Birds in the United States (SEIS).

This proposal was based on the knowledge that shooting preserve areas, including "tower shoot" operations, usually host wild waterfowl and raptors at one time or another; the birds are then exposed to the spent shot. Also, when lead shot is used to take captive-reared mallards during field trials or bona fide dog training activities, it results in the deposition of spent shot and potential lead exposure for wild migratory birds. Application of § 20.108 to shooting preserves and these other activities would eliminate additional sources of lead shot and potential lead poisoning mortality for waterfowl and other migratory birds. In fact, the 1986 SEIS did not anticipate waterfowl hunting lead shot enclaves continuing in existence. The nationwide strategy to convert totally to nontoxic shot to eliminate lead poisoning in migratory birds was implemented on the basis that *all* hunting of waterfowl, coots and certain other species would be done with nontoxic shot.

Because of the known interest and paucity of comments received when the proposed rule comment period closed on January 13, 1988, the Service published a clarification, correction and comment period reopening in the **Federal Register** on March 25, 1988 (53 FR 9781). The reopening notice clarified the Service proposal by pointing out the following:

- The section proposed to be revised deals only with captive-reared mallards that are taken under the permit requirements of the Federal regulations.
- This proposal would not change the existing regulations restricting hunting of any other captive-reared species, or use of other captive-reared species in dog trials or dog training. The subsection to which this amendment will be added begins "Captive-reared and properly marked mallard ducks * * * may be acquired * * * and disposed of by any person without a permit, subject to the following conditions * * *" (50 CFR 21.13, Permit exceptions for captive-reared mallards.)
- This regulation is not aimed at bona fide dog training or trials where it is apparent that no one is attempting to take migratory birds. While the words being amended might appear to relate to such trials, the section into which they fit related only to the taking of captive-reared mallards.
- The proposed revision is aimed at establishing a uniform zone requirement for requiring nontoxic shot to take waterfowl, thus eliminating the potential for wild waterfowl and bald eagles to be lead-poisoned from ingestion of lead shot. This regulatory change will ensure that when a county is phased-in for nontoxic shot use the "game farms" or bona fide dog training or field trial operations within that county that are shooting captive-reared mallards are phased-in at the same time.
- Among these other objectives, this proposal would provide regulatory

consistency across nontoxic shot zones and, therefore, consistency in enforcement.

Additionally, the Service pointed out that the taking of wild waterfowl on game preserves has been and will continue to be subject to the nontoxic shot requirement of the county(ies) in which they are located and other regulations of part 20. Likewise, any taking of wild waterfowl during dog training activities or during field trial operations remains subject to *all* Part 20 regulations.

Summary of Comments

Over the period December 14, 1987, to April 25, 1988, when the last comment period closed, approximately 103 letters of comment representing about 90 commentors were submitted specifically on the § 21.13 proposal. Of this number, 10 States provided 15 letters of comment, 82 letters were received from private individuals or owners on behalf of shooting preserves, 3 letters were received from public interest organizations and 3 from members of Congress. The States responding largely supported the proposal; virtually all of the other comments submitted were in opposition to the proposal.

State Comments

Of those potentially affected by this proposal, only 10 State wildlife management agencies provided written comments. Of the 10, only a single State totally opposed the proposal. Most, if not all, of the nonresponding States were contacted by phone to determine if the proposed rule had been received and to obtain oral comments. The States had been sent two separate mailings of the Service's intent to promulgate this rule. Those States not commenting are considered to have provided passive concurrence for the proposal. Written comments of State wildlife management agencies are as follows:

California

The California Department of Fish and Game (Department) advised that Licensed Domesticated Migratory Game Bird Shooting Clubs in that State are required to hunt in a prescribed manner that includes a prohibition against shooting over water. For this reason, the Department argues that no threat of lead poisoning exists for wild waterfowl and, therefore, the proposed regulation is inappropriate to such clubs in California.

Colorado

The Colorado Division of Wildlife (Division) provided general support for the proposal but noted what is perceived as a problem with its inflexibility. The Division agreed that steel shot for captive-reared mallards should become mandatory on areas where spent shot would be scattered in water or wetland areas, utilized by wild waterfowl, or even on adjacent upland areas, including croplands, where wild waterfowl normally feed. However, the Division cited situations where facilities are specifically constructed for field trial or tower-to-pond shooting of captive-reared mallards that are removed from wetlands utilized by wild waterfowl. The Division maintains that these areas that are seldom, if ever, utilized by wild waterfowl should be subject to a process that could provide exemptions to the steel shot requirement on site-by-site basis.

Delaware

The Delaware Division of Fish and Wildlife (Division) stated that nontoxic shot and other applicable Federal regulations should apply to the taking of all waterfowl whether in a "game farm" environment, a regulated shooting area, or elsewhere, because there is a potential to expose wild waterfowl to lead poisoning in most of these areas. However, the Division did not support requiring nontoxic shot for dog training and during field trials outside of wetlands habitat because these areas are open to other forms of hunting where lead is customarily used.

Florida

The Florida Game and Fresh Water Fish Commission supported the proposal, without qualification, to require nontoxic shot for taking captive-reared mallards.

Indiana

The Indiana Department of Natural Resources, Division of Fish and Wildlife (Division) noted a nonobjection to the proposal to require the use of nontoxic shot for taking captive-reared mallards. The Division noted that pen-reared mallards are shot over water and whether it is a pen-reared or wild duck makes no difference in respect to lead being deposited in a wetland.

Kansas

The Kansas Department of Wildlife and Parks (Department) responded that it supports the proposal to require the use of nontoxic shot to take captive-reared mallards. The Department noted that nontoxic shot rules should apply equally to all hunting of waterfowl as a deposit of lead occurs whether fired at wild or captive-reared waterfowl.

Maryland

The Maryland Department of Natural Resources responded that it strongly supports the proposed rule and cited as reasons for doing so: the decoy effect of captive-reared mallards that increases the risk to wild waterfowl—ducks and geese; public relations problems with regard to allowing a segment of the hunting community to use lead shot while others are required to use nontoxic shot; law enforcement problems associated with identifying where nontoxic shot is or is not required; and the problem of continuing exposure of bald eagles to waterfowl containing embedded and/or consumed lead shot.

Minnesota

The Minnesota Department of Natural Resources responded that it favors the requirement to use nontoxic shot for taking captive-reared mallards on shooting preserves and similarly affected areas.

New York

The New York Department of Environmental Conservation (Department) advised that few, if any, of shooting preserve operators in New York were aware of this proposed rule until they were contacted by the State in the second comment period. Thus, the Department requested that "tower shoot" operations be exempted from having to shoot nontoxic shot for 1988–89 only, in order to avert financial problems related to inventories of lead shot that were purchased in anticipation of needs this current season.

Texas

The Texas Parks and Wildlife Department (Department) requested a delay on implementation of this rule until the last year of the nationwide phase-in. This delay of implementation was requested to allow acquisition of specific information concerning the use and impact of lead shot on shooting resorts in Texas.

Issues identified in this group of official State comments, such as deferral of the effective date, exemptions for "tower shoots," etc., are addressed later in this rule, with those of the general public.

Other Comments

As set out above, 88 letters of comment were received from individuals and organizations other than State wildlife management agencies. Public interest organizations submitting comments on the proposals to require nontoxic shot for taking captive-reared

mallards on shooting preserves are the International Shooting and Hunting Alliance (ISHA), the National Rifle Association (NRA), the National Wildlife Federation (NWF) and the Wildlife Legislative Fund of America (WLFA); the NWF supported, and the others opposed, the proposal.

The ISHA stated that the proposal justification is not supported by even a "* * * minimum of factual data or biological information." The ISHA disagreed with the manner in which the justification for the strategy to phase out lead shot nationwide was applied to this proposal because the conditions for lead poisoning to impact wild waterfowl, as set out by the Bellrose Report, are not met. Too, the ISHA submits that the Service abandoned the logical and justifiable "hot spot" approach in considering the use of nontoxic shot "* * * because of ease of law enforcement, unwillingness to allocate personnel and funds to ascertain geographical areas where nontoxic shot was necessary and, quite obviously, bowing to political pressure from the anti-sportsmen community." The ISHA also stated that, despite the disclaimer, no one would be able to use captive-reared mallards for field trials or dog training as "taking" does, in fact, take place. This group also requested a public hearing to provide a record upon which to act.

The NRA is opposed to the proposed rule and urged that private shooting preserves continue to be exempted from the nontoxic shot requirements. The NRA stated that application of nontoxic shot requirements to shooting preserves may result in fewer captive-reared waterfowl being produced and released without any potential for lead poisoning impacts on waterfowl and/or bald eagles. The NRA also stated that many shooting preserves are not visited by wild waterfowl at any time and, thus, lead shot use does not pose a threat to wild waterfowl and/or bald eagles. Lastly, this group stated that in all likelihood less excise taxes and permit fees will be collected because many thousands of captive-reared mallards are raised and harvested than would otherwise be the case if nontoxic shot was required, which would ultimately work to the detriment of the resource.

The NWF strongly supported the proposed rule, stating that "[t]here is no biological reason to assume that lead shot incidental to the covered activities would be any less susceptible to ingestion by waterfowl than shot spent pursuant to the taking of wild waterfowl." The NWF stated that, in this regard "* * * steel shot regulations correctly make no distinction between the taking of wild waterfowl in uplands or wetlands since there is no evidence to suggest that waterfowl or eagles are immune from the effects of ingested or embedded lead shot in upland locations." Further, the NWF stated that the line should logically be drawn around the target species rather than create an enforcement problem associated with attempting to make distinctions between "waterfowl habitat" and wetlands. Too, the NWF cited the anomaly with regard to the exception created for captive-reared mallards by § 21.13 and the unfair situation that further exempting shooting preserves would create for hunters that have no access to such areas and the responsibility that all hunters should share to "* * * pursue their sport in a manner that conserves America's waterfowl and endangered species for the enjoyment of future generations." Finally, the NWF stated that the proposal is viewed by that group as an important component of the nationwide conversion to steel shot.

The WLFA questioned the basis for the decision to effect a nationwide ban on the use of lead shot for waterfowl and coot hunting by the 1991–92 season, and reiterated their support for the "hot spot" approach to the lead poisoning problem. The WLFA then specifically protested the proposed rule on the grounds that it is being done for the convenience and ease of the Service, charging that it is an unwarranted intrusion on private activities and is being done at the expense of legitimate private interests. The WLFA asked that the requirement be eliminated.

The Service also received comments on the proposed rule from one member of the United States House of Representatives and two United States Senators.

The House member stated that the exemption for shooting preserves should be retained on the basis that the exposure of wild waterfowl to lead is minimal because of the limited amount of hunting that occurs on a limited number of shooting preserves. The House member also stated a common objection to nontoxic shot rules that there is still a great deal of controversy and argument in the scientific community regarding the actual overall effect of lead shot on the waterfowl population. Further, shooting preserves are not open to the general public and most of these birds are raised specifically for the purpose of sport hunting.

One Senator urged the Service to take a closer look at the proposed rule, and to leave intact the exemption for privately raised waterfowl on game farms on the basis that the proposal eliminates the exemption wholesale without any regard for the particular circumstances under which a game preserve shoots captive-reared mallards. Further, the Senator stated that some game preserves arrange their shoots such that no shooting occurs over water or where mallards feed, and that the proposal contained no factual data to support the assertion that the exemption should be eliminated.

The other Senator requested that an alternative be developed to preserve options for lead shot usage and to ensure that wild migratory waterfowl would be unlikely to ingest spent lead pellets.

Sixty-five of the letters received on this issue represent shooting preserve interests in the State of New York. Fourteen letters were received from a scattering of other States, including Illinois (1), Iowa (2), Louisiana (1), Minnesota (1), Missouri (1), South Carolina (2), Texas (4), Virginia (1) and Wisconsin (1). Three letters were received from the District of Columbia. Of the 65 New York letters, 16 are from members of the State legislature and offer two themes. One theme is that preserves not shooting over water areas do not expose migratory birds (waterfowl) to lead poisoning and should be exempted. The other theme is that States should be given regulatory authority to allow preserves exemptions on a case-by-case basis. Many, if not most, of the other New York responses and the 17 from the other States and the District also contain these two themes, and expand the bases for objection by citing other factors.

Although the exact manner in which the two themes are expressed varies somewhat from letter group to letter group, the following is representative of the comments received:

> * * * we hunt over dry land, are not part of the flyway and are never visited by migratory wild birds, it is hard to see how the application of the proposed amendment * * * would be consistent with the intent of the steel shot regulations.
>
> If the amendment is approved * * * we request that the states in which the affected hunting preserves exist be granted the authority to permit exceptions.

Other factors injected into the arguments against this requirement by those commenting vary considerably; some are not relevant to this proposed rulemaking and will not be addressed here because they have been responded to in earlier nontoxic shot zone rulemakings. Commentors should refer to the following sources for responses to comments not addressed in this final rulemaking. (References are to the pertinent portions of the Supplemental Environmental Impact Statement on the Use of Lead Shot for Hunting Migratory Birds in the United States (1986) and the final rulemaking for the 1986–87 nontoxic zones (51 FR 31429; September 3, 1986).)

- Arguments against the lead shot-lead poisoning connection in waterfowl and bald eagles, including situations involving shooting over fields and over deep water, observers noting absence of carcasses, perceived documentation deficiencies, etc. (see, for example, Issues 1, 2, 7 and 8 and chapter III of the SEIS);
- Relative merits of the "hotspots" approach vs. the current phase-in strategy (see, for example, Issue 5 and chapters II and IV of the SEIS);
- Crippling and shooting performance of lead vs. steel shot (see, for example, Issue 12 and chapter III, page 86, of the SEIS);
- Cost of steel shot vs. lead shot and availability of steel shot (see, for example, Issue 14 and chapter III, page 90, of the SEIS);
- Capability of steel shot with weapons and safety (see, for example, Issue 13 and chapter IV, pages 11–15, of the SEIS);
- General allegations of arbitrariness in Service actions to eliminate lead poisoning as a mortality factor in waterfowl and coot (see, for example, Issue 3);
- Enforcement concerns (See chapter IV, page 57, of the SEIS); and
- Finding a suitable nontoxic alternative to lead (see, for example, Issue 14 and chapter III, page 90, of the SEIS).

Relevant Issue Identification and Responses

After review of the letters of comment provided to the Service on this proposal, a relatively few relevant common issues emerge. The following is an identification of those relevant common issues raised by commentors and the Service's response to each. Two of those identified, the "themes" mentioned earlier, predominate among the comments submitted and are addressed first as issues 1 and 2.

Issue No. 1: Although expressed in various ways, the essence of this concern is that in the more controlled shooting situations, i.e., "tower shoots," there is little or no potential for exposing wild migratory birds to spent lead shot and consequent lead poisoning.

Response: The Service recognizes that there exists a spectrum of shooting preserve types, from the wild bird/natural habitat conditions on one end to the captive-reared bird/tower-pond shoots on the other; there is also a concomitant spectrum of potential for spent shot exposure. However, even for the "tower shoots," it is virtually impossible to ensure that no exposure to spent lead shot results for wild waterfowl and raptors. Most of those commenting referenced only that the risks were minimal or nonexistent for wild waterfowl. Raptors are an important part of the overall lead shot-lead poisoning equation; bald eagles were a primary consideration in the litigation that resulted in adoption of the nationwide lead shot ban strategy.

Wild waterfowl are attracted to shooting preserves because of the "decoy effect" and/or because "tower shoot" ranges ordinarily include a wetland collection point for the flighted birds. Raptors are attracted to debilitated birds on or off preserves that have embedded and/or ingested shot because of the vulnerability resulting.

Too, it is not necessary for raptors to visit the shooting area to be exposed to ingested and/or embedded lead shot. One commentor pointed out that the club, to which he belongs, raises 25,000 mallards for "tower shoots" and, of that number, 10–15 percent are lost to the wild. Others cited losses of captive-reared birds to the wild at their clubs but stated that it was a positive factor because it supplemented wild populations. Despite the lack of evidence that released or escaped captive-reared mallards are benefiting wild populations of mallards in any significant way, captive-reared mallards undoubtedly transport imbedded or ingested lead shot that can be ingested by bald eagles and other predators remotely from the game preserves.

Issue No. 2: Authority should be delegated to the individual States to certify qualified shooting preserves to be nonproblem lead shot-lead poisoning areas, on a case-by-case basis.

Response: In light of the information presented here and elsewhere in these issues and responses, it should be apparent that the problem is not as simple as visiting game preserves and certifying that problems with lead shot-lead poisoning do not exist on-site because the lead problem is in all probability not that obvious on-site, spatially or temporally, and can be exported off-site as well. Lead poisoning problems traditionally are not readily identified or believed by the casual observer because of the nature of the illness. There are also considerable problems associated with establishing standards/definitions for what does or does not constitute a problem and the administrative burdens associated with inspection, certification and enforcement. Most importantly, exempting certain areas from nontoxic shot requirements is a significant departure from the strategy adopted to eliminate lead poisoning and does not treat the problem evenheandedly. Too, no responding States have suggested that the problem be resolved on the basis that they be empowered to certify game preserves as lead shot-lead poisoning nonproblem sites.

Issue No. 3: The proposal justification is not supported by factual data/biological information.

Response: Although the charges made are much broader than this proposal and are largely answered in the references noted earlier for nonrelevant issues, the Service believes a general response is appropriate. As previously stated, the purpose of this rule is to correct an anomaly existing under the current regulations relating to nontoxic shot requirements. The justification for this action is the same justification presented in the 1986 Supplemental Environmental Impact Statement on the Use of Lead Shot for Hunting Migratory Birds in the United States for implementing a nationwide ban of lead shot for hunting waterfowl. The intent continues to be to cover all hunting activities involving waterfowl, coots and certain other species. (For the purposes of the Migratory Bird Treaty Act, as amended (16 U.S.C. 703 *et seq.*; 40 Stat. 755), captive-reared mallards are migratory waterfowl and subject to Federal regulation.)

It is also important to this discussion to note that a major stimulus for the action to phase out nationwide the use of lead shot for waterfowling is the *NWF* vs. *Hodel* court decision of 1985 (Civ. No. 585–0837 EJG). In this decision, the court found, on the basis of the factual data/biological information, that a lead poisoning problem does exist and that the Department of the Interior had not responded to this problem commensurate with its statutory responsibilities. Since the 1985 decision, the Court has on two separate occasions relied upon that same factual data/biological information to support the Service's actions to eliminate lead poisoning in migratory birds through the cessation of lead shot use for waterfowling.

Issue No. 4: Game farm mallards do not have lead poisoning problems, therefore, lead poisoning cannot be a problem for wild waterfowl or bald eagles; there are no waterfowl and/or eagles in the vicinities of some of the

preserves; wild waterfowl and eagles are kept away from the preserves by all the activities; etc.

Response: Some of the comments provided on this issue were somewhat contradictory. A game preserve operator pointed out that lead poisoning was recognized as a problem for game farm mallards years ago and, therefore, it is in the best interests of the game preserves to ensure that the lead shot does not fall into lakes and streams where feeding occurs. Others stated that the lead shot could not conceivably cause lead poisoning because it is deposited in upland areas away from the flight terminus—usually a pond. Others readily agreed that the lead shot does reach areas where it is accessible to wild and captive-reared waterfowl but stated that lead poisoning has never been noted in the captive-reared birds that utilize the pond areas for as long as 9 months out of the year. Assurances were also given that some of these areas were not within any flyway, and are not frequented by bald eagles.

For captive-reared waterfowl, there are probably few studies illustrating the lead risk. One such study of Hungarian mallards (Salyi et al. 1987) showed an associated decreased flying ability and wing and leg paralysis from physiological damage after ingestion of lead shot in the shooting area. In a recent (1988) radiological evaluation of captive-reared mallards shot in an upland area at Winchester's Nilo Farms, fully 12 percent of the birds had ingested lead shot although that "tower" shooting operation had been steel-only for 2 years.

As captive-reared mallards return overland to the release site from the flight terminus there is ample opportunity to ingest shot when picking up grit for the gizzard. Thus, the fact that ponds at the flight terminus are not shot-over may not preclude captive-reared mallards from ingesting spent lead shot. Certainly, many do carry embedded shot.

The concept of a "flyway" can be misunderstood. Although the number of birds passing through a given area in the north may be quite small in comparison to that of a comparably-sized area in the south, both are a part of a "flyway." All of the States of the contiguous States and Alaska are part of a "flyway." Eagles and other raptors also have migratory routes, "flyways," that may bring them to the vicinities of game preserves on a seasonal basis. However, their absence in a given area may mean only that bald eagle recovery there has not been as successful as it should be. Although bald eagle recovery is very encouraging in some parts of the United States, there are large portions of the historical range that are still unused or the numbers there are still below established recovery goals. The use of lead shot for captive-reared and wild waterfowl shooting is clearly inimical to the long-term recovery objectives for bald eagles.

Issue No. 5: Two concerns addressed in this single response relate to the charges that the proposal totally eliminates lead shot use from game preserves and is a "foot-in-the-door" to require nontoxic shot for taking other species.

Response: As stated earlier, the reopening **Federal Register** notice of March 25, 1988, explains that the proposal is restricted to § 21.13 of 50 CFR, Permit exceptions for captive-reared mallards, and does not change the existing regulations restricting hunting of any other captive-reared species, or use of other captive-reared species in dog trials or dog training. The implementation of nontoxic shot zones affects only the taking of waterfowl, coots and certain other species—"certain other species" referring to species taken in an aggregate with waterfowl or coots. Thus, the use of lead shot is not disallowed for taking other game preserve species that would otherwise be allowed by Federal and/or State regulations. The regulation change being implemented still allows shooting captive-reared mallards over water areas, it simply requires that it be done with nontoxic shot.

There are currently no data available that suggest a necessity to expand a nationwide requirement for nontoxic shot to other species of migratory birds. States may be, and sometimes are, more restrictive in their regulations to take other species (migratory and nonmigratory) in instances where there are lead poisoning problems.

One person commenting on the upland game bird aspect of this situation remarked that it is illogical to require nontoxic shot for captive-reared mallards and not pheasants when on preserves both may be hunted in the same areas. States customarily have primary authority for managing upland game birds. It would be a State's prerogative to require nontoxic shot for pheasants and other upland game species except where Federal lands involve a cooperative effort by the State and the managing Federal agency. In this regard, on Service managed lands, the Service is cooperating with the States to require the use of nontoxic shot to hunt pheasants and other upland game species in wetlands. Some States have taken the initiative to require nontoxic shot on all State-regulated hunting areas.

Issue No. 6: Steel shot is not compatible with some double barreled shotguns used by members of game preserves; game preserves are the last areas where the expensive, "classic" American and European double guns may be used for waterfowling because of the exemption there for lead shot.

Response: The Service has consistently stated to waterfowlers and other members of the interested public that, in the process of converting the nation from lead shot to steel shot for waterfowl and coot hunting to eliminate lead poisoning in migratory birds, there are shotguns having thin-walled or soft steel barrels that likely could not be used with steel shot. Nevertheless, the Service has not given exemptions for hunters who have traditionally used these antique or "classic" shotguns with such barrels—even off game preserves. Neither has the Service given exemptions to the relatively small number of waterfowlers who hunt with muzzleloading guns of recent or early ("originals") manufacture. Although their use for waterfowling may have to be discontinued under this regulatory change, these breechloading antique or "classic" shotguns may still be used for hunting upland birds and/or migratory birds other than waterfowl or coot. For the game preserves that require the use of double guns, there are doubles sold currently that are certified for steel shot. Some older, "classic" doubles are reputedly suitable for use with steel shot, but should be approved for use by the manufacturer or a qualified gunsmith.

Issue No. 7: Field trials and bona fide dog training activities should be exempted because in the areas where these two activities occur it is also common for other game birds to be hunted.

Response: This comment has been substantially addressed in Issue No. 5. Further, training and field trials with captive-reared mallard taking usually involves retrieving dogs in water and field areas that often are available to wild waterfowl. Requiring nontoxic shot for these activities will help to ensure that such areas do not present lead exposure opportunities and lead poisoning. Where these same areas have upland game bird hunting, the State has the prerogative to expand nontoxic shot coverage beyond captive-reared and wild waterfowl and coots. However, it should be recalled that the developing nationwide ban on the use of lead shot for waterfowling involves uplands as well as wetlands.

Issue No. 8: The implementation of this rule as proposed will place an economic burden on shooting preserves because they have already purchased ammunition supplies that will not be legal to use in the coming season.

Response: Recognizing that some shooting preserve operators may have inventories of lead shot ammunition, and consistent with its approach of "phasing-in" steel shot use in proportion to the risks posed to migratory birds, the Service is delaying the implementation of this rule requiring the use of nontoxic shot for taking captive-reared mallards until September 1, 1990.

In summary, this final rule makes § 21.13 of part 21, Permit exceptions for captive-reared mallards, subject to the requirements of § 20.108, Nontoxic shot zones, and becomes effective on September 1, 1990. All game preserves and other affected areas in existing nontoxic shot zones will convert to steel shot for taking captive-reared mallards simultaneously in the 1990–91 waterfowl hunting season. Game preserves and dog training/field trial areas not affected by the 1990–91 zoning will convert to steel shot in the final year of the nationwide phase-in, i.e., in the 1991–92 waterfowl hunting season.

This action is taken under the authority granted the Secretary of the Interior by the Migratory Bird Treaty Act and the Endangered Species Act, as amended (16 U.S.C. 1531–1543; 87 Stat. 884). Justification for this action is based on: The 1986 SEIS analyses of the effects of the use of lead shot in waterfowl and coot hunting on migratory birds; scattered and light response from the general public and the States; the support of the majority of the States responding; the discriminatory effect that continuing this exemption would have on a portion of the waterfowl hunting community; and the need to be consistent in the approach to eliminating lead poisoning in waterfowl and raptors, nontoxic shot zoning and enforcement and compliance with nontoxic shot requirements.

Economic Effect

Executive Order 12291, "Federal Regulation," of February 17, 1981, requires the preparation of regulatory impact analyses for major rules. A major rule is one likely to result in an annual effect on the economy of $100 million or more; a major increase in costs or prices for consumers, individual industries, government agencies or geographic regions; or significant adverse effects on the ability of United States-based enterprises to compete with foreign-based enterprises. The Regulatory Flexibility Act of 1980 (5 U.S.C. 601 *et seq.*) further requires the preparation of flexibility analyses for rules that will have a significant effect on a substantial number of small entities, which includes small businesses, organizations and/or governmental jurisdictions.

In accordance with Executive Order 12291, a determination has been made that this rule is not a major rule. In accordance with the Regulatory Flexibility Act, a determination has been made that this rule, if implemented without adequate notice, could result in lead shot ammunition supplies for which there would be no local demand. Conversely, nontoxic shot zones could conceivably be established where little or no nontoxic shot ammunition would be available to hunters. The Service believes, however, that adequate notice has been provided and that sufficient supplies of nontoxic shot ammunition will be available to hunters. Therefore, this rule would not have a significant economic effect on a substantial number of small entities.

Paperwork Reduction Act

This rule will not result in the collection of information from, or place recordkeeping requirements on, the public under the Paperwork Reduction Act of 1980 (44 U.S.C. 3501 *et seq.*).

Environmental Considerations

Pursuant to the requirements of section 102(2)(C) of the National Environmental Policy Act of 1969 (42 U.S.C. 4332(2)(C)), a Final Environmental Statement (FES) on the use of steel shot for hunting waterfowl in the United States was published in 1976. As stated above, a supplement to the FES was completed in June 1986. In this supplement, pursuant to the Endangered Species Act, a section 7 consultation was done on the potential impacts of the provisions of this rule on bald eagles. The section 7 opinion concluded that implementation of the preferred alternative would not be likely to jeopardize the continued existence of the bald eagle. More recently, a section 7 opinion concluded that the actions being carried out to ban the use of lead shot nationwide for waterfowl hunting is not likely to jeopardize the continued existence of the Aleutian Canada goose.

Authorship

The primary author of this final rule is Dr. Keith A. Morehouse, Staff Specialist, Office of Migratory Bird Management.

List of Subjects in 50 CFR Part 21

Exports, Imports, Reporting requirements, Wildlife.

Accordingly, part 21, subchapter B, chapter I of title 50 of the Code of Federal Regulations is amended as follows:

PART 21—[AMENDED]

1. The authority citation for part 21 continues to read as follows:

Authority: Migratory Bird Treaty Act, sec. 3, Pub. L. 65–186, 40 Stat. 755 (16 U.S.C. 704); sec. 3(h)(3), Pub. L. 95–616, 92 Stat. 3112 (16 U.S.C. 712).

2. Section 21.13(d) is amended by revising the language beginning with "Provided further," and ending with the words "preserve operations," to read as follows (the introductory paragraph is being republished):

§ 21.13 Permit exceptions for captive-reared mallard ducks.

Captive-reared and properly marked mallard ducks, alive or dead, or their eggs may be acquired, possessed, sold, traded, donated, transported and disposed of by any person without a permit subject to the following conditions, restrictions and requirements.

* * * * *

(d) * * * *Provided further,* That the provisions of:

(1) The hunting regulations (part 20 of this subchapter), with the exception of § 20.108 (Nontoxic shot zones), and

(2) The Migratory Bird Hunting Stamp Act (duck stamp requirement) shall not apply to shooting preserve operations, * * *

* * * * *

Dated: August 10, 1989.

Richard N. Smith,

Acting Director, Fish and Wildlife Service.

Proposed Rules

Federal Register
Vol. 54, No. 170
Tuesday, September 5, 1989

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

OFFICE OF PERSONNEL MANAGEMENT

5 CFR Part 841

RIN 3206–AD62

Federal Employees Retirement System; General Administration; Cost of Living Adjustments

AGENCY: Office of Personnel Management.

ACTION: Proposed rule.

SUMMARY: The Office of Personnel Management (OPM) is proposing regulations concerning computation of the cost-of-living adjustment (COLA) on basic benefits under the Federal Employees Retirement System (FERS). These regulations state which benefits are subject to COLA's and provide the methodology for computing COLA's on each type of FERS basic benefit subject to COLA's. These regulations also provide the methodology for determining the COLA's on mixed annuities (partially computed under FERS and partially computed under the Civil Service Retirement System (CSRS)). These regulations are necessary to implement the Federal Employees Retirement System Act of 1986.

DATE: Comments must be received on or before November 6, 1989.

ADDRESS: Send comments to Reginald M. Jones, Jr., Assistant Director for Retirement and Insurance Policy; Retirement and Insurance Group; Office of Personnel Management; P.O. Box 57; Washington, DC 20044; or deliver to OPM, Room 4351, 1900 E Street NW., Washington, DC.

FOR FURTHER INFORMATION CONTACT: Harold L. Siegelman, (202) 632–4682.

SUPPLEMENTARY INFORMATION: FERS COLA's are effective December 1 of each year and first appear in the January annuity payments for those eligible for the increases.

1. COLA's on FERS Basic Annuities and Survivor Annuities

Generally, FERS COLA's are 1 percent less than the actual increase in the cost of living as determined under the law. However, if the actual increase is between 2 and 3 percent, FERS COLA's are 2 percent and, if the actual increase is 2 percent or less, FERS COLA's match the inflation rate. FERS COLA's apply to retirees' basic annuities only (not annuity supplements), but for survivor annuitants they apply to both the basic survivor annuities and the annuity supplements. In addition, FERS COLA's do not apply for annuitants who are under age 62 as of December 1, except:

1. Spouse, former spouse, or insurable interest survivor annuitants;
2. Certain disability annuitants;
3. Those who retired under the special provisions for law enforcement officers and firefighters;
4. Those who retired under the special provision for air traffic controllers; and
5. Those who retired under the special provision for military reserve technicians because they ceased satisfying the requirements of their position due to a disability.

Under FERS, children's annuities are increased under CSRS provisions rather than FERS provisions. However, children's benefits under FERS are offset by social security children's benefits (which also receive a cost-of-living increase effective December 1). In most cases the social security benefit will exceed the FERS benefit, with the result that no FERS benefit is actually paid.

Generally, COLA's are not payable on disability annuities during the first year (nor does the social security offset increase during the first year). However, COLA's are payable during the first year if the annuity rate payable is the retiree's earned benefit or if the annuity is being redetermined because the retiree has reached age 62 during the first year. After the first year, both the disability benefit and the social security offset (if any) are increased by FERS COLA's. Disability annuitants' earned benefits also increase with COLA's, even when we are not paying the earned benefits. After application of the COLA, we compare the increased earned benefit to the increased 40 percent disability benefit offset by social security and pay the greater benefit until the annuity is redetermined at age 62. After age 62, we compare the redetermined annuity with the earned annuity after application of COLA's and we pay the greater benefit.

Full COLA's are paid only to annuitants who have been on the annuity roll for the full period covered by the COLA. Others receive only prorated shares of full COLA's. For example, FERS COLA's were payable on annuities having a commencing date before December 1, 1988. The full 1988 FERS COLA rate was 3.0 percent, but, only FERS annuities that commenced before January 1, 1988, received the full 1988 COLA. Annuities that began on or after January 1, 1988, received prorated COLA's according to the commencing date of the annuity. For survivors (other than children) of deceased annuitants, the proration was determined by the date the annuity was first payable to the deceased annuitant, and COLA's were applied to annuity supplements as well as basic survivor annuities. Eligible FERS annuitants received prorated COLA's effective December 1, 1988, according to the following chart:

Month annuity commenced	Proportion of full 3.0% increase	Prorated percentage
January 1988	11/12	2.8
February 1988	10/12	2.5
March 1988	9/12	2.3
April 1988	8/12	2.0
May 1988	7/12	1.8
June 1988	6/12	1.5
July 1988	5/12	1.3
August 1988	4/12	1.0
September 1988	3/12	0.8
October 1988	2/12	0.5
November 1988	1/12	0.3

Annuitants who do not get COLA's during their first year because they are under age 62 will have been on the annuity roll for over a full year when eligible for their first COLA's; therefore, their first COLA's are not prorated. The same is true for disability annuitants barred from receiving COLA's during their first year as annuitants.

2. COLA's on Basic Employee Lump Sum Death Benefits

Under FERS, a basic lump sum benefit is payable to the surviving spouse (or by court order to a former spouse) of a deceased employee with at least 18 months creditable civilian service. The law provides that this lump sum benefit is an amount equal to half the employee's final annual pay (or high-3 average pay, if higher) plus $15,000, adjusted for COLA's under CSRS rules.

Since the COLA's under CSRS rules were 4.2 percent and 4.0 percent effective December 1, 1987, and 1988, respectively, the $15.000 has increased to $16,255.20.

3. Applying COLA's to Combined CSRS/FERS Annuities

To compute COLA's on mixed benefits, we first compute the initial retired employee annuity rate. After applying CSRS rules to CSRS service and FERS rules to FERS service to obtain the annual amount payable for each component, we make any applicable FERS reductions for age and/or survivor benefits to each component. The sum of the two components is the initial annual annuity rate. The initial monthly installment is ⅟₁₂th (with cents dropped) of the initial annual annuity rate. Then, we determine the initial whole-dollar amount of the monthly CSRS component by dividing the annual CSRS component by 12 and dropping any odd cents. The initial whole-dollar amount of the monthly FERS component equals the initial monthly rate minus the initial monthly whole-dollar CSRS component. The following example illustrates the computation of the initial whole-dollar amount of monthly CSRS and FERS components for an annual CSRS component of $11,987.76 and an annual FERS component of $15.30:

—Initial monthly installment: $1,000
  Annual CSRS component divided by 12: 998.980
  Annual FERS component divided by 12: 1.275
—Drop odd cents from CSRS component $998
—Subtract CSRS component (less any cents) from monthly installment.
—The balance—$2—is the FERS component.

In some cases an employee with only a month or two of FERS service would have a monthly FERS component of zero under the method described above for determining the amounts of the components. In such cases, the FERS component will be the minimum of $1 per month in addition to the CSRS component. This FERS component receives a $1 COLA. (Employees with less than a month of FERS service have no FERS components and are not due any FERS COLA's.)

After computing the initial retired employee annunity rates, we can apply COLA's to employee annunities. COLA's are determined by applying the appropriate increase to each component and rounding to the next lower dollar (each component must increase by at least one dollar) before adding them together for the new monthly amount payable. The components are already whole-dollar amounts to which we can apply future COLA's. For example:

	CSRS	FERS	Monthly amount payable
Component	$998	$2	$1,000
COLA	1.05	1.04	
Total	1,047.90	2.08	
New amounts	1,047	3	1,050

Survivor annuities do not have CSRS/FERS components. The initial survivor annuity is 50 percent (or in some cases 25 percent) of the annual amount of the retiree's annuity before reduction for the survivor benefit. The initial monthly survivor rate is 1/12th of the annual survivor rate, rounded down to the next lower dollar (but not less than one dollar).

Because the CSRS and FERS COLA's are usually computed using different rates and because FERS generally does not pay COLA's for retirees under age 62, the total annuity increases at a rate different from either of its components.

When the retiree dies, the monthly rate payable to the survivor is the initial monthly survivor rate increased by the total percent by which the deceased's annuity had increased since retirement.

For example:

A. At Retirement

- Retiree's annual annuity rate before reduction for survivor annuity: $17,567.89
- Retiree's rate after 10 percent reduction for survivor benefit and conversion to monthly rate: $17,567.89 × .90 = $15,811.10, divided by 12 and rounded to the next lower dollar: $1,317
- Initial monthly survivor rate (50 percent of retiree's annual rate before reduction for survivor benefit, divided by 12 and rounded to the next lower dollar): $17,567.89 × .50 = $8783.95, divided by 12 and rounded to the next lower dollar: $731

B. At Retiree's Death

- Retiree's monthly annuity rate at death: $2,174
- Total percent of increase in retiree's monthly annuity rate since retirement began: 65 percent
- Initial monthly survivor annuity payable ($731 × 1.65, rounded to next lower dollar): $1,206

C. After the Retiree Dies and the Survivor Annuity Has Begun

- The survivor annuity increases according to FERS COLA provisions.

4. COLA's for Certain Military Reserve Technicians

Under section 8462(c)(3)(B)(ii) of title 5, United States Code, military reserve technicians who retired under section 8414(c) of title 5, United States Code, as a result of a disability are excepted from the bar against COLA increases for retirees under age 62. Section 841.708 provides that for this purpose disability means medical disability.

Military reserve technicians who meet the requirements that apply to the general employee population may retire under the general disability retirement rule, section 8451(a)(1)(B) of title 5, United States Code. This allows retirement of military reserve technicians who are medically disabled for their positions and who meet the same disability provisions as other disabled Federal employees.

In addition, military reserve technicians may retire under either of two special provisions depending on their age and length of service. Section 8414(c) of title 5, United States Code, provides a special form of discontinued service retirement for military reserve technicians. It allows retirement of military reserve technicians who may not be disabled for their positions, but are medically or nonmedically disqualified for military service or the rank required to hold the position, and who are at least age 50 with 25 years of service.

Section 8456 of title 5, United States Code, allows military reserve technicians who are not eligible under section 8451(a)(1)(B) or section 8414(c) but who are medically disqualified for military service or the rank required to hold their positions to retire on disability. These technicians retire under the general disability provision, but the annuity stops if they are rehired in the Federal service or they decline a Federal job offer.

Technicians who retire under the disability provisions (section 8451(a)(1)(B) or section 8456) get COLA's after their first full year on the disability rolls. In providing COLA's for military reserve technicians retiring under the discontinued service provision (section 8414(c)) only when the technicians are disabled, section 8462(c)(3)(B)(ii) distinguishes between medical and nonmedical disqualification from military service or rank.

Usually, when technicians retire under section 8414(c), neither OPM nor the technician's employing office receives information about the reason for disqualification. These regulations provide that when we receive no information about the reason for the disqualification, we will process the case assuming that the disqualification was for a nonmedical reason. We will inform these retirees that they will not receive COLA's until they reach age 62 unless they provide an official certification from the military showing that their disqualification was for medical reasons.

E.O. 12291, Federal Regulation

I have determined that this is not a major rule as defined under section 1(b) of E.O. 12291, Federal Regulation.

Regulatory Flexibility Act

I certify that this regulation will not have a significant economic impact on a substantial number of small entities because the regulation will only affect Federal agencies and retirement payments to retired Government employees, spouses, and former spouses.

Constance B. Newman,

Director.

Accordingly, OPM proposes to amend 5 CFR part 841 as follows:

PART 841—FEDERAL EMPLOYEES RETIREMENT SYSTEM—GENERAL ADMINISTRATION

1. The authority citation for part 841 is revised to read as follows:

Authority: 5 U.S.C. 8461; Section 841.108 also issued under 5 U.S.C. 552a; subpart D also issued under 5 U.S.C. 8423; Section 841.504 also issued under 5 U.S.C. 8422; Section 841.507 also issued under section 505 of Public Law 99–335; Subpart J also issued under 5 U.S.C. 8469.

Subpart A—General Provisions

2. In § 841.102, paragraph (a)(7) is revised to read as follows:

§ 841.102 Regulatory structure for the Federal Employees Retirement System.

(a) * * *

(7) Cost-of-living adjustments (subpart G);

* * * * *

3. Subpart G is added to read as follows:

Subpart G—Cost-of-Living Adjustments

Sec.

841.701 Purpose and scope.
841.702 Definitions.
841.703 Increases on basic annuities and survivor annuities.
841.704 Proration of COLA's.
841.705 Increases on basic employee death benefits.
841.706 Increases on combined CSRS/FERS annuities.
841.707 COLA's affecting computation of survivor supplements.
841.708 Special provisions affecting retired military reserve technicians.

Subpart G—Cost-of-Living Adjustments

§ 841.701 Purpose and scope.

(a) The purpose of this subpart is to regulate computation of cost-of-living adjustments (COLA's) for basic benefits under the Federal Employees Retirement System (FERS).

(b) This subpart provides the methodology for—

(1) Computing COLA's on each type of FERS basic benefit subject to COLA's; and

(2) Computing COLA's on mixed annuities (partially computed under FERS and partially computed under the Civil Service Retirement System (CSRS)).

(c) COLA's on children's annuities are not covered by this subpart because COLA's on children's annuities are computed under CSRS rules.

§ 841.702 Definitions.

In this subpart—

Annuity supplement means the benefit under subpart E of part 842 of this chapter. An "annuity supplement" is only payable to retirees.

Basic annuity means the benefits computed under subpart D of part 842 of this chapter and payable to retirees.

Basic employee death benefit means the basic employee death benefit as defined in § 843.102 of this chapter.

Beneficiary of insurable interest annuity means a person receiving a recurring benefit under FERS that is payable (after the employee's, Member's, or retiree's death) to a person designated to receive such an annuity under § 842.605 of this chapter.

COLA means a cost-of-living adjustment.

Combined CSRS/FERS annuity means the recurring benefit with a CSRS component and a FERS component. A "combined CSRS/FERS annuity" is only payable to a retiree who as an employee elected to transfer to FERS under part 846 of this chapter, who at the time of transfer had at least 5 years of civilian service creditable under CSRS (excluding service that was subject to both social security and partial CSRS deductions), and who was covered by FERS for at least 1 month.

CSRS means the Civil Service Retirement System as described in subchapter III of chapter 83 of title 5, United States Code.

CSRS component means the portion of a combined CSRS/FERS annuity that is computed under CSRS rules.

Current spouse annuity means a current spouse annuity as defined in § 842.602 of this chapter.

Disability retiree means a retiree who retired under part 844 of this chapter

Effective date means the date annuities increased by a COLA begin to accrue at the higher rate.

FERS means the Federal Employees Retirement System as defined in chapter 84 of title 5, United States Code.

FERS component means the portion of a combined CSRS/FERS annuity computed under FERS rules.

Former spouse annuity means a former spouse annuity as defined in § 842.602 of this chapter.

Initial monthly rate means the monthly annuity rate that a retiree (other than a disability retiree) is entitled to receive at the time of retirement (as defined in § 842.602 of this chapter).

Percentage change means the percent change in the price index as defined in section 8462(a)(2) of title 5, United States Code.

Retiree means a retiree as defined in § 842.602 of this chapter.

Survivor means a person receiving a current spouse annuity or a former spouse annuity, or the beneficiary of an insurable interest annuity. As used in this subpart, "survivor" does not include a child annuitant.

Survivor supplement means the recurring benefit payable to a survivor under § 843.308 of this chapter.

§ 841.703 Increases on basic annuities and survivor annuities.

(a) Except as provided in §§ 841.704, 841.706, and 841.707, and paragraph (e) of this section COLA's on basic annuities and survivor annuities are the greater of—

(1) One dollar per month; or

(2)(i) If the percentage change is less than 2 percent, the percentage change;

(ii) If the percentage change is at least 2 percent and not greater than 3 percent, 2 percent; and

(iii) If the percentage change exceeds 3 percent, 1 percentage point less than the percentage change.

(b) After survivor annuities commerce, they are subject to COLA's computed under paragraph (a) of this section, even if they are based on a basic employee annuity that includes a CSRS component.

(c) COLA's apply to basic annuities (not to annuity supplements), survivor annuities, and survivor supplements.

(d) COLA's do not apply for annuitants who are under age 62 as of the effective date, except—

(1) Survivors;

(2) Disability retirees (other than disability retirees whose benefit is based on 60 percent of high-3 average salary);

(3) Retirees who retired under § 842.208 of this chapter (the special provisions of law enforcement officers and firefighters);

(4) Retirees who retired under § 842.207 of this chapter (the special provision for air traffic controllers);

(5) Retirees who retired under § 842.210 of this chapter (the special provision for military reserve technicians who ceased satisfying the requirements of their position) due to a disability.

(e)(1) Except as provided in paragraph (e)(2) of this section, COLA's are not payable to disability retirees during the first year.

(2) COLA's are payable to disability retirees during the first year if the annuity rate payable is the retiree's earned benefit or the annuity is redetermined because the retiree has reached age 62.

(3) After the first year, both the disability benefit and the social security offset (if any) are increased by COLA's. Disability retirees' earned benefits also increase with COLA's, even when earned benefits are not paid. After application of the COLA, the greater of the increased 40 percent benefit offset by social security or the increased earned benefit is paid until the annuity is redetermined at age 62. After age 62, the redetermined annuity and earned annuity are compared after application of COLA's and the greater benefit is paid.

(f) COLA's are payable to retirees and survivors whose annuities commence before the effective date.

§ 841.704 Proration of COLA's.

(a) The full amounts of COLA's are payable on annuities having a commencing date more than 11 months before the effective date.

(b)(1) Prorated portions of COLA's are payable on annuities having a commencing date within 11 months before the effective date.

(2) Proration is based on the number of months (with any portion of a month counting as a month) between the annuity commencing date and the effective date.

(3) For survivors of deceased retirees, proration is determined by the date the annuity was first payable to the deceased retiree. COLA's apply to survivor supplements as well as basic survivor annuities.

(4) Proration applied to the assumed social security disability insurance benefit is based on the commencing date of the disability annuity, not the beginning of the social security disability benefit.

§ 841.705 Increases on basic employee death benefits.

(a) COLA's on the basic employee death benefit increase the $15,000 component by the percentage change.

(b) Recipients of the basic employee death benefit are entitled to COLA's if the employee or Member died on or after the effective date.

§ 841.706 Increases on combined CSRS/FERS annuities.

(a) COLA's on combined CSRS/FERS annuities are computed by increasing the CSRS component by the percentage change and the FERS component by the amount of COLA's under § 841.703(a).

(b) The initial monthly CSRS component is computed by—

(1) Applying CSRS rules to CSRS service and FERS rules to FERS service to obtain the annual amount payable for each component, then

(2) Making any applicable FERS reductions for age and/or survivor benefits to each component; then

(3) Dividing the annual amount of the CSRS component by 12, then

(4) Dropping any cents from the CSRS component.

(c) The initial monthly FERS component is computed by subtracting the initial monthly CSRS component from the initial monthly rate.

(d) A retiree who was covered under FERS for at least 1 month has an FERS component. If the amount of the FERS component as computed above is zero (because the CSRS component is equal to the monthly installment, leaving no balance for the FERS component), the FERS component is $1 per month. The reitree is due a full dollar increase on the FERS component with the next COLA. (An employee with less than a month of FERS service has no FERS component and is not due any FERS COLA's.)

(e) COLA's are determined by applying the appropriate increase to each component and rounding to the next lower dollar (each component must increase by at least 1 dollar if a COLA applies to each component) before adding them together for the new monthly amount payable.

§ 841.707 COLA's affecting computation of survivor supplements.

For purposes of computing the assumed CSRS annuity under § 843.308 of this chapter, the assumed CSRS annutiy includes COLA's computed under CSRS rules.

§ 841.708 Special provisions affecting retired military reserve technicians.

(a) Military rearve technicians who retire as a result of a medical disability are excepted from the bar against COLA increases for retirees under age 62.

(b) Military reserve technicians have retired as a result of a medical disability if they retire under—

(1) Section 8451(a)(1)(B) of title 5, United States Code, (that allows retirement by military reserve technicians who are medically disabled for their positions); or

(2) Section 8456 of title 5, United States Code, (that allows military reserve technicians who are not disabled for their positions and who are not eligible under the special military reserve technician discontinued service provisions (section 8414(c)) but who are medically disqualified for military service or the rank required to hold their positions).

(c)(1) Military reserve technicians have not retired as a result of a medical disability if they retire under section 8414(c) of title 5, United States Code, (that allows retirement of military reserve technicians who may not be disabled for their positions, but are medically or nonmedically disqualified for military service or the rank required to hold the position, and who are at least age 50 with 25 years of service) unless they provide OPM official documentation from the military showing that their disqualification was for medical reasons.

(2) When OPM receives no information about the reason for the disqualification of a military reserve technician retiring under section 8414(c) of title 5, United States Code, OPM will process the case assuming that the disqualification was for nonmedical reasons. OPM will inform these retirees that they will not receive COLA's until they reach age 62 unless they provide an official certification from the military showing that their disqualification was for medical reasons.

BILLING CODE 6325-01-M

DEPARTMENT OF AGRICULTURE

Agricultural Marketing Service

7 CFR Part 982

[Docket No. FV-89-020PR]

Filberts/Hazelnuts Grown in Oregon and Washington; Proposed Administrative Changes

AGENCY: Agricultural Marketing Service, USDA.

ACTION: Proposed rule.

SUMMARY: This action invites comments on deletions, revisions, and additions to the administrative rules and regulations under the Federal marketing order for filberts/hazelnuts grown in Oregon and Washington. These proposed changes were unanimously recommended by the Filbert/Hazelnut Marketing Board (Board), which is responsible for local administration of the order. These changes are intended to reflect the Board's current needs and practices by making administrative changes to improve administration of the order.

DATES: Comments must be received by October 5, 1989.

ADDRESSES: Interested persons are invited to submit written comments concerning this proposal. Comments must be sent in triplicate to the Docket Clerk, F&V, AMS, USDA, Room 2525-S, P.O. Box 96456, Washington, DC 20090-6456. All comments should reference the docket number and the date and page number of this issue of the **Federal Register** and will be made available for public inspection in the Office of the Docket Clerk during regular business hours.

FOR FURTHER INFORMATION CONTACT: Maureen T. Pello, Marketing Specialist, Marketing Order Administration Branch, Fruit and Vegetable Division, AMS, USDA, Room 2525-S, P.O. Box 96456, Washington, DC 20090-6456; telephone: (202) 382-1754.

SUPPLEMENTARY INFORMATION: This proposed rule is issued under Marketing Agreement and Order No. 982 (7 CFR part 982), as amended, regulating the handling of filberts/hazelnuts grown in Oregon and Washington. This order is effective under the Agricultural Marketing Agreement Act of 1937, as amended (7 U.S.C. 601-674), hereinafter referred to as the Act.

This proposed rule has been reviewed under Executive Order 12291 and Departmental Regulation 1512-1 and has been determined to be a "nonmajor" rule under criteria contained therein.

Pursuant to requirements set forth in the Regulatory Flexibility Act (RFA), the Administrator of the Agricultural Marketing Service (AMS) has considered the economic impact of this proposal on small entities.

The purpose of the RFA is to fit regulatory actions to the scale of business subject to such actions in order that small businesses will not be unduly or disproportionately burdened. Marketing orders issued pursuant to the Act, and rules issued thereunder, are unique in that they are brought about through group action of essentially small entities acting on their own behalf. Thus, both statutes have small entity orientation and compatibility.

There are approximately 26 handlers of filberts/hazelnuts subject to regulation under the filbert/hazelnut marketing order, and approximately 1,300 producers in the Oregon and Washington production area. Small agricultural producers have been defined by the Small Business Administration (13 CFR 121.2) as those having gross annual revenues for the last three years of less than $500,000, and small agricultural service firms are defined as those whose gross annual receipts are less than $3,500,000. The majority of handlers and producers of filberts/hazelnuts may be classified as small entities.

This proposed rule would make several changes to the administrative rules and regulations of the filbert/hazelnut marketing order. Several changes are necessary to update administrative rules and regulations to reflect the August 19, 1986, (51 FR 2947) amendments to the marketing order.

Form numbers specified in the administrative rules and regulations need to be changed to reflect the current form numbers used by the Board. Additionally, for clarity, the Board has recommended that other specific form references be inserted into sections that previously contained only a general reference to reporting requirements. No new forms are added as a result of reference changes.

Further, the Board has recommended that the term "hazelnuts" be used in the rules and regulations to reflect the fact that filberts may also be called hazelnuts. This is reflected by the definition of filberts in the order. In addition, hazelnuts is the term used in Europe where a portion of the domestic crop is marketed. Therefore, this rule would change all references to filberts to filberts/hazelnuts.

The first change would delete § 982.432 from the rules and regulations. This section describes nomination procedures which independent growers should follow when nominating independent grower members for Board membership. During the formal rulemaking process completed in 1986, § 982.30 was changed to no longer distinguish between independent and cooperative grower members on the Board. Therefore, it is proposed that § 982.432 be deleted as it is unnecessary.

Most of § 982.446, dealing with inspection documentation of restricted filberts/hazelnuts is no longer applicable. The industry no longer uses seals, stamps, or tags as specified in § 982.446(a) to identify product. Rather, the industry uses the identification procedures specified in current § 982.446(c). Therefore, this rule would delete paragraph (a) of § 982.446 from the rules and regulations and § 982.446 would be revised to reflect the current identification procedures contained in paragraph (c).

Paragraphs (b) (1), (2), and (3) of § 982.446 should also be deleted from the rules and regulations because the industry no longer has reason to physically identify stored inshell filberts/hazelnuts as free or restricted filberts/hazelnuts. Currently, filberts/hazelnuts declared as restricted are identified by lot numbers on records kept by handlers. In the past, handlers stored free and restricted filberts/hazelnuts in 100-pound sacks that were labeled free or restricted. Handlers no longer use these sacks. Rather, large bins or cartons are used to store such filberts/hazelnuts. Such designation is easily identifiable in handlers' records.

Section § 982.450 provides procedures for handling restricted filberts/hazelnuts. The Board has recommended that specific form references be inserted in § 982.450 (a), (b), and (c) to identify the forms that handlers are currently required to submit. Under this proposal, references to F/H Form 1d would be added to paragraph (a) of § 982.450, F/H Form 4 would be added to paragraph (b), and F/H Form 1d and F/H Form 7 would be added to paragraph (c).

Paragraphs (a)(1), (a)(2), and (b) of § 982.452 provide procedures for the disposition of restricted filberts/hazelnuts and contain outdated form number references. The Board recommended that these be changed to the new form number references. In paragraph (a)(1) of § 982.452 the form reference would be changed to F/H Form B, and in paragraph (a)(2) the form reference would be changed to F/H Form 7. The form reference for the export agreement between handlers and the Board found in paragraph (b) would be stated as F/H Form A. Paragraph (b) of § 982.452 provides authority for handlers to act as agents of the Board in arranging sales of inshell filberts/

BEST COPY AVAILABLE

hazelnuts into export markets. The Board recommended revising the language of paragraph (b) to reference the provisions of § 982.52(b) of the order. Therefore, the phrase "including those as set forth in § 982.52(b)" would be added to this paragraph if this proposal is adopted. In addition, proposed revisions of paragraphs (a) (1) and (2) of § 982.452 provide gender neutral language.

Handlers are required to be bonded if they intend to defer their withholding obligations under the order into the next season. Section § 982.454 describes the types of bonds accepted by the Board. The Board currently requires handlers to submit F/H Form C to document handlers' use of this provision. Therefore, based on the Board's recommendation, this proposal would add the specific form reference to § 982.454.

Section 982.456 describes procedures for interhandler transfers of filberts/hazelnuts and contains an outdated form reference. Under this proposal, the form reference would be changed to F/H Form 2.

In 1986, § 982.57 of the order was amended to allow growers acting as handlers to sell unlimited quantities of their own production directly to consumers from their orchards, at roadside stands, or at farmers' markets. Quantities of filberts/hazelnuts sold in this manner are exempt from the volume regulation and assessment provisions of the order. Section 982.457 allows handlers to be exempt from certain order requirements (inspection, certification, restricted obligation, assessments, and reporting requirements) if they handle less than 250 pounds of inshell filberts/hazelnuts during any fiscal year. Section 982.457 was originally implemented to allow growers who acted as handlers by selling small quantities of their filberts/hazelnuts directly to consumers to be exempt from the order's regulatory and assessment provisions. Section 982.57, however, now provides authority for growers to sell unlimited quantities of the grower's own production directly to consumers. Therefore, since the 250-pound limitation no longer applies, § 982.457 would be deleted from the rules and regulations.

Section 982.460 provides procedures for transferring excess restricted credits of filberts/hazelnuts and contains outdated form references. The Board recommended that these be changed to the new form references. In paragraphs (b) and (c) of § 982.460, the form reference should be changed to F/H Form 3. In addition, the proposed revision of paragraph (b) would provide gender neutral language.

The Board recommended that § 982.466 include a reference to the complete series of forms currently used. Reference to F/H Forms 1a through 1e should be added to § 982.466. Also, the Board proposed changing the frequency of reports on these forms. The Board has indicated that handlers have found it difficult to submit weekly reports of shipments in October, November, and December (the busiest time of the marketing season) in a timely manner. The Board, therefore, recommended that F/H Form 1a through 1e be submitted once a month, rather than weekly. Accordingly, this change would reduce the information collection requirements subject to the Paperwork Reduction Act, 44 U.S.C. chapter 35. Such reports would include shipment transactions from the beginning of the month to the end of the month. Such reports would be due in the Board office 10 days following the end of the reporting period. The Board indicated that monthly reporting would provide sufficient and timely information essential to the filbert/hazelnut industry. Therefore, this proposal would revise § 982.466 accordingly.

Section 982.468 contains two outdated form references that would be changed to reflect new form references. The outdated form references would be changed to F/H Form 5 and F/H Form 6 in § 982.468. The Board also recommended that the dates of the reporting periods be changed to make them correspond with the Board's marketing year and that provisions be made for the Board to request reports on other duties, with the approval of the Secretary. Section 982.17 of the order was amended in 1986 to change the dates of the marketing year.

Sections 982.453, 982.455, and 982.471 would be revised to change references to "filberts" to "filberts/hazelnuts." The Board recommended that "filbert" be changed to "hazelnuts." The order provides that the term "filberts" means filberts or hazelnuts produced in the States of Oregon and Washington from trees of the genus *Corylus*. However, the Department has proposed substituting the term "filbert/hazelnut" in this rule and in appropriate sections of the rules and regulations. The term "filbert/hazelnut" would accomplish the Board's purpose. It would also avoid the confusion which might occur when the order refers to "filberts" alone and the rules and regulations would refer to "hazelnuts."

Based on available information, the Administrator of the AMS has determined that the issuance of this proposed rule would not have a significant economic impact on a substantial number of small entities.

The information collection requirements contained in the sections of the regulations proposed to be revised have been previously approved by the Office of Management and Budget (OMB) under the provisions of 44 U.S.C. chapter 35 and have been assigned OMB No. 0581–0144.

List of Subjects in 7 CFR Part 982

Filberts/hazelnuts, Marketing agreements and orders, Oregon, and Washington.

For the reasons set forth in the preamble, 7 CFR part 982 is proposed to be amended as follows:

PART 982—FILBERTS/HAZELNUTS GROWN IN OREGON AND WASHINGTON

1. The authority citation for 7 CFR part 982 continues to read as follows:

Authority: Secs. 1–19, 48 Stat. 31, as amended; 7 U.S.C. 601–674.

Subpart—Administrative Rules and Regulations

§ 982.432 [Removed]

2. Section 982.432 is removed.

3. Section 982.446 is revised to read as follows:

§ 982.446 Inspection documentation.

Pursuant to § 982.46(b), handlers are required to use the following identification on bags and cartons of 25 pounds or larger capacity which contain certified filberts/hazelnuts:

(a) The words "This Produce Inspected and Certified Per Federal Marketing Order No. 982" shall be contained within an outline of the combined States of Oregon and Washington; and

(b) This identification shall be printed on the upper right quarter of the printed side of a bag; or

(c) This identification shall be printed on the upper right quarter of one of the side panels of a carton.

4. Section 982.450 is revised to read as follows:

§ 982.450 Application of restricted obligation.

(a) Each handler required to withhold restricted filberts/hazelnuts pursuant to § 982.50 or § 982.51 shall hold such filberts/hazelnuts separate from all other filberts/hazelnuts and shall maintain the identity of each lot so withheld. The restricted product withheld must be reported to the Board on F/H Form 1d, Restricted Inshell Certified.

(b) Each handler making the election pursuant to § 982.50(c) in connection with certified merchantable filberts/hazelnuts which have not been handled, shall thereupon give written notification to the Board on F/H Form 4 of the particular election and of the weight and identity of the filberts/hazelnuts involved.

(c) Pursuant to § 982.50(d), a handler may withdraw from withholding restricted filberts/hazelnuts in excess of his restricted obligation upon advising the Board of the weight and lot identity of the filberts/hazelnuts to be withdrawn. When the quantity of restricted filberts/hazelnuts to be withdrawn from withholding consists of a part of a lot of ungraded filberts/hazelnuts, no part of such lot shall be withdrawn unless the remainder of such lot is reinspected and meets the requirements of § 982.51. Handlers will use F/H Form 1d prior to the end of the marketing year or F/H Form 7 after the end of the marketing year, when reporting the withdrawal of restricted filberts/hazelnuts from withholding status.

5. Section 982.452 is amended by revising paragraph (a)(1) introductory text and paragraph (a)(1) (i)–(iii), (a)(2) and (b) to read as follows:

§ 982.452 Disposition of restricted filberts/hazelnuts.

(a) *Shelling.* (1) Any person desiring to shell restricted filberts/hazelnuts during a fiscal year may do so upon being designated by the Board as an authorized sheller for such year. Application for such designation shall be made in duplicate on F/H Form B and include, in addition to the conditions specified in § 982.52(a), the following: (i) The location of the applicant's shelling operation; (ii) the number of years such person has operated a filbert/hazelnut shelling plant; and (iii) the daily (8-hour) shelling capacity of the plant. * * *

(2) When an authorized sheller completes the shelling of a lot of restricted filberts/hazelnuts, the sheller shall submit a report thereon to the Board on F/H Form 7 showing:

(i) The date shelling was completed;

(ii) The inspection certificate or lot number;

(iii) The quantity shelled;

(iv) The weight of the kernels produced; and

(v) The location where restricted filberts/hazelnuts were held immediately prior to shelling.

(b) *Exports.* Any handler who desires to act as agent of the Board in negotiating export sales of certified merchantable restricted filberts/hazelnuts may do so upon the execution of an "Export Agreement", F/H Form A, wherein the handler agrees, among other things, to negotiate such export sales at not less than such price as the Board may prescribe, and in conformity to and compliance with the other terms and conditions of the Export Agreement including those set forth in § 982.52(b).

6. Section 982.453 is revised to read as follows:

§ 982.453 Disposition of small size filberts/hazelnuts.

Any inshell filberts/hazelnuts that are substandard only because they are small size, as the term "small size" is defined in the Oregon Grades Standards For Filberts in Shell, may be disposed of in export in the same manner and under the same conditions and procedures pursuant to § 982.52(b) for sales in export of certified merchantable restricted filberts/hazelnuts. Such small size filberts/hazelnuts are not eligible for restricted credit.

7. Section 982.454 is revised to read as follows:

§ 982.454 Sureties acceptable to the Board.

Bonds secured by cash, cashier's or certified checks, or by assets that are entirely separate and apart from the handler named in the bond may be accepted by the Board pursuant to § 982.54(a). As a condition of accepting any surety, the Board may require such financial statements or other information relating to the ability of such surety to guarantee a handler's bond as it deems necessary. Handlers are also required to submit F/H Form C to the Board to document the handler's execution of a bond.

8. Section 982.455 is revised to read as follows:

§ 982.455 Exchange of certified merchantable filberts/hazelnuts withheld.

Each handler desiring to exchange filberts/hazelnuts pursuant to § 982.55 shall prior thereto file a written notification with the Board setting forth for the respective quantities of filberts/hazelnuts involved in the exchange, the inspection certificate numbers, quantities, locations, and applicable lot numbers.

9. Section 982.456 is revised to read as follows:

§ 982.456 Interhandler transfers.

Each interhandler transfer of filberts/hazelnuts pursuant to § 982.56 (a) and (c) may be made upon notification to the Board in triplicate by the receiving handler on F/H Form 2 signed by both the transferring handler and the receiving handler which shall include the following information:

(a) Date of transfer;

(b) Names of the transferring and receiving handlers;

(c) Locations between which the filberts/hazelnuts were transferred;

(d) Whether uncertified inshell or certified merchantable;

(e) Net weight of the filberts/hazelnuts transferred, by size and variety;

(f) The inspection certificate, or lot number covering the filberts/hazelnuts; and

(g) If certified merchantable, the name of the handler responsible for compliance with the applicable requirements pursuant to this part relating to such filberts/hazelnuts.

§ 982.457 [Removed]

10. Section 982.457 is removed.

11. Section 982.460 is amended by revising the first sentence in paragraph (b) and revising paragraph (c) to read as follows:

§ 982.460 Transfer of excess restricted credits.

(a) * * *

(b) *Application.* Each handler who has excess restricted credits and desires to transfer them to another handler, may submit such request to the Board on F/H Form 3. * * *

(c) *Transfer.* The Board shall transfer the requested amount of the excess restricted credits from one handler to a designated handler upon receipt of a completed F/H Form 3 together with such information as may be required by the section.

12. Section 982.466 is revised to read as follows:

§ 982.466 Reports of inshell filberts/hazelnuts handled, shelled and withheld.

Each handler shall report to the Board monthly on F/H Form 1 and F/H Forms 1a through 1e, as applicable, the quantities of inshell filberts/hazelnuts handled or withheld for restricted use and all product shelled and certified since the last report. All reports shall be submitted to include transactions through the end of each month, or other reporting periods established by the Board, and are due in the Board office on the tenth day following the end of the reporting period. The quantities of inshell filberts/hazelnuts handled shall be reported by size. The respective quantities of merchantable or ungraded filberts/hazelnuts withheld as restricted product shall be reported separately.

HSTAIC was low; this situation

that we can expedite the HSTAIC-

as legitimately interested in an

and with respect to filberts/hazelnuts certified for shelling, or certified kernels withheld, the kernel weight and inshell equivalent weight shall be reported separately by size.

13. Section 982.468 is revised to read as follows:

§ 982.468 Report of filbert/hazelnut receipts, disposition, and inventory.

On or before January 15 and July 15, or any other date requested by the Board with the approval of the Secretary, each handler shall:

(a) Report to the Board on F/H Form 6 receipts and disposition of inshell filberts/hazelnuts and production of filbert/hazelnut kernels during the respective preceding six-month period of July 1 to December 31, and the preceding 12-month period of July 1 to June 30, and

(b) Report to the Board on F/H Form 5 inventory of filberts/hazelnuts as of January 1 and July 1, respectively, showing the quantities of inshell filberts/hazelnuts separately in terms of certified merchantable, graded uncertified merchantable, restricted, and ungraded.

The certified merchantable filberts/hazelnuts shall be reported on the basis of whether located within or outside the production area and whether or not the restricted obligation has been met.

14. Section 982.471 is revised to read as follows:

§ 982.471 Records.

Each handler shall maintain complete and accurate records showing the receipt, shipment and sale of all filberts/hazelnuts handled, used or otherwise disposed of and shall retain such records for the two-year period prescribed in § 982.71. Handlers shall also maintain a current record of all filberts/hazelnuts held in inventory.

Dated: August 29, 1989.

William J. Doyle,

Acting Deputy Director, Fruit and Vegetable Division.

BILLING CODE 3410-02-M

Animal and Plant Health Inspection Service

9 CFR Part 92

[Docket No. 87-060]

Procedures for Importing Animals Through the Harry S Truman Animal Import Center; Approval of Embarkation Quarantine Facilities

AGENCY: Animal and Plant Health Inspection Service, USDA.

ACTION: Proposed rule.

SUMMARY: We propose to amend the regulations concerning the Harry S Truman Animal Import Center (HSTAIC) to establish more efficient procedures for allocating space in that facility. To help streamline procedures for the use of HSTAIC, we would eliminate provisions for giving multiple importers use of HSTAIC for the same importation. By granting to one importer only the exclusive right to use HSTAIC for the duration of an importation, we would exercise control over importations to an extent otherwise impossible. We are also proposing to establish priorities for granting use of HSTAIC. First, we propose that the Secretary of Agriculture may give priority to applications to use HSTAIC filed by federal agencies for importations of potential value to the general public. We would limit importations by government agencies to one per year. The order in which names of applicants are drawn during an annual lottery would determine the priority given to their applications for use of HSTAIC during the next calendar year. This lottery would consist of four categories, based on the types of animals intended for importation and the disease status of the countries or areas from which the animals would come. The priority list determined by the four-part lottery would determine the order in which we offered applicants the exclusive right to an importation through HSTAIC.

For animals from countries where certain exotic diseases exist, quarantine in an embarkation quarantine facility is used to establish the animals' eligibility for export to the United States, and is prerequisite to quarantine in HSTAIC. To reflect the changing conditions under which importations through HSTAIC now take place, including the geographic range of countries of export, we propose to change the criteria for approving embarkation quarantine facilities, so that one facility would receive Animal and Plant Health Inspection Service approval for a specific quarantine only.

DATE: Consideration will be given only to comments received on or before October 5, 1989.

ADDRESSES: To help ensure that your written comments are considered, send an original and three copies to Chief, Regulatory Analysis and Development, PPD, APHIS, USDA, Room 866, Federal Building, 6505 Belcrest Road, Hyattsville, MD 20782. Please state that your comments refer to Docket Number 87-060. Comments received may be inspected at USDA, Room 1141, South Building, 14th Street and Independence Avenue, SW, Washington, DC, between 8 a.m. and 4:30 p.m. Monday through Friday, except holidays.

FOR FURTHER INFORMATION CONTACT: Dr. Harvey A. Kryder, Senior Staff Veterinarian, Import-Export Products Staff, Veterinary Services, APHIS, USDA, Room 753, Federal Building, 6505 Belcrest Road, Hyattsville, MD 20782, 301-436-8695.

SUPPLEMENTARY INFORMATION:

Background

The regulations in 9 CFR part 92, §§ 92.41 and 92.42 (referred to below as the regulations) set forth the conditions under which importers may qualify animals to enter the United States through the Harry S Truman Animal Import Center (HSTAIC) in Fleming Key, Florida.

When HSTAIC was being planned during the 1960's and 1970's, the importers urging its construction were interested in a quarantine facility for animals being systematically and unconditionally excluded from the United States because of the existence of an exotic disease, such as rinderpest or foot-and-mouth disease, in their country of origin. In particular, those importers focused their attention on cattle. We drafted the original regulations in direct response to market conditions as then understood.

Market conditions have changed during the 1980's, making revision of the regulations imperative. We now receive more applications for importations through HSTAIC of llamas and alpacas, for example, than we do for importations of cattle. Although this does not change the purpose for which HSTAIC was built—to make possible importation of breeds capable of improving domestic livestock production—we propose to meet the changing needs of importers by revising the regulations. The proposed regulations would delete outdated paragraphs 92.41(e) and 92.41(f), concerned with one-time importations of, respectively, water buffalo from Trinidad and llamas and alpacas from Chile.

The original HSTAIC regulations were based on conditions that did not remain fixed. Demand for animals from South America has exceeded that for animals from Europe; interest in llamas, alpacas, and other species has surpassed interest in cattle. Provisions for allocating space in HSTAIC either by lottery or by granting a single importer use of the entire facility have been complicated and confusing. The utilization rate of HSTAIC was low; this situation represented lost opportunities for importers and $25,000-losses to the Federal Government for each month HSTAIC was not being used.

Because the procedures established in the current and suspended HSTAIC regulations (suspension effective September 15, 1987; see 52 FR 35230-35231, Docket Number 87-122) created a situation that did not best serve the public interest, we are proposing a complete revision of those regulations. The alternative ways of applying for space in HSTAIC, previously set forth as "Procedures for special authorization issued on a lottery basis" and "Procedures for special authorization for exclusive use of the HSTAIC," caused, at least in part, some of the key problems associated with HSTAIC importations. Profiting from many years of experience with those problems, we are proposing a single, simpler system, one dependent on fewer variables. This new, streamlined procedure should ensure that only applicants financially prepared to proceed with a proposed importation appear on the HSTAIC priority list; moreover, it would equitably allocate space in HSTAIC, making more than one importation each year feasible in practice as well as one paper.

The involvement of more than one importer in each shipment of animals through HSTAIC inevitably compounds the technical, tactical, and logistical problems presented at any point in the HSTAIC importation process. Coordinating and consolidating arrangements among all the importers attempting to quality their several animals during the same HSTAIC importation, authorized under current § 92.41(a), places great administrative burdens on the Animal and Plant Health Inspection Service. The system is not efficient; delays at every stage of the importation, from negotiating agreements to transporting animals, have been common. Certain problems are inherent in the multifaceted system of testing and quarantine that determines the eligibility of animals for export to, then importation into, the United States: Obtaining documents in foreign countries; construction delays; outbreaks of new strains of contagious diseases cannot be predicted. While we can do nothing about those problems, past example suggests that we can eliminate other problems administratively. In our proposed cooperative-service agreement with the importer, we set terms that would make control of much of the importation process possible. Experience indicates that we can expedite the HSTAIC-importation process by working exclusively with one importer per importation. This practical reality, reinforced by the increasing demand for use of the entire quarantine facility by a single importer, convinced us to propose to discontinue allocating space in HSTAIC on any basis other than "exclusive right to use."

This means that, if the proposed regulations are adopted, we will put the animal quarantine facility at the disposal of one importer alone, the importer with whom we enter into the cooperative-service agreement authorizing the HSTAIC importation. Whether this importer, having been granted the exclusive right the use HSTAIC, includes in his/her importation animals of the same species, belonging to other parties, would be a private matter in which the Animal and Plant Health Inspection Service would not become involved. We would deal exclusively with the importer granted the right to use HSTAIC, who would assume responsibility for all costs (except capital expenditures at HSTAIC) incurred during the importation. The grantee's agreements with other importers would have nothing to do with the terms of the cooperative-service agreement with us. Exclusive responsibility, or liability, would rest with the importer granted the exclusive right to use HSTAIC, as provided in the cooperative-service agreement. This absolute, exclusive financial responsibility assigned to the importer in whose name the cooperative-service agreement was signed would apply under all circumstances, without qualification and without exception.

Capital expenditures at HSTAIC would constitute extraordinary operating costs and, as such, would constitute the sole category of HSTAIC-importation costs assumed by the Animal and Plant Health Inspection Service, and not the importer.

By proposing to require that each application for use of HSTAIC include a substantial deposit—$50,000 by an irrevocable letter of credit—we are attempting to deter persons who might otherwise file applications only because of their nuisance value; persons who, lacking interest or lacking means, would not follow through with an importation. We consider it unlikely that persons not prepared to undertake an importation through HSTAIC would be financially prepared to deposit $50,000 to assume a position on the priority list of prospective importers for as long as 15 months. In the past, applicants had nothing to lose by presenting themselves as legitimately interested in an importation through HSTAIC; as a result, at little cost to themselves, they were able to delay the allocation of space in HSTAIC to the next eligible importer, who in some cases was no longer in a position to proceed with the proposed, legitimate importation. Therefore, in some instances, the facility was underused. We are limiting the method of deposit to an irrevocable letter of credit to minimize the administrative costs to the Animal and Plant Health Inspection Service of managing importations through HSTAIC. Administering deposits in the form of checks or money orders requires more agency resources and staff hours than does administering deposits in the form of irrevocable letters of credit.

Planned importations may fail to materialize for reasons beyond the control of the would-be importer. We are therefore proposing to allow the importer two weeks during which he/she may, without forfeiting his/her deposit, refuse the exclusive right to use HSTAIC being offered to him/her. Upon signing the cooperative-service agreement, however, the importer would become liable for all costs of the animal-qualification process (with the exception of capital expenditures at HSTAIC), with it understood that, by accepting the terms of this cooperative-service agreement, the importer granted the right to use HSTAIC is denying other prospective importers access to the facility, and that whatever happens during the course of the importation will not affect the fixed cost of maintaining the quarantine facility at HSTAIC. During the time the facility is unoccupied, while prospective importers lose opportunities, the Federal Government incurs expenses that, under the current regulations, it cannot recoup. Therefore, we propose to make a change that makes it clear that the importer is liable for all non-capital costs of operating HSTAIC during the period of his/her exclusive right to use the facility. Providing for a nonrefundable deposit would afford us the security of an "insurance policy." Our suspended practice, which required no deposits of this kind, cost the Federal Government hundreds of thousands of dollars (see 52 FR 35230-35231, September 18, 1987, suspending § 92.41(b)). If we do not change it, as we are now proposing to do, economics might force us to stop operating HSTAIC as the only quarantine facility in the United States available to importers of domestic ruminants and swine from countries where certain diseases exist.

Importation by Federal Agencies

From time to time, Federal agencies may require use of HSTAIC to import animals for projects of potential value to a broad sector of the general public. Therefore, we are proposing that the Secretary of Agriculture may give first priority to an application for the exclusive right to use HSTAIC for such an importation. In fairness to other applicants, we would require that, for lotteries held in years other than 1989, each such agency ensure that the Import-Export Animals Staff of Veterinary Services receive its application between the 1st and 15th of the September immediately before the calendar year during which the HSTAIC importation would take place. For the lottery held in 1989, we would publish the time period during which such applications must be received in a final rule in the **Federal Register**. We invite comments concerning the most appropriate time period for accepting such applications. At the time of application, the agency would be required to enter into an interagency agreement with APHIS to deposit $50,000. The application would be submitted in accordance with the procedures established for participants in the annual lottery. An application submitted by a Federal agency at any other time would receive no priority; it would be handled no differently than other "late" applications. We would limit government agency importations to one per year—except when HSTAIC is available and the Import-Export Operations Staff of Veterinary Services has received no other applications for its use during that year—to make it likely that other importers will have access to HSTAIC, even in years in which a government importation is carried out.

The Lottery

The priority allotted to each applicant for the exclusive right to use HSTAIC would be decided by the order in which his/her name were drawn during an annual, four-part lottery. We would draw the name of every eligible lottery applicant during the lottery; every one of those names would appear on the priority list, the waiting list comprising the name of all participants in the annual lottery.

Anyone could obtain the necessary application form from the Import-Export Animals Staff of Veterinary Services, Animal and Plant Health Inspection Service. To enter the lottery, the applicant would have to return this completed form, accompanied by a deposit in the amount of $50,000, to the Import-Export Animals Staff. The deposit would have to be in the form of an irrevocable letter of credit in the applicant's name, and each application would have to be accompanied by a separate letter of credit. For lotteries held in years other than 1989, applications received any time from September 1st through September 15th immediately preceding the annual lottery would qualify for the lottery; applications received at any other time would not be included in the lottery. For the lottery held in 1989, we would publish the time period for receipt of applications in a final rule in the **Federal Register**. We invite comments concerning the most appropriate time period for accepting such applications. Any applications received in 1989 at any time other than during the time period to be published in the **Federal Register** would not be included in the lottery for 1989. The irrevocable letter of credit woudl have to remain in effect until the end of the calendar year of the prospective importation, unless revised as discussed in this document under the heading "Costs."

In years other than 1989, the annual lottery would take place during the first seven days of October. In such years, we would publish a notice providing the exact date, which would vary from year to year, in the **Federal Register** at least 30 days before the lottery. In 1989, we would publish the date of the lottery in a final rule in the **Federal Register**. We invite comments concerning the most appropriate date for conducting the lottery in 1989.

The lottery would have four parts. Animals that are eligible for importation only through HSTAIC, because they are from countries or areas where certain exotic diseases exist, would take precedence over animals from other countries or areas. Also, in accordance with the intent of Congress in approving construction of HSTAIC, cattle, sheep, goats, and swine would take precedence over other animals.

Part one of the lottery would consist of a drawing of the names of applicants proposing to import cattle, sheep, goats, or swine from locations identified in 9 CFR 94.1 as those in which rinderpest or foot-and-mouth disease exists, or proposing to import swine from locations identified in 9 CFR 94.8, 94.9, or 94.12, respectively, as those in which African swine fever exists or the Administrator has reason to believe that it exists, hog cholera is known to exist, or swine vesicular disease is considered to exist. Part two would follow, and would be a drawing of the names of applicants proposing to import llamas, alpacas, water buffalo, camels, or deer or other ruminants susceptible to rinderpest or foot-and-mouth disease and raised under domestic conditions, when these animals are from locations in which rinderpest or foot-and-mouth disease exist. Part three would follow, and would be a drawing of the names of applicants proposing to import cattle, sheep, goats, or swine from locations other than those in which rinderpest or foot-and-mouth disease exists, or proposing to import swine from locations we believe free of African swine fever, hog cholera, or swine vesicular disease. Part four would follow and would be a drawing of the names of applicants proposing to import llamas, alpacas, water buffalo, camels, or deer or other ruminants raised under domestic conditions, from locations other than those in which rinderpest or foot-and-mouth disease exists. (The lottery excludes animals not easily accommodated in the facility, which was structurally designed for ruminants and swine.) All lottery applicants' names would appear on the priority list in sequential order, exactly as they were drawn, with the names drawn during each part taking precedence over those drawn during subsequent parts.

The applicant first on the priority list would receive notification that he/she could proceed with plans for the HSTAIC-importation proposed for the next calendar year. To allow as many importers as possible to use HSTAIC, each importer would be limited to one importation during the period encompassing the calendar year for which the lottery is held and the following calendar year, except when no other lottery participants are prepared to use HSTAIC during the time it would be available those years. Once we have entered into the cooperative-service agreement scheduling the first HSTAIC importation for the year in question, we should be able to guage whether and when we might expect space in HSTAIC to become available for other quarantines during that year. When we believe we can with some confidence predict HSTAIC arrival and release dates—by month if not day—we would be prepared to grant the right to use the facility to the applicant next on the priority list. The number of possible importations per year depends on too many variables for us to authorize more than one importation at the time of the lottery. Nonetheless, we consider it likely that, as in the past, more than one applicant remaining on the priority list would be granted an importation through HSTAIC during the calendar year. Because of this, we propose to

retain all applications for the exclusive right to use HSTAIC until the end of the next calendar year; the priority list established by the lottery would not change. The name of each applicant filing the requisite form, including the deposit, after the deadline for the lottery, would be added, in the order received, to the priority list. However, applicants with priority established by the lottery would always have priority over the late applicants, even if this means granting two HSTAIC importations to a single party. This last case could occur only if no other applicants participated in the lottery or if, having participated, other participants withdrew their applications.

By requesting that his/her deposit be returned, an applicant would automatically remove his/her name from the priority list.

In years other than 1989, we would cancel the annual lottery if we failed to receive more than one application between September 1st and September 15th. In 1989, we would cancel the annual lottery if we failed to receive more than one application during the time period for receipt of applications which would be published in a final rule in the **Federal Register**. In cases where the lottery would be cancelled, we would award the exclusive right to HSTAIC importations for the next calendar year on a first-come, first-served basis. The same conditions would govern any HSTAIC importation we authorized, regardless of how the importer received the grant. At any time during the year, the deposit of $50,000 would have to accompany the completed application form; that application would go directly to the Import-Export Animals Staff; and all other phases of the importation process, described below, would proceed in accordance with these proposed regulations.

Cost

Past problems make it necessary for us to propose requiring advance payment in full of the amount estimated to cover the cost of every importation of animals eligible to enter the United States only after quarantine in HSTAIC. The amount could at best approximate the final cost, because each importation involves variable peculiar to itself. Among these variables: the number of animals the importer intends to qualify for importation, which may not tally with the number actually arriving at HSTAIC; the species of animals; conditions in the country of origin, including all aspects of the quarantine in the embarkation quarantine facility (EQF), when quarantine in an EQF is required; medical treatment; and laboratory tests. With the fact understood that the amount quoted in the cooperative-service agreement represents an approximation only, we propose to require that the importer return that amount with the signed cooperative-service agreement.

Final costs of an importation cannot be calculated until we receive all billings, which can take several months. The exact cost of an importation is not usually known until all bills have passed through our accounting office; this process can usually be completed within 90 days of the end of the quarantine. If the final accounting eventually showed that the importer's advance payment had exceeded costs, we would refund the excess. If it showed that the amount advanced had not covered costs, we would, as before, bill the importer for the amount outstanding. As before, we would require the importer to pay those bills upon receipt.

The importer would submit, with the cooperative-service agreement, the amount due—that is, the estimated cost of the importation less than $50,000 deposit. He/she could remit this in the form of a certified check, a money order, or an increase in the irrevocable letter of credit submitted with the application for importation. Such an increase in the irrevocable letter of credit would have to bear an effective date 90 days after the animal's scheduled release from HSTAIC. Whatever the form of payment, at the time the cooperative-service agreement is submitted, the effective date of the $50,000 letter of credit submitted with the application for importation would have to be revised to extend to 90 days after the animals' scheduled release from HSTAIC. Each cooperative-service agreement would specify the scheduled release date.

Special Circumstances

The Import-Export Animals Staff would not screen the completed applications before the lottery, other than to decide, on the basis of the type and origin of the species specified on the application form, in which part of the lottery to enter the applicant. The first comprehensive review of particulars of a proposed importation would occur only when we were preparing to grant the prospective importer the exclusive right to use HSTAIC. This means that a grantee could unknowingly apply for permission to import animals from a location where officials will not authorize the Animal and Plant Health Inspection Service to proceed in accordance with our regulations. In that case, the animals of choice could not meet the requirements for importation into the United States. We would notify the importer of his/her two options: to withdraw his/her application, or to import animals from another location. In the two weeks allowed for this decisionmaking, the exclusive right to use HSTAIC would take on a provisional status. The ramifications of delaying the schedule by more than two weeks make it necessary for us to propose imposing this deadline on the importer. Time constrains all activity involving HSTAIC, preventing us from introducing more flexibility into our scheduling procedures.

The Cooperative-Service Agreement

We are proposing to revise the agreement that is provided for in the current regulations to reflect the changes discussed elsewhere in this docket. To present its terms more clearly, we propose to revise the format of the agreement, to rewrite it in "Plain English," and to refer to it as a "cooperative-service agreement." These changes are editorial. Also, the agreement in the current regulations holds the "cooperator" liable for costs related to the HSTAIC importation process in two stages. This proposal would replace the two-stage liability system with a provision holding the importer liable for all costs, excluding capital expenditures at HSTAIC, attributable to qualifying animals for and through quarantined in an EQF and HSTAIC. We are proposing to make no other substantive changes, other than to delete provisions inapplicable to the proposed regulations.

Embarkation Quarantine Facility (EQF)

Animals eligible for importation only through HSTAIC must be quarantine in an EQF before being moved to HSTAIC. to reflect the changing conditions under which importations through HSTAIC now take place, we propose to change both the criteria according to which we approve EQF's and some of the specific standards an approved facility must meet.

The current regulations specify that we must approve only one EQF per continent, and only withdraw our approval if the EQF fails to comply with the requirements in § 92.42. When the distance from premises of origin to an EQF was relatively short, curbing transportation costs, that system worked well. Particularly when the animals being quarantined belonged to many importers, rather than to a single importer with the exclusive right to use HSTAIC, establishment of a permanent EQF has practical advantages. When the

---

that nondiscriminatory and reasonable

importation or the species involved, we

number of importers per importation depended on the number of applicants, and when the number of applicants determined the number of animals an individual importer could attempt to qualify for importation, an importation through HSTAIC usually pooled animals from several countries. The permanent presence of an EQF in a third country provided importers with a place for assembling animals in sufficient number to make that joint importation economical. In Europe, the system proved reasonably efficient.

The source of most animals intended for importation through HSTAIC today, however, is South America. Requiring importers with animals originating in Chile or Peru, for example, to use a quarantine facility hundreds of miles away, only because of a regulatory requirement drafted in and for other conditions, serves no purpose. Shipping to a facility in another country on the same continent in fact increases the importer's costs. Further, it additionally complicates the HSTAIC-importation process which, by its nature, is unavoidably variable-dependent. As the number of variables increases, the odds that the importation will go smoothly decrease. We cannot justify requiring the continued use of a single EQF to serve an entire continent when all animals intended for importation through HSTAIC originate in a country able to offer an EQF meeting VS standards.

Granting to a single importer the exclusive right to use HSTAIC would make the original criteria for approving one EQF per continent irrelevant. The importer would assume responsibility for all costs incurred in conjunction with his/her importation; to deny the importer the right to request approval of the EQF of his/her choice would serve no purpose. Therefore, we propose to change the regulations. As proposed, an importer authorized to use HSTAIC would request approval of an EQF, when quarantine in an EQF is required, by submitting site-specific blueprints and location. This information would have to reach the Import-Export Animals Staff at the same time as the completed cooperative-service agreement. After reviewing this information and conducting an on-site inspection, APHIS personnel would approve any proposed facility that meets the requirements of § 92.42(b).

Approval of a facility would expire at the end of the specifically authorized quarantine. Subsequent importers granted use of HSTAIC and proposing to use one of the previously approved EQF's would have to apply for approval in accordance with the procedures prescribed above. By confining approval to a specific importation, we would, we hope, prevent the creation of potentially discriminatory monopolies. To limit the number of variables involved in a single importation, achieving the greatest possible control over contingencies that could undermine or delay shipping the animals to HSTAIC, we propose to approve only one EQF per HSTAIC importation. If for any reasons that facility closes down or loses its "approved" status, the importer would, under the proposed regulations, follow the procedures described above to apply for approval of an alternative facility.

To reflect changing conditions, we propose to remove the requirement that an EQF be located near a dock that services ocean vessels, unless the animals for export are being shipped by sea. More animals today more by air than by sea; accordingly, we would require that the EQF be located near the point of embarkation through which the HSTAIC-bound animals would leave the country. This would probably, but not necessarily, be an airport. Therefore, for flexibility, we would amend the wording of § 92.42(b)(1)(i) and (ii) by replacing the word "docks" with "point of embarkation."

Finally, to ensure that no potential contaminants enter the quarantine facility, we would require that all animal feed come from a location free of foot-and-mouth disease and any other exotic disease necessitating the quarantine or that could jeopardize the quarantine.

We would also make nonsubstantive editorial changes to present the provisions of § 92.42 more clearly.

Executive Order 12291 and Regulatory Flexibility Act

We are issuing this proposed rule in conformance with Executive Order 12291, and we have determined that it is not a "major rule." Based on information compiled by the Department, we have determined that this rule would have an effect on the economy of less than $100 million; would not cause a major increase in costs or prices for consumers, individual industries, Federal, state, or local government agencies, or geographic regions; and would not cause a significant adverse effect on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

This proposed rule would change the procedures according to which we allocate space in the Harry S Truman Animal Import Center. While demand for use of space in that facility, the only one in the United States equipped and authorized to quarantine ruminants and swine from countries where certain exotic diseases exist, continues to exceed HSTAIC's capacity, competition among importers has caused administrative problems. We believe certain potential importers took advantage of the original application process, which they deliberately exploited, proceeding with negotiations solely as a delaying tactic while waiting for the United States Department of Agriculture to recognize countries such as Chile as FMD-free. While they were negotiating, possibly in bad faith, for the exclusive right to an importation through HSTAIC, they prevented importers seriously interested in importing animals from doing so. The regulations exacted no penalty from those applicants who prevented us from scheduling HSTAIC importations. As a result, while HSTAIC stood empty, other importers, as well as the Federal Government and the general public, "paid." Importers denied use of HSTAIC lost the opportunity to compete freely in both foreign and domestic markets. The money of taxpayers covered the cost of maintaining HSTAIC, a cost that should have been borne by the importer authorized to use it.

Having identified the flaws in the original procedures, we are proposing to establish a new system for allocating space in HSTAIC. By requiring all prospective importers to submit deposits of $50,000 with their completed application forms, we are proposing to establish a screening system that should prevent parties who would otherwise submit "nuisance" applications from doing so. Similarly, by making it understood that the $50,000 deposit of an importer granted the exclusive right to use HSTAIC becomes nonrefundable once the cooperative-service agreement is signed, we would ensure that this importer would cover the non-capital costs of maintaining HSTAIC during the planning period, whatever the ultimate outcome.

We are proposing to approve EQF's on a case-by-case basis to accommodate the interests of importers, who may choose to quarantine animals in any facility that meets the standards in our regulations; and to prevent EQF's from being controlled by monopolies. Monopoly control of EQF's would, in practical terms, translate to control of certain HSTAIC importations. Although the current regulations require that the operator of an EQF give permission to use the EQF to any person who has received permission to use HSTAIC, and that nondiscriminatory and reasonable fees be charged for such use, the operator of an EQF could delay importations through HSTAIC by charging fees that are allegedly discriminatory or unreasonable. Even if the Administrator ultimately determines that the fees charged *are* discriminatory or unreasonable, the delays caused could have a negative economic impact on potential importers.

Our intent in proposing to establish a new system for granting importers use of HSTAIC is to ensure that they all compete equally; that our allocation system is the fairest possible. All proposed changes, from the administration of the annual lottery itself to required deposits and clarification of the HSTAIC-importer's responsibilities for all costs (other than capital expenditures at HSTAIC) incurred during every stage of the importation, would work to that end.

Under the proposed regulations, there is no formal provision—as there is under the current regulations—for importers of less than 50 animals to take part in a lottery to assemble an importation of at least 50 animals. However, under the proposed regulations, importers of less than 50 animals could organize independently and arrange to import a total of at least 50 animals in a single importation. Market demand in recent years, however, has indicated virtually no interest in such aggregate importations and has indicated instead increasing demand for exclusive use importations, which under the current regulations have been given priority over importations by lottery. Since 1984, only one lottery has been held—in 1985, for 17 importers and involving a total of 90 animals. On the other hand, in the approximately four years between November, 1984, and December, 1988, HSTAIC has been used for three exclusive use importations, involving 319, 167, and 472 animals, and importers continue to show increasing interest in exclusive use. Thus, with increasing demand for exclusive use, it is market demand that would be the primary limiting factor on importations by small importers, not the proposed changes to the regulations.

Section 92.41(a) of the current regulations requires a deposit of $1,000 per animal from importers being allocated space in HSTAIC under the lottery system. An importer proposing to import 50 animals would, under the regulations now in effect, deposit $50,000, the sum we propose to require of all applicants for use of HSTAIC. While this figure will remain constant, regardless of the size of the proposed importation or the species involved, we expect applicants for the right to a HSTAIC-importation to propose to quarantine considerably more than 50 animals at a time. Our requirement that one importer assume complete responsibility for all non-capital expenditures incurred during the HSTAIC-importation process would not prevent small-scale importers from undertaking an importation in their common interest. However, in accordance with the regulations, the Animal and Plant Health Inspection Service would work exclusively with the importer signing the cooperative-service agreement, regardless of independently reached agreements among importers, or other private business matters involving the importer of record.

Under these circumstances, the Administrator of the Animal and Plant Health Inspection Service has determined that this action would not have a significant economic impact on a substantial number of small entities.

Paperwork Reduction Act

Information collection requirements contained in this document have been approved by the Office of Management and Budget (OMB) under the provisions of the Paperwork Reduction Act of 1980 (44 U.S.C. 3501 *et seq.*) and have been assigned OMB control number 0579–0040.

Executive Order 12372

This program/activity is listed in the Catalog of Federal Domestic Assistance under No. 10.025 and is subject to the provisions of Executive Order 12372, which requires intergovernmental consulation with state and local officials. (See 7 CFR part 3015, subpart V.)

List of Subjects in 9 CFR Part 92

Animal diseases, Canada, Imports, Livestock and livestock products, Mexico, Poultry and poultry products, Quarantine, Transportation, Wildlife.

Accordingly, 9 CFR part 92 would be amended as follows:

PART 92—IMPORTATION OF CERTAIN ANIMALS AND POULTRY AND CERTAIN ANIMAL AND POULTRY PRODUCTS; INSPECTION AND OTHER REQUIREMENTS FOR CERTAIN MEANS OF CONVEYANCE AND SHIPPING CONTAINERS THEREON

1. The authority citation for part 92 would continue to read as follows:

Authority: 7 U.S.C. 1622; 19 U.S.C. 1306; 21 U.S.C. 102–105, 111, 134a, 134b, 134c, 134d, 134f, and 135; 31 U.S.C. 9701; 7 CFR 2.17, 2.51, and 371.2(d).

2. In § 92.41, paragraphs (a) through (f) would be removed, paragraph (g) would be redesignated as paragraph (e), and new paragraphs (a) through (d) would be added to read as follows:

§ 92.41 Requirements for the importation of animals into the United States through the Harry S Truman Animal Import Center

(a) *Exclusive right to use HSTAIC.* The Animal and Plant Health Inspection Service will enter into a cooperative-service agreement with only one importer for each importation through the Harry S Truman Animal Import Center (HSTAIC). An importer granted the exclusive right to use HSTAIC may include in his/her allotted number, animals of the same species belonging to other persons interested in importing animals through HSTAIC. However, the Animal and Plant Health Inspection Service will deal exclusively with the importer in whose name the application for use of HSTAIC was submitted. The Animal and Plant Health Inspection Service will hold this importer solely responsible for all costs (excepting capital expenditures at HSTAIC) incurred during the animal qualification process. HSTAIC can accommodate a finite number of animals at one time, but the maximum allowed for a particular importation will vary, depending on the size of the species; the Animal and Plant Health Inspection Service will specify this figure in the cooperative-service agreement, reproduced in paragraph (d) of this section.

(b) *Scheduling.* Applications for prospective users of HSTAIC are processed according to the following system:

(1) To qualify to use HSTAIC, an importer must submit a completed application,[1] providing estimates when exact information as required on the application form is unavailable. Each application must include a deposit, in the form of an irrevocable letter of credit, in the name of the applicant and in the amount of $50,000, payable to the United States Department of Agriculture, Animal and Plant Health Inspection Service. Each application must be accompanied by a separate irrevocable letter of credit. The irrevocable letter of credit is to remain in effect until the end of the calendar year of the prospective importation, unless revised in accord with the cooperative-service agreement set forth in paragraph (d) of this section. The

---

[1] Application forms are available from, and must be submitted to the Administrator, c/o Import-Export Animals Staff, Veterinary Services, APHIS, USDA, Room 764, Federal Building, 6505 Belcrest Road, Hyattsville, MD 20782.

deposits of all unsuccessful applicants will be cancelled at the end of the calendar year of the prospective importation, or whenever an applicant removes his/her name from the priority list described in paragraph (b)(4) of this section. The deposit of an importer whose application is selected, and who returns a signed cooperative-service agreement accepting the exclusive right to use HSTAIC, is nonrefundable.

(2) In years other than 1989, during the first seven days of October,[2] the Animal and Plant Health Inspection Service will hold a lottery, randomly drawing the names of applicants in an order that will determine the order in which they will be offered use of HSTAIC for an importation during the next calendar year. In 1989, such a lottery will be held [date to be inserted in the final rule]. One application, with deposit, is required for each importation proposed. In years other than 1989, to be included in the annual October lottery, applications must reach the Import-Export Animals Staff, Veterinary Services,[3] no earlier than September 1 and no later than September 15 of that year. In 1989, to be included in the annual lottery, applications must reach the Import-Export Animals Staff, Veterinary Services,[4] no earlier than [date to be inserted in the final rule] and no later than [date to be inserted in the final rule].

(3)(i) The annual lottery will consist of four parts, as follows:

(A) The first part will include the names of applicants proposing to import cattle, sheep, goats, or swine from locations identified in § 94.1 of this chapter as those in which rinderpest or foot-and-mouth disease exists, or proposing to import swine from locations identified in §§ 94.8, 94.9, or 94.12 of this chapter, respectively as those in which African swine fever exists or the Administrator has reason to believe that it exists, hog cholera is known to exist, or swine vesicular disease is considered to exist.

(B) The second part will include the names of applicants proposing to import llamas, alpacas, water buffalo, camels, or deer or other ruminants susceptible to rinderpest and foot-and-mouth disease and raised under domestic conditions, from locations identified in § 94.1 of this chapter as those in which rinderpest or foot-and-mouth disease exists.

(C) The third part will include the names of applicants proposing to import cattle, sheep, or goats from locations not identified in § 94.1, 94.8, 94.9, or 94.12 of this chapter, respectively, as those in which rinderpest or foot-and-mouth disease exists, African swine fever exists or the Administrator has reason to believe that it exists, hog cholera is known to exist, or swine vesicular disease is considered to exist.

(D) The fourth part will include the names of applicants proposing to import llamas, alpacas, water buffalo, camels, or deer or other ruminants raised under domestic conditions, from locations not identified in § 94.1 of this chapter as those in which rinderpest or foot-and-mouth disease exists.

(ii) All names will appear precedence established by the priority of the lottery list, with the order of precedence established by the priority of the lottery part: names drawn in the first part of the lottery would take precedence over those in subsequent parts; names in the second part would take precedence over those in the third and fourth parts, and names in the third part would take precedence over those in the fourth part. The priority list established by the annual lottery will remain effective from January 1 through December 31 of the next calendar year, superseding all previous lists.

(4) In years other than 1989, the names of all applicants whose applications, with deposits, have reached the Import-Export Animals Staff, Veterinary Services,[5] no earlier than September 1 and no later than September 15 (see paragraphs (b)(1) and (6)(2) of this section) will be drawn during the next month's lottery. In 1989, the names of all applicants whose applications, with deposits, have reached the Import-Export Animals Staff, Veterinary Services, no earlier than [date to be inserted in the final rule] and no later than [date to be inserted in the final rule] (see paragraphs (b) (1) and (2) of this section) will be drawn in the annual lottery. The order in which names appear on the priority list will correspond to that established by the lottery. If the person first offered the right to use HSTAIC does not ensure receipt of the cooperative-service agreement by the Import-Export Animals Staff, Veterinary Services, within 14 days of receiving the cooperative-service agreement, the Animal and Plant Health Inspection Service will void that offer, and make an offer to the applicant next on the priority list. The Animal and Plant Health Inspection Service will limit importations to one per importer per the period encompassing the calendar year for which the lottery is held and the following calendar year, except when no other lottery participants are prepared to use HSTAIC during the time it would be available in those years. In years other than 1989, the priority list established during the October lottery will remain in effect during the calendar year following the lottery, and will take precedence over any applications received after September 15th. In years other than 1989, applications received after September 15th will be added to the priority list, with precedence established by the order in which the Import-Export Animals Staff, Veterinary Services, receives them. For the lottery held in 1989, the priority list established during the annual lottery will remain in effect during the calendar year following the lottery, and will take precedence over any applications received after [date to be inserted in the final rule]. In 1989, applications received after [date to be inserted in the final rule] will be added to the priority list, with precedence established by the order in which the Import-Export Animals Staff, Veterinary Services, receives them.

(5) In years other than 1989, if the Import-Export Animals Staff, Veterinary Services, does not receive more than one application between September 1st and September 15, the lottery for that year will be canceled, and the Animal and Plant Health Inspection Service will grant the exclusive right to use HSTAIC for an importation during the next calendar year in the order applications are received. In 1989, if the Import-Export Animals Staff, Veterinary Services, does not receive more than one application between [date to be inserted in the final rule] and [date to be inserted in the final rule], the lottery for 1989 will be cancelled, and the Animal and Plant Health Inspection Service will grant the exclusive right to use HSTAIC for an importation during the next calendar year in the order applications are received.

(6) The Secretary of Agriculture may grant priority over other applications to an application from an agency of the United States government, if for an importation potentially of value to the general public, and if, in years other than 1989, received between September 1 and September 15. The Secretary of Agriculture may grant priority over other applications to an application from an agency of the United States government, if for an importation potentially of value to the general public, and if, in 1989, received between

---

[2] In years other than 1989, the Animal and Plant Health Inspection Service will publish a notice announcing the exact date in the Federal Register at least 30 days in advance of the October drawing.

[3] See footnote 1 in § 92.41(b)(1).

[4] See footnote 1 in § 92.41(b)(1).

[5] See footnote 1 in § 92.41(b)(1).

[date to be inserted in the final rule] and [date to be inserted in the final rule]. However, an agency of the United States government must submit its application in accordance with this section, except that, in lieu of an irrevocable letter of credit, an agency of the United States government must enter into an interagency agreement with the Animal and Plant Health Inspection Service for a deposit of $50,000. HSTAIC importations by agencies of the United States government will be limited to one per year, except when HSTAIC is available and the Import-Export Animals Staff, Veterinary Services, has received no other applications for its use during that year.

(c) *Responsibilities of the Applicant Selected.* By certified mail, return receipt requested, the Animal and Plant Health Inspection Service will send a cooperative-service agreement to the applicant being offered the exclusive right to use HSTAIC, as provided in paragraph (d) of this section. The applicant must, within 14 days of receipt, sign and ensure that the Import-Export Animals Staff, Veterinary Services, receives the cooperative-service agreement, accompanied by a certified check, a money order, or an increase in the irrevocable letter of credit (with an effective date 90 days after the animals' scheduled release date from HSTAIC), for the amount specified in the cooperative-service agreement. The $50,000 deposit required as part of the application will be applied to the quarantine costs, and deducted from the balance due with the cooperative-service agreement. At the time the cooperative-service agreement is returned to the Import-Export Animals Staff, Veterinary Services, the effective date of the $50,000 irrevocable letter of credit submitted with the application for importation must be revised to extend 90 days beyond the animals' scheduled release from HSTAIC. For importations requiring use of an embarkation quarantine facility (EQF), site-specific blueprints and location must be included when the cooperative-service agreement is returned to the Import-Export Animals Staff, Veterinary Services.

(1) An importer interested in animals ineligible for importation because officials in the exporting country or area will not allow the Animal and Plant Health Inspection Service to provide the services prescribed in the cooperative-service agreement, may, upon notification of this ineligibility from the Animal and Plant Health Inspection Service, propose to substitute animals available from another location. If this importer has lost interest, is unable to make alternate arrangements, or for any other reason has not returned the signed cooperative-service agreement within the 14 days specified in the agreement, the Animal and Plant Health Inspection Service will return his/her deposit. In that case, the applicant next in priority will be offered the exclusive right to use HSTAIC, in accordance with the procedures in this section.

(2) The importer may not abrogate his/her responsibility for costs incurred during an importation authorized in his/her name, regardless of any occurrences that, after the signing of the cooperative-service agreement, prevent the importation from proceeding as planned.

(3) The importer signing the cooperative-service agreement returned to the Animal and Plant Health Inspection Service is responsible for paying all costs, excluding capital expenditures at HSTAIC, incurred in qualifying the specified animals for importation through HSTAIC. A partial list of costs for which the importer must assume responsibility includes: Expenses for sentinel animals in the United States, when required, and for tested animals prevented, for any reason, from moving from HSTAIC elsewhere within the United States; laboratory tests; medical treatment; official travel by Animal and Plant Health Inspection Service personnel, including per diem expenses in the country from which animals are being exported, when required; courier services to transport test samples to the Foreign Animal Disease Diagnostic Laboratory, when required; salaries of HSTAIC personnel; all supplies for animal care, maintenance, and testing during the quarantine and in the post-quarantine cleaning and disinfection of HSTAIC; utilities and overhead, including support staff, during the quarantine and post-quarantine cleanup.

(4) Capital expenditures at HSTAIC constitute the only costs for which the importer will not be held responsible.

(5) For costs incurred during any stage of the importation through HSTAIC—that is, costs not calculated into the amount collected from the importer in accordance with the cooperative-service agreement—the Animal and Plant Health Inspection Service will bill the importer at a later date. Payment will be due upon receipt of the bill.

(6) The Animal and Plant Health Inspection Service will return to the importer any money remitted with the cooperative-service agreement set forth in paragraph (d) of this section.

(d) *Cooperative-Service Agreement.* Each importer being granted the right to use HSTAIC must sign, and comply with, the cooperative-service agreement with the Animal and Plant Health Inspection Service. A sample cooperative-service agreement for importers other than agencies of the United States government is reproduced in this paragraph. (Agencies of the United States government being granted the right to use HSTAIC must enter into an interagency agreement with the Animal and Plant Health Inspection Service.) The amount of money the importer must advance, left blank in the following sample, will depend on figures unique to a particular importation. This amount will be specified in the cooperative-service agreement the importer receives.

COOPERATIVE-SERVICE AGREEMENT BETWEEN (NAME OF IMPORTER) AND THE UNITED STATES DEPARTMENT OF AGRICULTURE, ANIMAL AND PLANT HEALTH INSPECTION SERVICE

The importer, ______________, wishes to qualify animals for importation into the United States. The United States Department of Agriculture, Animal and Plant Health Inspection Service, administers the Harry S Truman Animal Import Center (HSTAIC), a facility through which the importer may import animals into the United States.

To effect this importation, both parties agree to the following terms:

The importer agrees:

1. To have this cooperative-service agreement in the office of the Animal and Plant Health Inspection Service's Import-Export Animals Staff, Veterinary Services, within 14 days of the date of receipt, evidenced by the postal return-receipt.

2. To remit with this cooperative-service agreement a certified check, money order, or an increase in the irrevocable letter of credit submitted with the application for importation (with an effective date that extends 90 days beyond the animals' scheduled release from HSTAIC), payable to the United States Department of Agriculture, Animal and Plant Health Inspection Service, in the amount of $________. (This amount represents the estimated cost (except capital expenditures at HSTAIC) of qualifying the animals for importation through HSTAIC, less the $50,000 deposited with the application for the exclusive right to use HSTAIC.)

3. To revise the effective date of the irrevocable letter of credit submitted with the original application for the importation to extend 90 days beyond the animals' scheduled date of release from HSTAIC, if the effective date of the irrevocable letter of credit does not extend 90 days beyond the animals' scheduled date of release from HSTAIC.

4. To limit ______ the number of animals, species ______, transported to HSTAIC for an importation scheduled to begin on or about ______ and to end with the animals' release from HSTAIC, scheduled for ______.

5. To assume liability for all costs (except capital expenditures at HSTAIC) attributable to qualifying animals for and through quarantine in the embarkation quarantine facility (EQF), when quarantine in an EQF is required, and in HSTAIC for importation into the United States. (A partial list of these costs would include expenses for sentinel animals in the United States and for tested animals prevented, for any reason, from moving from HSTAIC elsewhere within the United States; laboratory tests; medical treatment; official travel by Animal and Plant Health Inspection Service personnel, including per diem expenses in the country from which the animals are being exported; courier services to transport test samples to the Foreign Animal Disease Diagnostic Laboratory; salaries of HSTAIC personnel; all supplies for animal care, maintenance, and testing during the quarantine and in the post-quarantine cleaning and disinfection of HSTAIC; utilities and overhead, including support staff, during the quarantine and post-quarantine cleanup.)

6. To obtain from foreign government officials authorizations granting Animal and Plant Health Inspection Service personnel free access to the EQF, when quarantine in an EQF is required, and permits for export.

7. To secure from animal carriers permission for Animal and Plant Health Inspection Service personnel to accompany the animals to the EQF, when quarantine in an EQF is required, and from the EQF to HSTAIC.

8. To maintain and operate the EQF, when quarantine in an EQF is required, in compliance with title 9, part 92, section 42 of the Code of Federal Regulations.

9. To accept as final the findings of the Administrator, Animal and Plant Health Inspection Service, on the animals' eligibility to enter the EQF, when quarantine in an EQF is required, to enter HSTAIC, and to be released from HSTAIC.

10. To follow procedures prescribed by the Animal and Plant Health Inspection Service, appropriate to the disease and pest status of the quarantined animals. (When quarantine in an EQF is required, the presence in the EQF of even one animal either exposed to, or infected with, foot-and-mouth disease, rinderpest, hog cholera, African swine fever, swine vesicular disease, or certain other contagious, exotic diseases, automatically disqualifies all animals in the EQF from entering HSTAIC. Similarly, the presence in HSTAIC of even one animal either exposed to, or infected with, one of the diseases referred to in this paragraph, automatically disqualifies all animals in HSTAIC from moving anywhere within the United States after the period in quarantine.)

11. To assume responsibility for disposal of quarantined animals that do not qualify to move into or within the United States. (In the case of animals disqualified while quarantined in HSTAIC, the Animal and Plant Health Inspection Service will stipulate the conditions under which the disqualified animals in HSTAIC must be destroyed. The importer must, within 10 days of notification from the Animal and Plant Health Inspection Service, remove from the EQF or HSTAIC, animals untreatable or treated for, but not cured of, a communicable disease other than foot-and-mouth disease or any of certain other exotic diseases; those removed from HSTAIC must be moved out of the United States or be destroyed under conditions stipulated by the Animal and Plant Health Inspection Service.)

12. To assume responsibility for all costs the Animal and Plant Health Inspection Service incurs during this importation, excluding capital expenditures at HSTAIC.

13. To pay, upon receipt, post-quarantine billings incurred during this importation, for costs exceeding the amount remitted with this cooperative-service agreement plus the initial $50,000 deposit.

The Animal and Plant Health Inspection Service agrees:

1. To provide the personnel required to perform inspections, laboratory procedures, and examinations, and to provide on-site supervision of the isolation, quarantine, care and handling of animals on premises of origin, in the EQF when quarantine in an EQF is required, and in HSTAIC.

2. To inform the importer of any quarantined animals in the EQF or in HSTAIC that fail to qualify for entry into the United States, and to inform the importer that he/she must assume responsibility for their disposal.

3. To finance capital expenditures at HSTAIC without charging the importer.

4. To account for all money disbursed from the amount remitted, providing the importer with a complete written account upon termination of this cooperative-service agreement.

5. To refund to the importer any part of the amount remitted with this cooperative-service agreement that is not used to cover the non-capital costs of the importation through HSTAIC.

Both parties agree:

1. That this cooperative-service agreement is effective upon signature by both parties.

2. That this cooperative-service agreement will not be signed by the Administrator if the Import-Export Animals Staff, Veterinary Services, Animal and Plant Health Inspection Service, has not received this signed cooperative-service agreement, including the specified remittance for the amount due, by 4:30 p.m. on the fourteenth calendar-day after the date on the United States Postal Service's return receipt, evidencing its receipt by the importer.

3. That this cooperative-service agreement will not be signed by the Administrator if not accompanied by the physical plans for the EQF, including its location and site-specific blueprints (except when quarantine in an EQF is not required).

4. That this cooperative-service agreement will be voided if the Administrator, Animal and Plant Health Inspection Service, determines that the importer has not completed arrangements with the responsible officials in the exporting country by 4:30 p.m. on the date 42 calendar-days after the importer's signing of this cooperative-service agreement.

5. That, if both parties agree in writing, this cooperative-service agreement may be amended.

6. That either party may terminate this cooperative-service agreement upon giving 30 days' written notice to the other party, but premature termination will not relieve the importer of responsibility for costs incurred, as provided in this cooperative-service agreement, nor will it relieve the Animal and Plant Health Inspection Service of responsibility for providing the importer with a complete written accounting of money disbursed from the amounts remitted.

7. That during the performance of this cooperative-service agreement, the importer agrees to be bound by the Equal Employment Opportunity and Nondiscrimination provisions set forth in Exhibit A and the Nonsegregation of Facilities provisions set forth in Exhibit B, which are attached to and made part of this cooperative-service agreement.

8. That no member of, or delegate to, Congress may participate in, or benefit from, this cooperative-service agreement.

Administrator ____________________

Animal and Plant Health Inspection Service, United States Department of Agriculture.

* * * * *

3. In § 92.42, the phrase "approved embarkation quarantine facility" would be amended by revising the phrase to read "embarkation quarantine facility" wherever it appears.

4. In § 92.42, the introductory paragraph, and paragraphs (a)(2), (a)(4), (b)(1) (i) and (ii), and (b)(2)(iv) would be revised to read as follows:

§ 92.42 Embarkation quarantine facility: criteria and standards for approval

Criteria for the establishment of an embarkation quarantine facility outside the United States for the purpose of importing animals into the United States that are eligible for importation only through the Harry S Truman Animal Import Center are as follows:

(a) * * *

(2) To qualify for designation as an embarkation quarantine facility (EQF) for a specifically authorized importation, the facility must meet the requirements of paragraph (b) of this section.

* * * * *

(4) The Animal and Plant Health Inspection Service requires that the importer submit the physical plans for the EQF for which he/she is requesting approval. These plans must include location of facility and site-specific blueprints. The importer must send this information, due with the completed agreement as provided in § 92.41(d) of this part, to the Import-Export Animals Staff, Veterinary Services, Animal and Plant Health Inspection Service, United States Department of Agriculture, Federal Building, 6505 Belcrest Road, Hyattsville, Maryland 20782. The Animal and Plant Health Inspection Service will, after reviewing the importer's plans and conducting an on-site inspection, approve an EQF found to meet the requirements of this section. Approval of an EQF will expire at the end of the specifically authorized quarantine. Subsequent importers granted use of HSTAIC and proposing to use one of the existing EQFs must apply for approval as if for a new facility. No more than one EQF will receive approval for a specific HSTAIC importation. If an EQF closes down or loses its "approved" status for any reason, the Animal and Plant Health Inspection Service may approve a replacement following the method specified in this paragraph.

* * * * *

(b) *Standards for approval of embarkation quarantine facilities*—(1) *Location.* (i) The EQF must be in an area isolated from ruminants, swine, and poultry. It must be located near the point of embarkation: a dock, if the animals will travel by ocean vessel; and airport, if the animals will travel by plane.

(ii) The animals' route from the EQF to the point of embarkation will be limited to areas free of ruminants, swine, and poultry.

* * * * *

(2) *Building.* * * *

(iv) Mesh double screens must protect all open areas, so that insects cannot gain access to the animal holding area. If the animals are removed from the double-screened building before export to the HSTAIC, or if the United States Department of Agriculture Veterinarian in Charge of the quarantine operation determines that insects capable of transmitting communicable animal diseases are entering the animal holding area, the Animal and Plant Health Inspection Service will require implementation of a program of insect vector control. This vector control program will involve treating animals, building interiors, and environs with United States Environmental Protection Agency-registered pesticides. The pesticides must be used in the manner prescribed on the United States Environmental Protection Agency-approved label, and in accordance with the requirements of the government of the country in which the EQF is located.

* * * * *

5. In § 92.42, paragraph (b)(4) would be redesiganted as paragraph (b)(5) and new paragraph (b)(4) would be added to read as follows:

(b) * * *

(4) *Feed.* The animal feed supply in the EQF must consist only of feed obtained from a country or area that is listed as free of foot-and-mouth disease (see § 94.1(a)(2) of this chapter) and any other exotic disease necessitating the quarantine or that could jeopardize the quarantine.

Administrator, Animal and Plant Health Inspection Service.

[FR Doc. 89-20737 Filed 9-1-89; 8:45 am]

BILLING CODE 3410-34-M

DEPARTMENT OF JUSTICE

Drug Enforcement Administration

21 CFR Part 1306

Prescriptions

AGENCY: Drug Enforcement Administration (DEA).

ACTION: Notice of proposed rulemaking.

SUMMARY: This rule proposes to amend the prescription requirements of 21 CFR part 1306 to clarify and facilitate the keeping of prescription information on original dispensing and refills by automated data processing systems. The action is necessary in order to make it easier for persons affected by the regulations to more readily comply with its provisions. The intended effect of the changes is to clarify the requirements to keep automated prescription data for controlled substances and to simplify the requirements to maintain these records.

DATES: Written comments and objections must be received on or before October 5, 1989.

ADDRESSES: Comments and objections should be submitted in quadruplicate to the Administrator, Drug Enforcement Administration, 1405 I Street NW., Washington, DC 20537, Attention: DEA Federal Register Representative/CCR.

FOR FURTHER INFORMATION CONTACT: G. Thomas Gitchel, State and Industry Section, Office of Diversion Control, Drug Enforcement Administration, 1405 I Street NW., Washington, DC 20537, (202) 633-1216.

SUPPLEMENTARY INFORMATION: Section 1306 of title 21 of the CFR concerns the preparation and retention of prescription records for controlled substances.

Section 1306.21 concerns the requirements of a prescription. A new § 1306.21(d) would be added allowing a prescription in Schedule III or IV to be directly entered into a computer system when received by telephone. The regulation requires that the same information which is required for a written prescription be entered into the computer system for those prescriptions received by telephone. When a pharmacy employs a computer system to maintain prescription records, written prescriptions received at the pharmacy must also be entered into the system.

Section 1306.22 concerns the filling and refilling of prescriptions for Schedule III and IV controlled substances, and provides a mechanism for maintaining original dispensing and refill records using an automated data processing system. The proposed rulemaking would amend § 1306.22(b)(1) to allow, with certain provisions, the use of an identity number in place of the name, strength and dosage form of the controlled substance in a computerized system. This, in some cases, would make it more readily compatible with some computerized systems. Section 1306.22(b)(2)(i) would be added requiring a monthly record of original prescription and refill information for Schedules III and IV controlled substances. Section 1306.22(b)(3) would be amended by eliminating the requirement of a daily printout of computerized prescription refills. In its place would be the requirement that the automated data processing systems employed must provide certain security procedures and back-up procedures which are enumerated in the proposed rulemaking. The proposed rule is intended to facilitate the use of computers in documenting prescription transactions and also to provide the necessary security requirements. Section 1306.22(b)(4) would be amended to provide for a printout of the current month's dispensing records of Schedule III and IV controlled substances and extend deadlines. Section 1306.22(b)(5) would be amended to include original, as well as refill, information. Section 1306.22(b)(6) is added to require a back-up copy in the event the original is damaged, destroyed or lost.

Section 1306.26 concerns the transfer between pharmacies of prescription information for Schedule III, IV and V controlled substances for refill purposes. Section 1306.26(c)(3) would be amended to clarify the requirement of an electronic transfer of prescription information.

Section 1306.31 concerns the dispensing of Schedule V controlled substances pursuant to a prescription. The proposed rulemaking would add a new paragraph to require that Schedule V prescriptions and refills be subject to the same requirements as set forth in § 1306.22 for Schedules III and IV

---

controlled substances. There is no change for Schedule V controlled substances dispensed without prescription as authorized in § 1306.32.

The proposed amendments would not require any additional paperwork and are intended to reduce and simplify present requirements. They are intended to alleviate some of the requirements of hard copy records for computerized prescription refills and prescription transfers while at the same time providing adequate security measures to protect against the diversion of controlled substances. Most of these proposed changes in the use of computer systems by pharmacies are being initiated at the request of several of the pharmaceutical groups, who have for some time recommended that DEA update its requirements in this area. The amendments would allow for the original and refill prescription information for Schedule III, IV and V controlled substances received verbally by telephone to be entered directly into the computer system.

The Deputy Assistant Administrator hereby certifies that this proposal will not have significant impact upon small entities whose interest must be considered under the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The changes will not impose any additional regulatory requirements. They will merely revise the method and type of computerized record required to be kept. In addition the changes will significantly reduce paperwork by not requiring a daily printout of computerized refills. They will eliminate the requirement that the pharmacist initial each computerized printout of refill information and in its place provide for other security measures to insure that the pharmacist filling or refilling the prescription can be properly identified.

This action has been analyzed in accordance with the principles and criteria contained in Executive Order 12612, and it has been determined that the proposed rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

Pursuant to section 3(c)(3) and (2)(B) of Executive Order 12291, this proposed action has been reviewed by the Office of Management and Budget.

List of Subjects in 21 CFR Part 1306

Drug traffic control, Prescription drugs.

Pursuant to the authority vested in the Attorney General by 21 U.S.C. 821 and 871(b) which has been delegated to the Administrator of the Drug Enforcement Administration and redelegated to the Deputy Assistant Administrator, Office of Diversion Control, by 28 CFR 0.100 and 0.104, the Deputy Assistant Administrator hereby proposes that 21 CFR part 1306 be amended as follows:

PART 1306—PRESCRIPTIONS

1. The authority citation for part 1306 continues to read as follows:

Authority: 21 U.S.C. 821, 829, 871(b) unless otherwise noted.

2. Section 1306.21 is amended by revising paragraph (a) and adding paragraph (d) to read as follows:

§ 1306.21 Requirement of prescription.

(a) A pharmacist may dispense directly a controlled substance listed in Schedule III or IV, which is a prescription drug as determined under the Federal Food, Drug and Cosmetic Act, only pursuant to a written prescription signed by a prescribing individual practitioner, an oral prescription made by a prescribing individual practitioner and promptly reduced to writing by the pharmacist containing all information required in § 1306.05, except for the signature of the prescribing individual practitioner. In lieu of promptly reducing an oral prescription to writing, it may be directly entered into an automated data system pursuant to the requirements of § 1306.22.

* * * * *

(d) An original prescription received via the telephone for a controlled substance in Schedule III or IV which is directly entered into a computer system, as described in § 1306.22, must be designated as an original prescription in the computer system. The original prescription must be entered into the system by the pharmacist or designated person receiving the prescription. The number of authorized refills along with the information required by § 1306.22 must also be entered into the computer system. A written prescription received by a pharmacist is required to be maintained at the pharmacy for a period of two years and is subject to the requirements of § 1304.04. A pharmacy utilizing a computer system must also enter into the computer system the information on a written prescription including the number of refills, the fact that it is an original prescription and the information required by § 1306.22.

3. Section 1306.22 is amended by revising paragraphs (b) introductory text, (b)(1), (b)(3), (b)(4), and (b)(5) and adding paragraphs (b)(2)(i), (b)(2)(ii) and paragraph (b)(6) to read as follows:

§ 1306.22 Refilling of prescriptions.

* * * * *

(b) As an alternative to the procedures provided by § 1306.21 and paragraph (a) of this section, an automated data processing system may be used for the storage and retrieval of original and refill information for prescription orders for controlled substances in Schedules III and IV, subject to the following conditions:

(1) Any such proposed computerized system must provide on-line retrieval (via CRT display or hard-copy printout) of original prescription order information. This shall include, but is not limited to, data such as the original prescription number, date of issuance of the original prescription order by the practitioner, name and address of the patient, name, address, and DEA registration number of the practitioner, the name, strength, dosage form, quantity of the controlled substance prescribed (and quantity dispensed if different from the quantity prescribed), the total number of refills authorized by the prescribing practitioner and the name or initials of the dispensing pharmacist. A unique numeric identifier (such as an N.D.C. number) may be used in place of the name, strength and dosage form, as long as the computerized system has the capability of replacing this unique identifier with the name, strength and dosage form for each original prescription and refill. When requested by an authorized official of the Administration or other authorized official, the information must be provided by name, strength and dosage form.

(2) * * *

(i) At the end of each month a record shall be generated which documents all original prescriptions and refills of Schedule III and IV controlled substances dispensed during that month. This record must separate the original and refill information for Schedule III and IV controlled substances prescriptions from other prescriptions in the same data system. This record shall include, but is not limited to: the prescription number, date of issuance, name and address of the patient, name, address and DEA registration number of the practitioner, initials of dispensing pharmacist, and the name, strength, dosage form, quantity of the controlled substance prescribed (and quantity dispensed if different from the quantity prescribed).

(ii) The monthly printouts must be provided upon request from an authorized official of the Administration or other authorized official. These records shall be maintained in accordance with § 1304.04.

(3) Accuracy and completeness of the original and refill information entered into an automated system must be verified each time by the individual pharmacist who fills an original prescription or refill order for a Schedule III or IV controlled substance, i.e., thorough check of data screen prior to actual entry into the database. The system employed must be designed to protect against unauthorized access to, and use of, the automated system and associated data and be able to identify the pharmacist filling the original prescription or refill. Such protection shall be accomplished as follows:

(i) Each authorized pharmacist shall be assigned a unique access code of three or more characters to be entered prior to each and every original prescription, refill order or any edit of data, i.e., the automated system shall prompt the user for this unique code each and every time an original prescription or refill, or edit of data is entered in the computer system. Such code when entered shall not visibly appear on the screen. This will insure that the code is not compromised by onlookers.

(ii) Such access codes shall automatically cause the initials of the pharmacist assigned the code to appear within the appropriate data field and become part of the original prescription or refill order.

(iii) The knowledge or ability to change, delete or add assigned access codes shall be strictly limited. (For example, the owner, pharmacy manager, corporate security officer, or other authorized and appropriate individual.)

(4) Any such computerized system shall have the capability of producing a printout for the current month's original and refill data for Schedule III and IV prescriptions. Such a printout must include all the information required by paragraphs (b)(1) and (b)(2) of this section. This printout must be produced upon request of an authorized official of the Administration or other authorized official. In any computerized system employed by a user pharmacy which utilizes a central recordkeeping facility, as permitted by 21 CFR 1304.04, the central recordkeeping location must be capable, if requested, of producing and delivering the requested printout to the pharmacy within three working days. Such requests can be made by an authorized official of the Administration or other authorized official.

(5) In the event that a pharmacy which employs such a computerized system experiences system down-time, the pharmacy must have an auxiliary procedure which will be used for documentation of originals and refills of Schedule III and IV controlled substance prescription orders. This documented auxiliary procedure must provide assurance that refills are authorized by the original prescription order, that the maximum number of refills has not been exceeded, and that all of the appropriate data is retained for on-line data entry as soon as the computer system is available for use again.

(6) A back-up copy of original prescription and refill information must be made daily for that day's transactions. The back-up copy can be stored on hard disk, floppy disk, or magnetic tape in lieu of a printed medium. The copy must be stored on an entirely separate storage medium distinct from the operating medium normally utilized and kept two years from the transaction date.

4. Section 1306.26 is amended by revising paragraph (c) to read as follows:

§ 1306.26 Transfer between pharmacies of prescription information for Schedules III, IV and V controlled substances for refill purposes.

* * * * *

(c) Prescriptions can be electronically transferred on a one-time basis provided that:

(1) The electronic transfer contains the information required on a prescription and refill by § 1306.22 (b)(1) and (b)(2)(i).

(2) A system is devised where the pharmacy transferring the prescription can no longer refill the prescription once it is transferred to another pharmacy.

(3) A system is devised in the automated data system that will prevent subsequent transfers to other pharmacies in the network.

* * * * *

5. Section 1306.31 is amended by revising the heading to the section and adding paragraph (d) to read as follows:

§ 1306.31 Schedule V controlled substances dispensed on prescription.

* * * * *

(d) A pharmacy which employs an automated data system in filling or refilling a prescription for a Schedule V controlled substance shall comply with the requirements of § 1306.22 regarding the filing and retrieval of prescription information. Criteria that apply to Schedule III and IV prescriptions also apply to Schedule V prescriptions.

Dated: July 28, 1989.

Gene Haislip,

Deputy Assistant Administrator, Office of Diversion Control.

BILLING CODE 4410-09-M

DEPARTMENT OF THE INTERIOR

Office of Surface Mining Reclamation and Enforcement

30 CFR Part 943

Abandoned Mine Land Reclamation Program

AGENCY: Office of Surface Mining Reclamation and Enforcement (OSMRE), Interior.

ACTION: Request for public comment.

SUMMARY: Governor Clements of the State of Texas notified the Office of Surface Mining Reclamation and Enforcement (OSMRE) by letter, dated May 11, 1989, that the State had addressed the last known abandoned mine area having coal-related problems; and further, the State has adequate funds for any unforeseen coal problems that might arise during the life of the Abandoned Mine Land Reclamation (AMLR) program. Having satisfied the requirements of the Act in regard to abandoned coal mine reclamation, the State of Texas requests certification to proceed with noncoal reclamation projects as provided for under section 409 of title IV of the Surface Mining Control and Reclamation Act of 1977 (Pub. L. 95-87, 30 U.S.C. 1202 et. seq.).

This notice sets forth the times and locations for the public to submit written comments or to meet and discuss the request with OSMRE representatives or request public meetings.

DATES: OSMRE will accept written comments on the request until 4:30 p.m. c.s.t. on October 5, 1989.

Upon request, OSMRE will hold a public hearing on the request on September 25, 1989, beginning at 9:00 a.m. c.s.t. The public hearing will be held at the location shown under "**ADDRESSES**" below.

OSMRE will accept requests for a public hearing until 4:30 p.m. c.s.t. on September 20, 1989. If no person has contacted OSMRE by that date to express an interest in testifying at the hearing, it will be cancelled. If only one person requests an opportunity to speak at the public hearing, a public meeting, rather than a hearing, may be held and the results of the meeting included in the Administrative Record.

ADDRESSES: Written comments should be mailed to the Office of Surface Mining Reclamation and Enforcement, Tulsa Field Office, 5100 E. Skelly Drive, Suite 550, Tulsa, Oklahoma 74135, or hand-delivered to the same address.

If requested, a public hearing will be held at the Tulsa Field Office of the

Office of Surface Mining Reclamation and Enforcement, 5100 E. Skelly Drive, Suite 550.

Requests for a public hearing should be made by contacting the individual listed under "**FOR FURTHER INFORMATION CONTACT.**"

Copies of the Texas AMLR program and the request for certification are available for inspection Monday through Friday, 8:30 a.m. to 4:00 p.m. excluding holidays, at the following addresses:

Railroad Commission of Texas, Surface Mining and Reclamation Division, 1701 N. Congress, Austin, Texas 78701; Telephone (512) 463–6900.
Office of Surface Mining Reclamation and Enforcement Administrative Record Room 5315, 1100 L. Street NW., Washington, DC 20240.
Office of Surface Mining Reclamation and Enforcement Tulsa Field Office, 5100 E. Skelly Drive, Suite 550, Tulsa, Oklahoma 74135; Telephone: (918) 581–6430.

FOR FURTHER INFORMATION CONTACT: Mr. James H. Moncrief, Director, Tulsa Field Office, Office of Surface Mining Reclamation and Enforcement, 5100 E. Skelly Drive, Suite 550, Tulsa, Oklahoma 74135; Telephone: (918) 581–6430.

SUPPLEMENTARY INFORMATION:

I. Background

Title IV of the Surface Mining Control and Reclamation Act (SMCRA) of 1977, Pub. L. 95–87, 30 U.S.C. 1201 et seq., establishes an Abandoned Mine Land Reclamation (AMLR) program for the purposes of reclaiming and restoring lands and water resources adversely affected by past mining. This program is funded by a reclamation fee imposed upon the production of coal. Lands and water eligible for reclamation are those that were mined or affected by mining and abandoned or left in an inadequate reclamation status prior to August 3, 1977, and for which there is no continuing reclamation responsibility under State or other Federal laws.

Each State having within its border coal-mined lands eligible for reclamation under title IV of SMCRA may submit to the Secretary of the Interior a State Reclamation Plan demonstrating its capability for administering an AMLR program. Upon approval of the State Reclamation Plan by the Secretary, the State may submit to OSMRE on an annual basis an application for funds to be expended in that State on specific reclamation projects that are necessary to implement the approved State reclamation plan. Such annual requests are reviewed and approved by OSMRE in compliance with the requirements of 30 CFR part 886.

AMLR funds are to be utilized to address the problems caused by past mining in the following order. First, reclamation efforts are to be directed at correcting or mitigating the problems caused by past coal mining. Certain noncoal mining-related problems may also be addressed at the same time if they involve direct threats to the public health and safety. Second, following the completion of all coal-related impacts, a State program may then direct its efforts to alleviating the problems caused by all other types of mining. Finally, when all coal and noncoal related impacts have been addressed, and if certain other conditions set forth in section 402(g) (2) of SMCRA are satisfied, AMLR funds may be used for construction of specific public facilities in communities impacted by coal mining development.

The Texas Reclamation Plan, as submitted on April 24, 1980, and amended on May 30, 1980, June 2, 1980 and June 4, 1980, was approved effective June 23, 1980 (45 FR 41940). Since this approval, the State has received OSMRE approval of four coal reclamation projects at a total cost of $6.1 million. In addition, OSMRE has approved two noncoal reclamation grants involving seven sites at a cost of $0.47 million. Currently, Texas has approximately $14 million in State share funds that have been allocated to the State but not granted for abandoned mine land (AML) reclamation. In addition, there are more than $3 million in unappropriated funds in the State's share of the AML fund.

II. Discussion of Proposed Action

The Governor of the State of Texas notified OSMRE by letter on May 11, 1989 (Administrative Record No. TAML–40), that the State has reclaimed all known and related problems eligible for funding under section 404 of SMCRA and has committed funds to address any unforeseen coal problems that might arise.

Once a State has reclaimed all lands adversely impacted by past coal mining, SMCRA provides that a State may utilize its AMLR funds to address eligible problems caused by noncoal mining. OSMRE is seeking public comments and information concerning any known or suspected unreclaimed lands and water resources in the State that may have been adversely affected by coal mining practices prior to August 3, 1977, and for which there is no continuing reclamation responsibility under State or other Federal laws.

If no past coal mining problems eligible for funding under section 404 of SMCRA are identified through this process, the Secretary is authorized to allow the State to address noncoal problems as set forth in 30 CFR part 875. Such noncoal reclamation activities, however, may occur with one condition; that is, if a coal problem occurs or is identified some time in the future, the State must seek immediate funding for reclaiming that problem. In the event of certification by the Secretary, the State has agreed to this condition.

To assist in its analysis of Texas' grant application and the proposed plan for funding future coal-related problems, OSMRE solicits comments on all relevant economic, environmental, and legal issues involving the reclamation of lands adversely affected by past coal mining practices and the State's request to fund eligible noncoal projects.

BILLING CODE 4310–05–M

DEPARTMENT OF DEFENSE

Department of the Navy

32 CFR Part 775

Procedures for Implementing the Procedural Provisions of the National Environmental Policy Act

AGENCY: Department of the Navy.

ACTION: Proposed rule with request for comments.

SUMMARY: The Department of the Navy is proposing to revise its regulations for implementing procedural provisions of the National Environmental Policy Act. This proposed rule is in compliance with 40 CFR part 1507 which requires each federal agency to adopt, as necessary, procedures supplementing regulations published by the Council on Environmental Quality.

DATES: Agency and public comments concerning this proposed rule are requested to be sent to the address given below and to be postmarked no later than October 5, 1989.

ADDRESSES: Comments concerning this regulation may be mailed to: Mr. Thomas J. Peeling, Special Assistant for Environmental Planning, Office of the Deputy Chief of Naval Operations (Logistics), Room 10N67, Hoffman Bldg. II, 200 Stovall St., Alexandria, Virginia 22332–2300.

FOR FURTHER INFORMATION CONTACT: Thomas J. Peeling, telephone (202) 325–7344/0521.

SUPPLEMENTARY INFORMATION: The National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4321–4361 (1976)) establishes national policy and goals for protection of the environment. Section 102(2) of NEPA contains certain procedural requirements directed toward the attainment of such goals. In particular, all federal agencies are required to give appropriate consideration to the environmental effects of their proposed actions in their decisionmaking and to prepare detailed environmental statements on recommendations or reports significantly affecting the quality of the human environment.

Executive Order 11991 of May 24, 1977, directed the Council on Environmental Quality (CEQ) to issue regulations to implement procedural provisions of NEPA. Accordingly, CEQ issued final NEPA regulations (40 CFR parts 1500–1508) on November 29, 1978, which are binding on all federal agencies as of July 30, 1979.

These regulations require each federal agency, as necessary, to adopt implementing procedures to supplement the CEQ regulations. Section 1507.3(b) of the CEQ regulations identifies those sections of the regulations which must be addressed in agency procedures.

This proposed rule would revise Department of the Navy procedures (32 CFR part 775) for compliance with NEPA and the CEQ regulations. The last several years of NEPA compliance has provided substantial experience in reviewing project impacts and to better determine which types of projects do not have the potential, either individually or cumulatively, for significant environmental impacts. Based on that experience, the proposed revisions consist primarily of changes to the list of categorical exclusions contained in § 775.6(c). The entire part 775 is presented here for clarity and continuity.

For the reasons set out in the preamble, it is proposed that, title 32, chapter VI, subchapter G, of the Code of Federal Regulations be amended by revising part 775 to read as follows:

PART 775—PROCEDURES FOR IMPLEMENTING THE NATIONAL ENVIRONMENTAL POLICY ACT

Sec.
775.1 Purpose.
775.2 Scope.
775.3 Policy.
775.4 Responsibilities.
775.5 Classified actions.
775.6 Planning considerations.
775.7 Time limits for environmental documents.
775.8 Scoping.
775.9 Documentation and analysis.
775.10 Relations with state, local and regional agencies.
775.11 Public participation.
775.12 Action.

Authority: 5 U.S.C. 301; 42 U.S.C. 4321–4361; 40 CFR Parts 1500–1508.

§ 775.1 Purpose.

To supplement Department of Defense (DOD) regulations by providing policy and assigning responsibilities to the Navy and Marine Corps for implementing the Council on Environmental Quality (CEQ) regulations (40 CFR parts 1500–1508) implementing procedural provisions of the National Environmental Policy Act (NEPA).

§ 775.2 Scope.

The policies and responsibility assignments of this rule apply to the Office of the Secretary of the Navy, the Navy Department, and the Navy and Marine Corps operating forces and shore establishment. This rule is limited to the actions of these elements with environmental effects in the United States, its territories, and possessions.

§ 775.3 Policy.

(a) The Department of the Navy (DON) must act with care to ensure, to the maximum extent possible, that in conducting its mission of providing for the national defense, it does so in a manner consistent with national environmental policies. In so doing, the Navy recognizes that the NEPA process includes the systematic examination of the likely environmental consequences of implementing a proposed action. To be an effective decisionmaking tool this process will be integrated with other Navy-Marine Corps project planning at the earliest possible time. This ensures that planning and decisionmaking reflect environmental values, avoid delays, and avoid potential conflicts. Care must be taken to ensure that, consistent with other national policies and national security requirements, practical means and measures are used to protect, restore, and enhance the quality of the environment, to avoid or minimize adverse environmental consequences, and to attain the objectives of:

(1) Achieving the widest range of beneficial uses of the environment without degradation, risk to health and safety, or other consequences that are undesirable and unintended;

(2) Preserving important historic, cultural, and natural aspects of our national heritage, and maintaining, where possible, an environment that supports diversity and variety of individual choice;

(3) Achieving a balance between resource use and development within the sustained carrying capacity of the ecosystem involved; and

(4) Enhancing the quality of renewable resources and working toward the maximum attainable recycling of depletable resources.

(b) The DON shall:

(1) Assess environmental consequences of proposed actions that could affect the quality of the environment in the United States, its territories, and possessions in accordance with DOD and CEQ regulations;

(2) Use a systematic, interdisciplinary approach that will ensure the integrated use of the natural and social sciences and environnental considerations in planning and decisionmaking where there may be an impact on man's environment;

(3) Ensure that presently unmeasured environmental amenities are considered in the decisionmaking process;

(4) Consider the reasonable alternatives to recommended actions in any proposal that would involve unresolved conflicts concerning alternative uses of available resources;

(5) Make available to states, counties, municipalities, institutions, and individuals advice and information useful in restoring, maintaining, and enhancing the quality of the environment; and

(6) Use ecological information in planning and developing resource-oriented projects.

§ 775.4 Responsibilities.

(a) The Assistant Secretary of the Navy for Shipbuilding and Logistics (ASN(S&L)) shall;

(1) Advise the Secretary of the Navy on DON policy regarding NEPA compliance and communications with foreign governments concerning environmental matters and/or other arrangements/investigations coordinated through the Department of State.

(2) Be the principal point-of-contact with the CEQ, Environmental Protection Agency (EPA), the Deputy Assistant Secretary of Defense for Environment (DASD(E)), other DOD components and federal agencies concerned with NEPA matters, and with private environmental groups as applicable.

(3) Direct and/or, upon recommendation, approve the preparation of Environment Impact Statements (EIS) to the EPA and to other appropriate agencies for review and comment.

(4) Approve and forward to the Navy Judge Advocate General (JAG) Findings of No Significant Impact (FONSI) for publication in the **Federal Register** for those actions of national concern that the Navy/Marine Corps has determined will not have a significant effect on the quality of the human environment and for which an EIS will not be prepared.

(5) Approve and forward to the Navy JAG, for publishing in the **Federal Register**, a Record of Decision (ROD) which will summarize for the public record the decision made by the Navy/Marine Corps among the alternatives presented in a Final EIS.

(6) Maintain liaison with the Chief of Information who will coordinate with the Assistant Secretary of Defense (Public Affairs) those environmental matters which have significant public affairs implications.

(7) Maintain liaison with the Office of Legislative Affairs who will coordinate with the Assistant Secretary of Defense (Legislative Affairs) and the Congress those environmental matters which have significant legislative implications.

(b) The Chief of Naval Operations, or his designee, and the Commandant of the Marine Corps, or his designee, are responsible, within their respective services, for NEPA compliance, which includes;

(1) Implementing DON policy regarding protection of the environment to include NEPA compliance.

(2) Advising commands in cases of necessity of the requirement for submitting environmental assessments or impact statements.

(3) Coordinating as appropriate with CEQ, EPA, DASD(E), ASN(S&L), and other DOD components and federal agencies concerned with environmental matters.

(4) Serving as the point of contact for DON environmental matters.

(5) Coordinating, as appropriate, with the Chief of Information for the release to the public of environmental assessments, impact statements, Findings of No Significant Impact, and other environmental documents, according to the Freedom of Information Act and other applicable federal laws.

(6) Providing assistance for actions initiated by private persons, state or local agencies and other non-DON/DOD entities for which DON involvement may be reasonably foreseen.

(7) Identifying major decision points in the chain of command where environmental effects shall be considered.

(8) Ensuring that relevant environmental documentation accompanies all proposals for action through the appropriate review process so that such information is available to the decision maker.

(c) The Chief of Naval Operations and the Commandant of the Marine Corps are to comply with this instruction by subsequently directing subordinates to:

(1) Ensure all appropriate instructions, directives, and orders include the requirement for funding and planning for environmental documentation, as required;

(2) Conduct analyses of the environmental effects of current and proposed actions in accordance with DOD regulations, CEQ regulations (40 CFR parts 1500–1506), and other applicable regulations;

(3) Encourage, to the extent practicable, citizen participation in environmental evaluations of projects or programs;

(4) Evaluate environmental impacts at initial planning stages and at each following significant step or decision milestone in the development of a project or program, as warranted.

§ 775.5 Classified actions.

(a) The fact that a proposed action is of a classified nature does not relieve the proponent of the action from complying with NEPA and the CEQ regulations. Therefore, environmental document shall be prepared, safeguarded and disseminated in accordance with the requirements applicable to classified information. When feasible, these documents shall be organized in such a manner that classified portions are included as appendices so that unclassified portions can be made available to the public.

(b) It should be noted that a classified EA/EIS serves the same "informed decisionmaking" purpose as does a published unclassified EA/EIS. Even though the classified EA/EIS does not undergo public review and comment, it must still be part of the information package that is placed before the decisionmaker for the proposed action. The content of a classified EA/EIS (or the classified portion of a public EA/EIS) will therefore meet the same content requirements applicable to a published unclassified EA/EIS.

§ 775.6 Planning considerations.

(a) When integrating the NEPA process into early stages of proposed actions, action proponents will determine as early as possible the appropriate level of documentation required under NEPA, i.e., is the action a major federal action significantly affecting the human environment requiring an environmental impact statement (EIS), is the action one for which the impacts are not known or which may not be significant and, therefore, an environmental assessment (EA) is appropriate, or is the action one that has no potential for significant impacts and can be categorically excluded from further NEPA documentation.

(b) The command responsible for preparation of the appropriate documentation may prepare an EA on any action at any time in order to assist in planning and decisionmaking, including the decision whether or not to prepare an EIS. If a determination is made based on information presented in an environmental assessment that an EIS is not required, a Finding of No Significant Impact (FONSI) will be prepared and made available to the public in accordance with CEQ regulations (40 CFR 1506.6).

(c) CEQ regulations provide for the establishment of categorical exclusions (40 CFR 1508.4) for those actions which do not individually or cumulatively, under normal circumstances, have a significant effect on the human environment and for which, therefore, neither an EA nor an EIS is required. "Normal circumstances" is intended to denote the absence of extenuating site specific conditions such as the absence of wetlands, endangered or threatened species, historic/archaeological resources, and/or hazardous wastes. The presence of extenuating circumstances will usually preclude use of a categorical exclusion and, therefore, require preparation of an EA or EIS. Categorical exclusions are justified for those kinds of Navy actions which minimally affect the quality of the human environment, do not result in any significant change from existing conditions at the site of the proposed action, and those whose effect is primarily economic or social. The following are actions which, under normal conditions, are categorically excluded from further documentation requirements under NEPA:

(1) An action the effects of which are included in a previous EA or EIS and for which site specific constraints and/or mitigation measures described in the NEPA decision documents (i.e., FONSI or ROD) will be incorporated.

(2) Routine personnel, fiscal, and administrative activities involving military and civilian personnel, e.g., recruiting, processing, paying, and records keeping.

(3) Reductions in force wherein impacts are limited to socioeconomic factors.

(4) Routine movement of mobile assets, such as ships and aircraft, in home port reassignments (when no new support facilities are required) to perform as operational groups, and/or for repair and overhaul.

(5) Relocation of personnel into existing federally-owned or commercially-leased space which does not involve a substantial change in the supporting infrastructure (e.g., an increase in vehicular traffic beyond the capacity of the supporting road network to accommodate such an increase).

(6) Emergency activities when immediate action is required for protection of lives, and for public health and safety. Emergency situations requiring action by naval authorities which could result in significant harm to the environment shall be reported to CNO (OP-04E)/CMC (LFL) who will facilitate consultation with the CEQ.

(7) The preparation of policy and planning documents, e.g., activity master plans and natural resources management plans.

(8) Studies, data and information-gathering that involve no physical change to the environment, e.g., topographic surveys, bird counts, wetland mapping, forest inventories, and timber cruising.

(9) Routine repair and maintenance of facilities and equipment in order to maintain existing operations and activities, including maintenance of improved and semi-improved grounds such as landscaping, lawn care, and minor erosion control measures.

(10) Alteration of and additions to existing structures to conform or provide conforming use required by new or existing applicable legislation or regulations, e.g., hush houses for aircraft engines and scrubbers for air emissions.

(11) Routine actions normally conducted to operate, protect, and maintain Navy-owned and/or controlled properties, e.g., maintaining law and order, physical plant protection by military police and security personnel, and pest management activities on improved and semi-improved lands conducted in accordance with applicable federal and state directives.

(12) New construction that is consistent with existing land use and, when completed, the use or operation of which complies with existing regulatory requirements, e.g., a building on a parking lot with associated discharges/runoff within existing handling capacities.

(13) Procurement activities that provide goods and support for routine operations.

(14) Day-to-day manpower resource management and research activities that are in accordance with approved plans and inter-agency agreements and which are designed to improve and/or upgrade Navy ability to manage those resources.

(15) Continuing actions and facility function when there is no substantial change from previously existing conditions.

(16) Training exercises on military property, and properties under land use agreement, when all applicable environmental and natural resources conservation factors have been incorporated into the exercise plan.

(17) Decisions to close facilities, decommission equipment, and/or temporarily discontinue use of facilities or equipment (where such equipment is not used to prevent/control environmental impacts). Note: Does not apply to permanent closure of public roads.

(18) Contracts for activities conducted at established laboratories and plants, to include contractor-operated laboratories and plants, within facilities where all airborne emissions, waterborne effluents, external radiation levels, outdoor noise, and solid and bulk waste disposal practices are in compliance with existing applicable federal, state, and local laws and regulations.

(19) Identification, characterization, and clean-up of hazardous sites/materials when such actions are in accordance with applicable laws and the procedural aspects for execution involve the public in the decisionmaking process.

(20) Routine movement, handling and distribution of materials, including hazardous materials/wastes that when moved, handled, or distributed are in accordance with applicable regulations.

(21) Demolition, disposal, or improvements involving buildings or structures not on or eligible for listing on the National Register of Historic Places and when in accordance with applicable regulations.

(22) Acquisition, installation, and operation of utility and communication systems, data processing cable, and similar electronic equipment which use existing rights of way, easements, distribution systems, and/or facilities.

(23) Renewals and/or initial real estate ingrants and outgrants involving existing facilities and land wherein use does not change significantly. This includes, but is not limited to, existing federally-owned or privately-owned housing, office, storage, warehouse, laboratory, and other special purpose space.

(24) Grants of license, easement, or similar arrangements for the use of existing rights-of-way or incidental easements complementing the use of existing rights-of-way for use by vehicles; electrical, telephone, and other transmission and communication lines; water, wastewater, stormwater, and irrigation pipelines, pumping stations, and facilities; and for similar utility and transportation uses.

(25) Transfer of real property from the Navy to another military department or to another federal agency, and the granting of leases (including leases granted pursuant to the agricultural outleasing program), permits and easements where there is no significant change in land use or where subsequent land use would otherwise be categorically excluded.

(26) Disposal of excess easement interests to the underlying fee owner.

(27) Renewals and minor amendments of existing real estate grants for use of government-owned real property where no significant change in land use is anticipated.

(28) Pre-lease exploration activities for oil, gas or geothermal reserves, e.g., geophysical surveys.

(29) Return of public domain lands to the Department of the Interior.

(30) Land withdrawal continuances or extensions which merely establish time periods and where there is no significant change in land use.

(31) Temporary closure of public access to Navy property in order to protect human or animal life.

(32) Engineering effort undertaken to define the elements of a proposal or alternatives sufficiently so that the environmental effects may be assessed.

(33) Actions which require the concurrence or approval of another federal agency where the action is a categorical exclusion of the other federal agency.

(34) Maintenance dredging and debris disposal where no new depths are required, applicable permits are secured, and disposal will be at an approved disposal site.

(35) Installation of devices to protect human or animal life, e.g., raptor electrocution prevention devices, fencing to restrict wildlife movement onto airfields, and fencing and grating to prevent accidental entry to hazardous areas.

(36) Natural resources management actions undertaken or permitted pursuant to agreement with or subject to regulation by federal, state, or local organizations having management

responsibility and authority over the natural resources in question, including hunting or fishing during hunting or fishing seasons established by state authorities pursuant to their state fish and game management laws.

(37) Approval of recreational activities which do not involve significant physical alteration of the environment or increase human disturbance in sensitive natural habitats and which do not occur in or adjacent to areas inhabited by endangered or threatened species.

(38) Routine maintenance of timber stands, including issuance of down-wood firewood permits, hazardous tree removal, thinning and salvage operations, prescribed burning, and planting and seeding.

(39) Reintroduction of endemic or native species (other than endangered or threatened species) into their historic habitat.

§ 775.7 Time limits for environmental documents.

(a) The timing of the preparation, circulation, submission and public availability of environmental documents is important in achieving the purposes of NEPA. Therefore, the NEPA process shall begin as early as possible in the decisionmaking process.

(b) The EPA publishes a weekly notice in the **Federal Register** of environmental impact statements filed during the preceding week. The minimum time periods set forth below shall be calculated from the date of publication of notices in the **Federal Register**. No decision on the proposed action may take place until the later of the following dates:

(1) Ninety days after publication of the notice of availability for a draft environmental impact statement (DEIS). Draft statements shall be available to the public for 15 days prior to any public hearing on the DEIS (40 CFR 1506.6(c)(2)).

(2) Thirty days after publication of the notice of availability for a final environmental impact statement (FEIS). If the FEIS is available to the public within ninety days from the availability of the DEIS, the minimum thirty day period and the minimum ninety day period may run concurrently. However, not less than 45 days from publication of notice of filing shall be allowed for public comment on draft statements prior to filing of the FEIS (40 CFR 1506.10(c)).

§ 775.8 Scoping.

As soon as practicable after the decision to prepare an EIS is made, an early and open process called "scoping" shall be used to determine the scope of issues to be addressed and to identify the significant issues to be analyzed in depth related to the proposed action (40 CFR 1501.7). This process also serves to deemphasize insignificant issues, narrowing the scope of the EIS process accordingly (40 CFR 1500.4(g)). Scoping results in the identification by the proponent of the range of actions, alternatives, and impacts to be considered in the EIS (40 CFR 1508.25). For any action, this scope may depend on the relationship of the proposed action to other existing environmental documentation.

§ 775.9 Documentation and analysis.

(a) Environmental documentation and analyses required by this rule should be integrated as much as practicable with any environmental studies, surveys and impact analyses required by other environmental review laws and executive orders (40 CFR 1502.25). When a cost-benefit analysis has been prepared in conjunction with an action which also requires a NEPA analysis, the cost-benefit analysis shall be integrated into the environmental documentation.

(b) CEQ regulations encourage the use of tiering whenever appropriate to eliminate repetitive discussions of the same issues and to focus on the actual issues ripe for discussion at each level of environmental review (40 CFR 1502.20). Tiering is accomplished through the preparation of a broad programmatic environmental impact statement discussing the impacts of a wide ranging or long term stepped program followed by narrower statements or environmental assessments concentrating solely on issues specific to the analysis subsequently prepared (40 CFR 1508.28).

(1) *Appropriate use of tiering.* Tiering is appropriate when it helps the lead agency to focus on issues which are ripe for decision and exclude from consideration issues already decided or not yet ripe. (40 CFR 1508.28(b)). The sequence of statements or analyses is:

(i) From a broad program, plan, or policy environmental impact statement (not necessarily site specific) to a subordinate/smaller scope program, plan, or policy statement or analysis (usually site specific) (40 CFR 1508.28 (a)).

(ii) From an environmental impact statement on a specific action at an early stage (such as need and site selection) to a supplement (which is preferred) or a subsequent statement or analysis at a later stage (such as environmental mitigation) (40 CFR 1508.28(b)).

(iii) *Preparation of the Programmatic Enviromental Impact Statement.* In addition to the discussion required by these regulations for inclusion in environmental impact statements, the programmatic environmental impact statement shall also discuss:

(A) A description of the subsequent stages or sites that may ultimately be proposed in as much detail as presently possible,

(B) All of the implementing factors of the program that can be ascertained at the time of impact statement preparation,

(C) All of the environmental impacts that will result from establishment of the overall program itself that will be similar for subsequent stages or sites as further implementation plans are proposed,

(D) All of the appropriate mitigation measures that will be similarly proposed for subsequent stages or sites.

(iv) *Preparation of the Tiered analysis.* The analytical document used for stage or site specific analysis subsequent to the programmatic environmental impact statement shall also be an environmental impact statement when the subsequent tier itself may have a significant impact on the quality of the human environment or when an impact statement is otherwise required. Otherwise, it is appropriate to document the tiered analysis with an environmental assessment to fully assess the need for further documentation or whether a FONSI would be appropriate.

§ 775.10 Relations with state, local and regional agencies.

Close and harmonious planning relations with local and regional agencies and planning commissions of adjacent cities, counties, and states, for cooperation and resolution of mutual land use and environment-related problems should be established. Additional coordination may be obtained from state and area-wide planning and development "clearinghouses". These are agencies which have been established pursuant to Executive Order 12372 of 1982. The clearinghouses serve a review and coordination function for Federal activities and the proponent may gain insights on other agencies' approaches to environmental assessments, surveys, and studies in relation to any current proposal. The clearinghouses would also be able to assist in identifying possible participants in scoping procedures for projects requiring an EIS.

§ 775.11 Public participation.

The importance of public participation in preparing environmental assessments shall be recognized (40 CFR 1501.4(b)). In determining the extent to which public participation is practicable, the following are among the factors to be weighed by the command preparing the environmental documentation:

(a) The magnitude of the environmental considerations associated with the proposed action;

(b) The extent of anticipated public interest; and

(c) Any relevant questions of national security classification.

§ 775.12 Action.

The Chief of Naval Operations and the Commandant of the Marine Corps shall, each, as appropriate:

(a) Provide guidelines and procedures for administrative direction and implementation of this rule and CEQ regulations; and,

(b) Maintain a focal point for the coordination of the preparation of environmental assessments and impact statements.

Dated: August 29, 1989.

Sandra M. Kay,

Department of the Navy, Alternate Federal Register Liaison Officer.

BILLING CODE 3810-AE-M

FEDERAL EMERGENCY MANAGEMENT AGENCY

44 CFR Part 353

RIN 3067–AB49

Fee for Services in Support, Review and Approval of State and Local Government or Licensee Radiological Emergency Plans and Preparedness

AGENCY: Federal Emergency Management Agency.

ACTION: Proposed rule; extension of comment period.

SUMMARY: This action extends the time allotted for review and comment of FEMA's proposed rule, 44 CFR part 353, published in the **Federal Register** on Thursday, June 29, 1989 (54 FR 27390). The extension is until September 11, 1989. The rule proposes to establish a fee for services the agency provides in the review and approval of State and local government or licensee site-specific offsite radiological emergency plans and preparedness for commercial nuclear power plants. These services are provided pursuant to Presidential Directive and Memorandum of Understanding between FEMA and the Nuclear Regulatory Commission (NRC). FEMA's services contribute to the emergency preparedness requirements needed for the NRC's licensing purposes under the Atomic Energy Act of 1954, as amended. The proposed fees are based on site-specific costs incurred by FEMA's Radiological Emergency Preparedness (REP) Program and related site-specific litigation costs associated with the NRC licensing process as a result of FEMA's support, review and approval of offsite radiological emergency plans and preparedness. The proposed fees are applicable to the full range of situations involving emergency planning, preparedness and response, including emergency response planning by a utility.

DATE: Comments must be received on or before September 11, 1989.

ADDRESS: Comments should be mailed to Rules Docket Clerk, Office of General Counsel, Room 840, 500 C Street SW., Washington, DC 20471. They may be transmitted to the Clerk by facsimile at 202–646–4536.

FOR FURTHER INFORMATION CONTACT: Vernon Adler, Acting Chief, Program Development Branch, Technological Hazards Division, Washington, DC (202) 646–2854.

Dated: August 30, 1989.

Dennis H. Kwiatkowski,

Assistant Associate Director, Office of Natural and Technological Hazards.

BILLING CODE 6712-01-M

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Parts 17 and 23

Proposed Policy on Giant Panda Permits

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of proposed policy for issuance of permits for giant pandas; request for comments.

SUMMARY: The U.S. Fish and Wildlife Service (Service) announces a proposed policy for issuance of permits for the import of giant pandas. Existing regulations and guidelines would be clarified with respect to new information for situations involving issuance of permits for giant pandas. Specifically, restrictions on animals intentionally removed from the wild for exhibition loans would continue. Only female pandas 2 years to under 4 years and males 2 years to under 5 years at the start and conclusion of a loan

BEST COPY AVAILABLE

period, respectively, and those over 18 years old would typically be considered for temporary exhibition loans, and then only if funds committed in the loan agreement are used for specific projects designed primarily to enhance the survival of the giant panda. The Service would be supportive of the use of captive animals when the loan or permanent transfer is likely to enhance the captive-breeding population. Furthermore, the basis for findings required by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (Convention) on "primarily commercial purposes" and the "suitability of facilities" are clarified and conditioned in the proposed policy.

DATES: The Service will consider comments received by October 5, 1989, before announcing a final decision on this proposed policy.

ADDRESSES: Comments may be submitted to the Office of Scientific Authority, Mail Stop: Arlington Square Building, Room 725, U.S. Fish and Wildlife Service, Washington, DC 20240. Materials received will be available for public inspection from 8:00 a.m. to 4:00 p.m., Monday through Friday, at the Office of Scientific Authority, Arlington Square Building, Room 750, 4401 Fairfax Drive, Arlington, Virginia.

FOR FURTHER INFORMATION CONTACT:

Scientific Authority Findings—Dr. Charles W. Dane, Office of Scientific Authority, U.S. Fish and Wildlife Service, Washington, DC 20240, telephone (703) 358–1708.

Management Authority Findings—Mr. Marshall P. Jones, Office of Management Authority, U.S. Fish and Wildlife Service, Washington, DC 20240, telephone (703) 358–2093.

Permit Issuance—Mr. Richard K. Robinson, Office of Management Authority, U.S. Fish and Wildlife Service, Washington, DC 20240, telephone (703) 358–2093.

SUPPLEMENTARY INFORMATION:

Background

The survival and ultimately the increase of the giant panda *(Ailuropoda melanoleuca)* is the strong desire of the United States, the People's Republic of China, and the international conservation community.

Since 1983, natural calamities, especially the die-off of certain bamboo populations (the giant panda's principal food), have threatened the survival of the giant panda. The people and the Government of the People's Republic of China (PRC) have undertaken significant efforts to save the panda and to restore its habitat. This has generated interest and support of people and conservation organizations worldwide, and perhaps has also generated the interest in panda loans that are now a point of concern.

There are believed to be fewer than 1,000 giant pandas remaining in the wild. These animals occur in many fragmented populations, only a few of which consist of as many as 50 pandas. Poaching of pandas and loss of their habitat continues. Finally, there are fewer than 100 pandas in captivity, and breeding programs have not yet resulted in a self-sustaining captive population.

Last year, proposals for temporary exhibition loans of giant pandas became an increasingly controversial issue. The giant panda is subject to strict U.S. and international protection by its listing as an endangered species under the U.S. Endangered Species Act (Act), and its inclusion in Appendix I to the Convention. The Service is responsible for regulating panda loans to the United States by deciding whether to grant the import, export, and re-export permits required by the Act and the Convention. The Service believes that its existing regulations and guidelines under the Act and the Convention have been sufficient for panda import and re-export permit decisions made to date.

However, the Service has received reports that as many as 30 additional institutions may have been negotiating with various entities in the People's Republic of China to arrange panda loans, potentially posing additional threats to the wild and captive populations of the species. Since a large percentage of the institutions that may seek loans are from the United States, the Service must carefully evaluate new information as it relates to existing regulations and guidelines to ensure that its permitting actions continue to meet the specific issuance criteria presented later in this section. The Service announced the initiation of this reevaluation in the June 24, 1988, **Federal Register** (53 FR 23847).

Responses to this announcement were received from the International Primate Protection League (League), the Chairman of the Panda Task Force (Task Force) for the American Association of Zoological Parks and Aquariums (AAZPA), and Mr. C.P. Kanoles. With regard to specific recommendations, Mr. Kanoles commented on the purposes for which import would be allowed, emphasized the need for adequate facilities and resources for long-term care, and suggested that a numerical import quota be established.

The League expressed concern about the stress resulting from travel and changes in diet and water, and the possibility that the large amount of funds provided to China could lead to removal of additional animals from the wild. The League also thought that the policy should apply to other species; the golden monkey was referred to elsewhere in their letter.

The Task Force (1) suggested that the AAZPA mandatory standards and the International Union for Conservation of Nature and Natural Resources (IUCN) resolution provisions should be incorporated in the guidelines, (2) asked that general guidance be provided on long-term loans but that specific criteria be considered separately, (3) suggested that a registry of all specimens be provided, (4) indicated that female pandas over 3 to 4 years should not be loaned, but were equivocal on loans of male pandas, suggesting consideration of the individual male's previous contribution to the genetic diversity of the species might be a basis for allowing loans, (5) supported the idea that any animal being loaned should be captive-born, (6) recommended that resources provided to activities in China under the loan agreement should be for tasks on a "prioritized list of panda conservation-research projects", and (7) indicated that the Task Force was not in favor of a quota system.

Furthermore, comments on most of the above topics were provided during a meeting with representatives of the World Wildlife Fund and AAZPA, where the finding on "primarily commercial purposes" was also discussed.

The U.S. Fish and Wildlife Service is reviewing available information and present policies to ensure that those loans that are permitted will not be harmful to the survival of the species. The PRC Ministry of Forestry is developing management plans for panda reserves, and the Chinese Association of Zoological Gardens is making a concerted effort to coordinate and strengthen the captive breeding program for pandas in China. The proposed U.S. policy presented herein was developed to provide all involved and interested parties with the Service's understanding of issues that it considers important to ensure that loans will not have a detrimental effect on the species and will contribute to specific activities most likely to enhance the propagation or survival of the species. The June 24, 1988, **Federal Register** notice referred only to short-term exhibition loans, since recent loans have been of this type. However, this proposed policy also addresses long-term loans for breeding

purposes because these loans also may have significant effects on the species.

Before any import permit can be granted, it must be reviewed in terms of the applicable requirements of the Convention and the Act by the Service's Offices of Scientific and Management Authority. Issuance of an import permit under the Convention requires prior findings that: (1) The import would not be for purposes detrimental to the survival of the species; (2) the import would not be for primarily commercial purposes; and (3) the permit applicant could suitably house and care for the animals. Issuance of a permit under the Act requires prior determinations that, among other things: (1) The import would be for scientific purposes or to enhance the propagation or survival of the species, in a manner consistent with the purposes and policies of the Act; and (2) issuance of the import permit would not be likely to jeopardize the continued existence of the species. These requirements are further implemented by application requirements and issuance criteria found in 50 CFR 17.21, 17.22, 23.14, and 23.15.

With regard to making the first findings listed above under both the Convention and the Act, the issue is to determine whether the loss of breeding potential as a result of a loan is offset by specific enhancement features in order to allow determinations that the import will be for purposes that are not detrimental and that will enhance the survival of the species. The second determination listed above under the Act (that the action would not be likely to jeopardize the continued existence of the species) would, of course, also have to be made.

Relationship of Age to Reproductive Potential

In general, the Service believes that animals of breeding age that are already in captivity should be maintained in captive-breeding programs. Therefore, the Service would not support loans of breeding age animals even during the non-breeding season unless the loans are clearly in support of creating breeding opportunities, except for special situations discussed elsewhere in this guidance. There are at least two potentially detrimental effects of loans on panda breeding programs. The first is the effect on reproductive potential of the loaned animals, and the second is the effect on genetic representation in future generations of the animals being loaned.

It is most important to include currently captive, breeding age animals in breeding programs to allow for maximum production and to maximize opportunities to ensure that genetic lines are represented in the next generation. Females may first breed when 5 or 6 years old (and the Sichuan Province's Department of Forestry has indicated that females may breed as early as 4½ years old), and males when 6 years old. Recent information indicates that the movement and loan of animals during the non-breeding season may disrupt the breeding cycle aswell as affect the socializationprocess among potential mates, which appears necessary for successful natural matings. Animals approaching breeding age may be similarly affected. Therefore, any young females involved in exhibition loans should typically be returned to breeding situations by the time they are 4 years old, and males, which mature slightly later, by 5 years of age.

There is still uncertainty regarding the relative importance of natural matings, and therefore of the importance of males in captive breeding. One view is that females in strong estrus will always accept natural mating by a suitable companion male, and because the conception rate resulting from natural matings is almost 100 percent, these situations should be encouraged. The Service's proposed policy is based on this view. The Service's position might be modified if new data become available that indicate otherwise.

Young animals do not achieve independence until about 1½ years of age, and therefore no pandas would be permitted to enter the United States until they are 2 years old. While there will always be some risk to individual pandas, along with the possibility that loans of pandas over 2 but less than 4 years (or 5 years for males) may affect subsequent breeding, these risks are acceptable if specific beneficial management projects are part of the total import application; i.e., if the possible loss of breeding potential is offset by possible benefits from specific projects designed to enhance the propagation or survival of the species. There does not seem to be any reason, however, why either young or old animals cannot be loaned to more than one location during the time that the individual panda is in the United States.

At least some individual pandas may breed up to at least 18 years of age, although they may live until they are at least 25 years old. Presently, there is no upper age that can be set to assure that a panda is not capable of breeding. However, older animals are less likely to be capable of reproduction. Allowing the use of older animals for loans should also provide greater assurance that offspring representing their genetic lines have been produced. Of course the movement of any animals of this age could increase the risk of mortality. Nevertheless, with regard to older animals the proposed policy would typically treat the loan of older animals as not likely to detract from the breeding program, and the Service would usually accept the increased risk of mortalities because of offsetting enhancement projects associated with management plans. Therefore, the Service would generally permit the use of pandas 18 years old and older for short-term loans. The loan of an animal for which evidence definitively establishes that the animal is not capable of breeding would be considered on a case-by-case basis. Aggressive or incompatible behavior, or low sperm count would not be acceptable as the sole basis for meeting this part of the proposed policy.

As an aid to the coordinated management of individual animals that may be in a breeding program, a registry or family file, as these records are called in China, should be kept current and available. A coordinated registry presumably is or would be maintained by the Chinese Association of Zoological Gardens. A studbook with additional information, including parentage and relatedness, as well as a species survival plan, including designation of "founder" animals, are also important for management of a captive population. However, for the purpose of issuing permits, the name, sex, location, birth date (or estimated age if the animal was formerly rescued from the wild), and birthplace of all pandas that may be involved in loans should be documented in a registry or family file, available to all involved parties from the PRC Ministry of Forestry (the Management Authority for the Convention for the People's Republic of China), or from the Management Authority of any other exporting country. This procedure would also be consistent with the desire and intent of the Chinese to expand their captive management of this species. Certification of age and sex and a listing of distinctive or identifying markings of the specific animal(s) involved in a loan would also be documented on the export license or permit.

Conservation Benefits of Specific Projects

Management plans to enhance the survival of the panda in the wild are being developed by the People's Republic of China for each of the panda reserves, as well as an overall national plan for panda conservation, and we understand that these plans will identify the highest priority projects that may contribute the most to the enhancement or survival of the species in the wild. Furthermore, there are some projects related to the captive population that may enhance the propagation, hence survival, of the species in captivity, such as development of a studbook, significant relocation of the animals for breeding purposes and, under special circumstances (i.e., where actually needed for animals already in captivity), the creation or renovation of breeding facilities. Final discussions on management plans for the panda reserves were held in October 1988. Plans were developed and are awaiting final approval by the Chinese Government. Meetings have also been held with the Chinese Association of Zoological Gardens regarding captive propagation and research, and the establishment of a studbook or registry. High priority projects identified in the panda reserve and national management plans or appropriate captive breeding programs, preferably certified by the PRC Ministry of Forestry to the U.S. Management Authority, would be accepted as offsetting the possible effect of loans of pandas of the ages previously discussed. In order to determine whether the activities associated with the loan will enhance the propagation or survival of the species, as required by the Act, the applicant usually must include descriptions of projects to be funded in China. In addition to projects related to panda reserves and national management plans, projects to support loans or the permanent transfer of captive pandas designed to move animals into captive breeding programs would also be considered in deciding whether the enhancement criteria have been met. Finally, the Service would identify the specific projects to which resources would be committed by the applicant as part of the **Federal Register** notice for an endangered species permit application.

Determination of Whether Import is for Primarily Non-Commercial Purposes

With regard to the determination of whether a short-term exhibition loan of giant pandas is primarily for non-commercial purposes, the Service proposes the following clarification of policy:

(a) Resolution Conf. 5.10 of the Conference of the Parties to the Convention establishes that the nature of the transfer between the owner in the country of export and the recipient in the country of import may be commercial. It is the intended use of the specimens in the country of import that must be primarily non-commercial, and it is the responsibility of the recipient country's Management Authority to make this determination. The resolution further establishes that there may be some commercial aspects of that use, but that other non-commercial uses must be predominant in order to be deemed primarily non-commercial.

(b) To date, all successful applicants have been public, nonprofit institutions. The Service's general regulations at 50 CFR 10.12 define "public" institutions as those that * * * "are open to the general public and are either established, maintained, and operated as a government service, or are privately endowed and organized but not operated for profit." Governmental agencies and nonprofit conservation organizations will likewise receive consideration if they meet a similar test.

(c) It is the Service's policy that funds raised by a public institution or organization (as defined above) that are retained (but not primarily considered as expenses) by the organization(s) or institution(s) involved in arranging for the loan, are to be used entirely to further the stated objectives and programs for which the institution or organization was established. All such excess funds retained by the importer must be used for non-commercial purposes. At least some of these excess funds must be used for the conservation of the giant panda, as well as for other endangered species and for the general conservation of fauna, flora, and other natural resources.

Collection of revenues by the importing institution, either for its own use or for the use of other organizations, for purposes other than described above, would be judged to be a primarily commercial activity, as would the use of revenues for profit-making purposes.

Suitability of Facilities

With regard to whether the recipient of a short-term panda loan would be suitably equipped to house and care for the pandas, the Service believes that there is sufficient information available that, if followed, would ensure the safety of the pandas and the viewing public. It should be noted that pandas, as is the case with other bears, can be dangerous. Applicants considering exhibiting giant pandas should consult with at least two other facilities that have successfully held pandas in recent years, and should have plans that address the National Zoological Park's recommended measures for giant panda care and facilities. Applicants should provide a statement that these reviews have taken place and that the necessary features for maintaining and exhibiting pandas have or will be incorporated into their facilities and program, and that zoo staff involved in the care of pandas, especially the keepers, have had proper training. This statement would be expected in addition to the presently required layout and drawings of facilities and resumes of all those responsible for caring for the pandas. Furthermore, it has been customary for the Chinese involved with the loan to inspect the facilities to assure themselves that the facilities are suitable. If a permit is issued prior to inspection by the Chinese, its validity would be conditional pending their approval. The Service may also inspect the facility, and if it deems the facilities unsuitable the permit would not be issued unless or until the situation is corrected to the Service's satisfaction.

Response to The Secretariat's Views

The Service notes the Secretariat's recommendation that all giant panda exhibition loans should be undertaken in accordance with the provisions of Article III of the Convention, with no exemptions for "pre-Convention" animals (those that came into captivity prior to December 6, 1983). Therefore, if the management authority of the country of origin or of the country of re-export does not issue a pre-Convention certification, the Service will require a U.S. import permit and an export permit or reexport certificate, as appropriate, from the exporting country in accordance with Article III of the Convention.

The Secretariat also expressed concern that the increase in zoo exhibition loans will lead to the taking of more specimens from the wild. The Service will continue its policy of not allowing short-term loans of pandas when the possibility of import may contribute to the removal of pandas from the wild. Therefore, because the number of loans and financial incentives have increased in the last few years, no exhibition loan permits would typically be issued for animals removed from the wild after December 30, 1986. The Secretariat's concern regarding loans of breeding age animals and loans where the noncommercial purposes do not clearly predominate were addressed earlier in this document.

Summary of Proposed Policy for Panda Loans

1. Age of Animals

Loans (unless they clearly involve the movement of animals in support of creating breeding opportunities) should involve animals old enough to be

independent of maternal care, but not yet of breeding age or approaching breeding age, so as to minimize disruption of any captive breeding programs. Specifically, the following animals would be considered:

(a) Females at least 2 years old at the start of a loan period, and under 4 years at its conclusion;

(b) Males at least 2 years old at the start of a loan period, and under 5 years at its conclusion;

(c) Animals of either sex that are 18 years or older;

(d) Case-by-case consideration of individuals where evidence establishes that animal(s) is incapable of breeding.

2. Registry of Animals

Information about animals involved in a loan should be documented in a registry or family file available from the P.R.C. Ministry of Forestry, and they should be certified as to their age and sex, with any distinctive or identifying marks indicated, on the export license or permit.

3. Projects to Conserve the Species

Permit applications for temporary exhibitions usually must include descriptions of projects to be funded in China. These projects should be designed to implement high priority tasks from Chinese panda reserve and national management plans or appropriate captive breeding programs (preferably with supporting information from the China Management Authority if available), and should be certified by the P.R.C. Ministry of Forestry. Projects to support loans or permanent transfers of pandas into captive breeding programs would also be considered in deciding whether the enhancement criteria have been met.

4. Use of Funds for Non-commercial Purposes

The application should clearly demonstrate the noncommercial purposes of the proposed loan for each institution or organization that will have access to any part of revenues generated from the loan. Specifically, each organization or institution should demonstrate that it will use its share of funds to further its stated nonprofit objectives, and that these objectives will contribute primarily to the conservation of giant pandas and other endangered species, but may also contribute to other species of fauna and flora or other natural resource values.

5. Suitability of Facilities

Applicants should demonstrate that they have consulted with at least two other facilities that have successfully held pandas in recent years, that they have facility designs that address the National Zoological Park's recommended measures for giant panda care and facilities, and that zoo staff, especially keepers, have had proper training. Facilities should be fully acceptable to the Service and the Chinese Government prior to arrival of the animals.

6. Recommendations of the Secretariat of CITES

The Service agrees with the recommendation of the Secretariat that no exemptions be granted to the requirements of Article III for the shipment of giant pandas, even for animals that might otherwise qualify for an exemption as "pre-convention" under Article VII. Therefore, if the management authority of the country of origin or of the country of re-export does not issue a pre-Convention certification, the Service will require a U.S. import permit and an export permit or re-export certificate, as appropriate, from the exporting country in accordance with Article III of the Convention. The Service will also continue its policy of approving applications only if it is sure of the possibility that the loan did not, or will not, contribute to removal of pandas from the wild, and that noncommercial purposes for the loan predominate. No exhibition loan permit would typically be issued for animals removed from the wild after December 30, 1986.

Comments Solicited

The Service requests comments on this proposed policy. The final decision on this proposal will take into consideration the comments and any additional information received, and such consideration might lead to a final policy that differs from this proposal.

This notice was prepared by Dr. Charles W. Dane, Chief, Office of Scientific Authority, and Mr. Marshall P. Jones, Chief, Office of Management Authority, under the authority of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Dated: May 30, 1989.

Susan Recce Lawson,

Deputy Assistant Secretary for Fish and Wildlife and Parks.

50 CFR Part 23

RIN 1018-AA29

Proposed Changes in Appendices to the Endangered Species Convention

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of decision.

SUMMARY: The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) regulates international trade in certain animals and plants. Species for which trade is controlled are listed in Appendices I, II, and III to CITES. The United States as a Party to the Convention may propose amendments to the appendices for consideration by the other Parties.

In this notice, the Fish and Wildlife Service (Service) announces the decisions on proposals submitted by the United States to amend Appendices I and II. These proposals will be considered at the seventh regular meeting of the Conference of the Parties. The meeting is scheduled for October 9–20, 1989, in Lausanne, Switzerland.

DATES: Comments received by October 3, 1989, on proposals submitted will be considered in development of final negotiating positions. Comments must be received by this date in order for them to be adequately considered before the meeting of the Parties. Comments on those proposals submitted, as well as on the tentative negotiating positions on proposals by foreign countries and on non-species matters related to the agenda of the meeting of the Parties, may also be presented at a public meeting to be held on September 8, 1989, from 1:00–4:30 p.m., in room 7000 of the U.S. Department of the Interior, 18th and C Streets NW., Washington, DC.

ADDRESSES: Please send correspondence concerning this notice to the Office of Scientific Authority; Mail Stop: Room 725, Arlington Square; U.S. Fish and Wildlife Service; Department of the Interior, Washington, DC 20240.

Background materials will be available for public inspection from 8:00 a.m. to 4:00 p.m., Monday through Friday, in Room 750, 4401 Fairfax Drive, Arlington, Virginia.

FOR FURTHER INFORMATION CONTACT: Dr. Charles W. Dane, Chief, Office of Scientific Authority at the address given above, or telephone (703) 358–1708.

SUPPLEMENTARY INFORMATION:

Background

In its previous notices on this subject (53 FR 35530, September 14, 1988, and 54 FR 11551, March 21, 1989), the U.S. Fish and Wildlife Service (Service) first requested information on plant or animal species that might lead it to prepare listing amendments for the Convention, and then described tentative U.S. proposals and sought additional comments, requesting specific information for each of the tentative proposals. The proposals announced in this notice were submitted by the Service and received by the Convention's Secretariat on May 12, 1989, in order to be considered at the next biennial meeting of the parties in Lausanne, Switzerland.

Public Comments

Decisions about suggested U.S. proposals discussed in the previous notice of March 21, 1989, are as follows:

1. Red-eared slider (*Trachemys* [= *Pseudemys*] *scripta elegans*)—Comments were received by the Service during two time periods. The first was in response to the September 14, 1988, **Federal Register** notice requesting information on species that should be considered for listing changes. In response to that request, the International Wildlife Coalition submitted to the Service a proposal to include the red-eared slider in Appendix II of CITES. In response to the March 21, 1989 **Federal Register** notice, the Service received additional comments on this species. In order to use all of the information available, the Service considered all comments received on this species, including those provided by its biologists, in reaching its decision not to submit this proposal.

Written comments were received from two governmental agencies (Tennessee Department of Conservation, and the Chief, Epidemiology Section, Center for Infectious Disease, U.S. Public Health Service), from 11 conservation and animal welfare organizations (including Monitor, on behalf of 10 additional organizations), 24 professional herpetologists, 1 member of Congress, and about 200 private individuals. Many of those in support of the proposal cited concerns about the possible impact of escaped exports on foreign aquatic communities, disease transmission, and humane treatment. As important as these issues may be, the Service did not consider them to be applicable to the criteria for listing species in the Appendices to the Convention. Many respondents also cited concern about the collection of mature females from the wild to replace breeding stocks on turtle farms, and the use of adult red-eared sliders as a food source.

The criteria for listing in Appendix II as stated in resolution Conf. 1.1 require some indication that the species may be or may become threatened with extinction and that the species is presently subject to trade or is likely to become subject to trade. The information on the species status should indicate that the population is decreasing or is very limited in size or geographical distribution. Furthermore, the amount of trade should be such that there is evidence of actual or expected trade in such a volume as to constitute a potential threat to the survival of the species. The red-eared slider has an extensive distribution within the United States. With western limits of the Pecos River in New Mexico, the panhandle of Oklahoma, and western Kansas, it occurs throughout Texas and the southern states as far east as the Florida panhandle, Alabama, and central Tennessee and Kentucky. To the north, the species occurs throughout most of Missouri, Illinois, western Indiana, and into Wisconsin.

Little quantitative information is available on the size of population, but the species is reported to be common throughout much of its range although there are enough subjective (anecdotal) comments from herpetologists to suggest that it may have decreased in some areas (especially, Louisiana).

In 1987, the Service did not believe that the collecting of adult turtles to replace breeding stocks on turtle farms would threaten the survival of the species over its broad range (July 10, 1987, Federal Register). There does not appear to have been any substantial increase in the number of turtle farms, and the Service still believes that the species is not likely to become threatened with extinction as a result of the trade in turtles as pets.

However, the Service is concerned about the possibility that large numbers of adult female sliders are removed from the wild for export for Asian food markets and claims that wild populations have dramatically declined in numbers. Nevertheless, little data, other than anecdotal information, was furnished to demonstrate that there has been a significant impact on red-eared slider populations throughout its range, and the Service was unable to substantiate that large numbers of wild-caught adults are being exported to Asian countries for food.

The proposal from the International Wildlife Coalition indicated that 20,000–30,000 turtles per week are captured and exported for food during the peak of harvest season. This estimate appeared to be based on a report by Warwick and Steedman (1988) who estimated that 300,000 to 700,000 turtles are exported annually for food. TRAFFIC-U.S. with contacts to some U.S. seafood dealers, TRAFFIC-Japan, World Wildlife Fund-Hong Kong, and others tried to assess the occurrence of such a trade. They reported that no known market for these turtles as food items existed in Asia. Nevertheless, the Service will make a specific effort to collect information on exports, and will begin entering all information on red-eared sliders obtained at the ports into the computer data system including number and weight per shipment.

If additional information substantiates that there is a large uncontrolled market for these turtles as food items, the Service may consider proposing the listing of this species in Appendix II at a later date through the postal procedure (Article XV (2)).

2. African Elephant (*Loxodonta africana*)—In response to the September 14, 1988, **Federal Register** document requesting information on species that should be considered for listing changes, the Humane Society of the U.S. proposed that the African elephant be listed on Appendix I. In the March 21, 1989, **Federal Register** the Service indicated that it was considering the submission of such a proposal and asked for additional information.

The Service recognizes the significant decline in African elephant populations and the threat posed by continued poaching and illegal trade in elephant tusks and ivory pieces. In the February 3, 1989, **Federal Register** (54 FR 5553) information was sought as to the ability of ivory-producing countries to control poaching and properly manage their native elephant populations.

Written comments were received from conservation and animal welfare organizations and private individuals. One host country (Botswana) responded (in cable form) stating that "they had no intention of changing its position that elephants not be accorded total protection by being placed on Appendix I."

Four organizations (American Fur Industry; National Trappers Association, Inc.; Safari Club International; and the Wildlife Legislative Fund of America) urged the Service to reject any proposal to uplist the elephant until more information is available this summer (July) when the African Elephant Working Group convenes in Botswana. However, the deadline for submitting proposals was May 12, 1989. The other organizations

(The American Society for the Prevention of Cruelty to Animals; American Association of Zoological Parks and Aquariums; Committee for Humane Legislation; Bristol Humane Society, Inc.; International Wildlife Coalition; Friends of Animals; and the Humane Society of the United States) strongly support the uplisting of the African elephant to Appendix I. Most of the public comments (529 for; 23 against) supported listing the elephant in Appendix I.

The International Wildlife Coalition and the Friends of Animals both submitted draft amendments proposing the transfer of the African elephant from Appendix II to Appendix I. Information in these proposals was considered by the Service in the preparation of the proposal submitted to the CITES Secretariat, as well as information provided by TRAFFIC (USA) and the Humane Society of the United States.

In addition to the U.S. proposal to transfer the African elephant to Appendix I, six other nations (Austria, Gambia, Hungary, Kenya, Somalia, and Tanzania) recommended the proposed transfer.

3. Flying foxes (*Pteropus* spp. and *Acerodon* spp.)—The Service received a proposal to transfer all 14 taxa of flying foxes (also known as fruit bats) currently listed in Appendix II to Appendix I, and to add the remaining 48 species in the genus to Appendix II. In the March 21, 1989, **Federal Register** notice, the Service announced receiving this proposal and requested specific information on trade in and population status of any of these 48 species. At least one species listed in the genus *Acerodon* in the "Checklist of the Mammals of the World" is now considered belonging to the genus *Pteropus*. Conversely, in the proposal one of the species referred to as belonging to the genus *Pteropus* is, in fact, still generally considered to be in the genus *Acerodon*. Because of the perceived need to protect this species, *Acerodon jubatus*, and because the four other species listed in the genus *Acerodon* in the checklist appear especially similar to *Pteropus* species (differing only in dental characters), the Service also included them in the proposal submitted to the CITES Secretariat. However, the Service will be particularly receptive to any comments received on this proposal in developing its final negotiating position. In fact, some further field assessments are still being conducted by the Service.

Flying foxes have been an important source of food to traditional subsistence communities of the Pacific archipelagos of Micronesia and Polynesia and continue to be consumed in great quantities as a delicacy in more modern communities, especially on Guam. According to the proposal received, over 12,000 flying foxes from Palau, Truk, Pohnpei, Western Samoa, and the Philippines were imported into Guam in 1988, although over 50,000 have been requested for import. Palau, Truk, and Pohnpei are currently the largest suppliers.

Available data on the status of flying fox species of western Pacific archipelagos either indicate population declines due to commercial exploitation for food and/or document trade in species with especially restricted distributions.

The Service received 10 written comments during the public comment period: 8 from professional organizations, 1 from conservation and humane organizations, and 1 from the Government of Guam. Mr. Antonio S. Quitugua, Acting Director, of Guam's Aquatic and Wildlife Resources commented that their agency has collected information on the volume of flying fox imports into Guam for about 15 years and is the source of much of the data presented in the original proposal submitted to the Service. He states that current import levels from the Micronesian Islands of Palau, Truk, and Pohnpei continue to be high and raise legitimate concerns that overharvesting will decimate flying fox populations on these islands.

However, he stated that Guam could not support the uplisting of the 14 taxa of *Pteropus* from Appendix II to Appendix I since this would: (1) Increase the illegal hunting pressure on endangered flying foxes on Guam and the Northern Mariana Islands, and (2) expand the trade in flying foxes to other species. Mr. Quitugua stated that a more desirable option would be to add the remaining 48 species of *Pteropus* to Appendix II, to encourage all countries with populations of flying foxes "to establish management authorities for their natural resources, and to enforce the export permit requirement for the importation of these Appendix II species into Guam." Comments by others clarified distribution and status information, reporting a decrease in populations of flying foxes throughout their range in the Pacific.

Based upon all comments received, including those provided by Service biologists and pertinent information provided by Drs. Pierson and Rainey in their comprehensive proposal, the Service has submitted the following proposal for consideration at the next conference of the Parties in October: Transfer of *Pteropus insularis, P. mariannus, P. molossinus, P. phaeocephalus, P. pilosus, P. samoensis* (dead specimens and parts only) from Appendix II to Appendix I; retention of *P. marcrotis, P. tonganus,* and *P. tokudae* and the addition of *P. speciosus* and *Acerodon jubatus* in Appendix II under provisions of Article II, paragraph 2a; and inclusion of the remaining unlisted *Pteropus* species and all *Acerodon* species in Appendix II under provisions of Article II, paragraph 2b, i.e., for reasons of similarity of appearance (dead specimens and parts only).

4. Northern Pacific Fur Seal (*Callorhinus ursinus*)—The U.S. National Marine Fisheries Service requested that this species be proposed for inclusion in Appendix II of CITES. The fur seal was commercially harvested in the North Pacific under the auspices of a series of International Treaties from 1911 to 1984. The Interim Convention on Conservation of North Pacific Fur Seals of 1957 expired in 1984 and the resulting lack of regulations on international trade in this species and possible significant take, expecially of adult females, in the high seas driftnet fisheries constitute a continuing threat to its declining population.

The Service received 10 comments on this proposal: 7 from conservation and animal welfare organizations, one from the Alaska Department of Fish and Game, one from the Pribilof Aleut Fur Seal Commission, and one from the Marine Mammal Commission. Four organizations (American Association of Zoological Parks and Aquariums; Center for Marine Conservation; International Wildlife Coalition; and the Humane Society of the United States) favored the listing, while three organizations were opposed (American Fur Industry; National Trappers Association Inc.; and Safari Club International). The Pribilof Aleut Fur Seal Commission also opposed the proposed amendment. The Alaska Department of Fish and Game acknowledged that fur seals using the Pribilof Islands have declined greatly after the population peaked at approximately 2.2 million animals in the mid-1950's to about 870,000 animals at the present, but did not believe sufficient information was available to take a position on the proposed listing.

The Pribilof Aleut Fur Seal Commission opposed the Appendix II listing because the National Marine Fisheries Service previously found that the northern fur seal is not threatened, and because the Commission believed that inclusion of the species on Appendix II would seriously impede the development of a handicraft industry on the Pribilof Islands. The Service notes that the threatened status under the Endangered Species Act is not synonymous with an Appendix II listing. Furthermore, the Service does not consider that an Appendix II listing would in and of itself preclude the export of handicrafts made from seal parts should such exports be permitted by the National Marine Fisheries Service.

The Marine Mammal Commission, in consultation with its Committee of Scientific Advisors, has reviewed the proposal and recommended that the Service propose that the Northern Pacific Fur seal be added to Appendix II.

The Service submitted the proposal for consideration at the next biennial meeting of the Parties, but continues to seek additional relevant information.

5. Northern elephant seal (*Mirounga angustirostris*)—The U.S. National Marine Fisheries Service had recommended that this species be proposed for removal from Appendix II. The southern elephant seal (*M. leonina*) is also listed in Appendix II. There is no known international trade in either species. In 1985, the CITES Management Authority for Argentina suggested postponing the delisting of the northern elephant seal because of uncertainty about whether harvesting of the southern elephant seal might resume (exploitation ceased in 1961). Mexico, which harbors a major population of northern elephant seals, is not a Party to CITES, but has protected this species. Uncontrolled harvest in the United States is prohibited under the Marine Mammal Protection Act.

The Service received written comments from the American Association of Zoological Parks and Aquariums and the Center for Marine Conservation. Both recommended the removal of this species from Appendix II due to the lack of data of present exploitation. At the North American Regional CITES meeting on April 26, 1989, Fish and Wildlife Service representatives met with the Mexican government counterparts. The Mexican representative stated that they considered the species to be threatended and that there had been recent requests for specimens for exhibition purposes. Therefore, at the request of the Mexican government, the Service will not submit this proposal for consideration at the next biennial meeting of the Party Nations.

6. Resolution related to the first commercial captive breeding operation for an Appendix I animal species. In the September 14, 1988, **Federal Register** notice, the Service announced tentative criteria to be used to evaluate any proposal that might be submitted to request the Parties to accept the first commercial captive breeding operation for an Appendix I animal species, as called for in resolution Conf. 6.21. Although no one requested the United States to submit such a proposal, the Animals Committee requested the U.S. and Canadian Scientific Authorities to develop such criteria. Subsequently, a draft resolution relating to bred-in-captivity was discussed at the second meeting of the Animals Committee on April 4–6, 1989, in Montevideo, Uruguay.

In response to the draft resolution, Mr. David Alderton in the United Kingdom published an article in the April 22, 1989, Cage and Aviary Birds newsletter, which incorrectly stated that the resolution would apply to all bred-in-captivity determinations. The Service, in responce to Mr. Alderton's article, received 52 comments on the draft resolution, almost entirely from aviculturlists in the United Kingdom.

The United States and Canada did submit a revised resolution dealing with the first commercial captive breeding operation for an Appendix I animal species. This resolution will receive further review by the Animals Committee, and may serve as a basis for the Parties to consider any first commercial captive breeding operation for an Appendix I animal species. To date, one such proposal received by the CITES Secretariat has been withdrawn, and the Secretariat is endeavoring to clarify the intentions of a second Party. For commercial facilities involving species that have already been registered with the CITES Secretariat as "bred-in-captivity" as well as any new species accepted by the Parties, the Management Authority in the country of export is still responsible for interpreting resolution Conf. 2.12, and ensuring that other facilities registered with the Secretariat meet the criteria of Conf. 2.12 for the species for which that facility is being registered.

The resolution contains recommendations: (1) As to what removal of wild specimens should be considered detrimental, (2) criteria to minimize augmentation with wild specimens, including an initial minimum of 5 male and 5 female unrelated animals, plus a breeding scheme to minimize inbreeding, (3) an expectation for overall breeding success, including viable offspring (F_1) from 80 percent of the original 5 pairs, and documentation that 75 percent of the founders have some genetic representation in the second generation, and evidence that at least 50 percent of the breeding age specimens of the species at the operation must have produced viable offspring.

Copies of the draft resolution are available from the Office of Scientific Authority (see ADDRESSES). Comments on the proposed resolution will be considered in developing the final negotiating position on the resolution, and in further communications with the Animals Committee. In addition, the Service is preparing proposed guidelines for registering U.S. facilities producing Appendix I specimens as "bred-in-captivity" for commercial purposes. These guidelines will be for species already registered or accepted by the Parties, and will be the subject of a separate **Federal Register** notice.

7. Plants. Comments were received only on some proposals; these are summarized below. In addition, changes in some proposals have been made based on information that became available from other sources; such changes also are presented below. Particular information is still being sought on two proposals on trees, also indicated below. If there were no comments or other changes, the proposal was submitted as presented in the March 21, 1989, **Federal Register** (54 FR 11551). These include: (1) The proposal to transfer a new Colombian cycad genus, *Chiqua*, from Appendix II to Appendix I, (2) the proposal not to recommend annotating any Appendix I plant species (this will allow their hybrids to be regulated as Appendix II species), (3) the proposals under 10-year-review provisions to delist the following Appendix I species:

Prepusa hookeriana, Lavoisiera itambana, and *Guarea longipetiola,* and the following Appendix II species: *Phoenix hanceana* var. *philippinensis* and *Salacca clemensiana,* and (4) the 10-year-review proposal to downlist *Welwitschia mirabilis* to Appendix II. The other proposals included below are given in the same order as in the March 1989, **Federal Register** notice.

Madagascar succulents: The three species of *Pachypodium* identified in the March **Federal Register** and their natural hybrids were proposed in a separate document. Nine rather than 10 succulent species of *Euphorbia* were included in the proposal to uplist all dwarf species and their natural hybrids of the subgenus *Lacanthis* in Madagascar, since *E. decaryi* var. *cap-saintemariensis* was used instead of *E. cap-saintemariensis.*

Snowdrops: In the March 1989 **Federal Register**, it was stated that the four species of *Galanthus* would be proposed for Appendix I and others in Appendix II. However, the information that

became available better supported the final proposal, which included all species and natural hybrids of the genus in Appendix II.

Chamaedorea palms: Five commenters in commercial horticulture were opposed to all or parts of the proposal; some also supported parts of the proposal. One commenter gave tentative support to CITES regulation for 16 of the 18 species, and stated opposition for 2 species best known to him. Another commented in opposition, only on the same two species. A third commenter supported the listing in Appendix II of nine species, including the three species so recommended in the March 1989 **Federal Register**, and six other species that had been recommended for Appendix I. He opposed the listing of seven species that are successfully cultivated, although it was not clear from the comments to what extent wild seeds might be used in propagation of some of these, in addition to those (perhaps the majority) grown from seeds of plants in cultivation (the United States considers specimens grown from wild seeds not to quality as artificially propagated under CITES). A fourth commenter opposed listing any of the species, and provided information on most of them. The Florida Nurserymen and Growers Association requested that the proposal be set aside, or that a public hearing be held on it in Florida. After reviewing the revised proposal this association will have an opportunity to provide further comments either in writing or at the Service's September 8, 1989, meeting to receive comments on negotiating positions for the meeting of the Parties.

Some commenters did not seem familiar with the actual restrictions that would be imposed under CITES for specimens depending on whether the species was in Appendix I or Appendix II. Furthermore, some did not discern the regulatory distinctions of the different kinds or origins of specimens, for example wild seeds themselves, or specimens grown from wild seeds, or specimens artificially propagated, such as those grown from seeds of propagation stock plants indefinitely maintained under controlled conditions in cultivation. The Service's Office of Management Authority (P.O. Box 3507, Arlington, VA 22203, telephone 703/358–2104; fax 703/358–2232) can provide general information on the regulation of plants under CITES.

The final proposal submitted to the CITES Secretariat has also been sent to those commenting on the draft summary in the March 1989 **Federal Register**. It differs from that summarized in that document by: (1) Changing to propose four species (*Chamaedorea cataractarum, C. metallica, C. radicalis,* and *C. Seifrizii*) for Appendix II instead of Appendix I, and (2) by excluding artificially propagated specimens of *C. Seifrizii.* The Service is considering removal or modification of this exclusion and the only other similar exclusion, which was discussed for *C. elegans,* from the proposal. The Service remains interested in receiving any comments on the proposal to place 18 species and their natural hybrids of *Chamaedorea* under regulation by CITES, i.e., 9 species in Appendix I (*C. amabilis, C. ferruginea, C. glaucifolia, C. klotzschiana, C. montana, C. oreophila, C. pulchra, C. stolonifera,* and *C. tenella*), and 9 in Appendix II (including *C. elegans, C. ernesti-augusti, C. rojasiana, C. simplex,* and *C. tuerkheimii* in addition to the 4 species listed above that were changed to Appendix II), but excluding artificially propagated specimens of *C. elegans* and *C. seifrizii* (both proposed for Appendix II). Although *Chamaedorea* 'Florida Hybrid' (*C. erumpens* x *C. seifrizii*) normally would be regulated following CITES resolution Conf. 2.13, because *C. seifrizii* specimens that are artificially propagated are excluded, so also would be the hybrids made from such specimens. Only if wild specimens of *C. seifrizii* were used to make new hybrids would *C.* 'Florida Hybrid' be subject to regulation by CITES.

Madagascar palms: No proposal on these species was submitted for the seventh meeting of the Conference of the Parties this October; the anticipated draft proposal was not provided, and the partial information that was provided came too late and unexpectedly to develop into a proposal. Comments opposed to the uplisting of *Neodypsis decaryi* were received from three persons in commercial horticulture, who were concerned that regulating the seeds of this species would not benefit it in the wild; one stated that so much seed is available from commercial propagation stock, where it is now artificially propagated outside Madagascar, that it is unlikely there is a significant demand for the wild seeds now. One of the commenters requested delisting of the *Neodypsis,* a position the Service opposes because there is some evidence of continuing collection of its wild seeds for international trade. One of the commenters supported the listing of the other two palms, and one opposed the listing, stating as a general principle that unregulated exchange of seeds was mroe likely to prevent species' complete extinction, as they might survive in cultivation if not in their ecosystems.

Cycad seeds: One horticultural seed company commented to support the delisting of seeds of cycads in Appendix II of CITES, independently stating some of the views in the draft proposal. The Service submitted the proposal to delist these seeds to the CITES Secretariat.

10-year Review Actions: A taxonomic botanist specialized in aroids (Araceae) commented that *Alocasia zebrina* was common where he had seen it during field work. Based on all available information, the proposal to delist this Appendix I species was submitted. The Service also submitted a proposal to delist the Appendix I *Caryocar costaricense.* However the potential for international use of edible oils from this species may pose a sufficient risk to warrant retention of this species including its parts and derivatives on Appendix II. Use of these oils was not considered in making the proposal, nor has anyone commented or as yet provided information on this subject. Therefore, the Service would appreciate any information on this trade.

Switzerland has proposed to delist *Tachigali versicolor* from Appendix I, while the United States has proposed to downlist it to Appendix II. The United States may decide to support the Swiss proposal, but so far has been unable to obtain valuable information from several U.S. researchers who may be studying the species in the field. It expects to be able to obtain the information in September, which may add support for the Swiss proposal.

List of Subjects in 50 CFR Part 23

Endangered and threatened plants, Endangered and threatened wildlife, Exports, Fish, Imports, Marine mammals, Plants (agriculture) Treaties.

This notice is issued under authority of the Endangered Species Act of 1973 (16 U.S.C. 1531 et seq.; 87 Stat. 884, as amended). It was prepared by Drs. Richard M. Mitchell and Bruce MacBryde, Office of Scientific Authority.

Dated: August 29, 1989.

Richard N. Smith,

Acting Deputy Director.

RIN 0648–AB25

Atlantic Coast Striped Bass Regulations in the Exclusive Economic Zone

AGENCY: National Marine Fisheries Service, NOAA, Commerce.

ACTION: Notice of extension of comment period.

SUMMARY: NOAA issues this notice to extend the period during which the public may comment on the advance notice of proposed rulemaking (ANPR) on regulations on fishing for Atlantic striped bass in the exclusive economic zone (EEZ) 3–200 miles (4.8–321.9 km) offshore. Copies of the advance notice of proposed rulemaking may be obtained from the address below.

DATE: Comments on the ANPR should be submitted on or before October 15, 1989.

ADDRESSES: Send comments on the ANPR to Richard H. Schaefer, Director, Office of Fisheries Conservation and Management, National Marine Fisheries Service, 1335 East-West Highway, Silver Spring, MD 20910.

FOR FURTHER INFORMATION CONTACT: David G. Deuel or Austin R. Magill, 301–427–2347.

SUPPLEMENTARY INFORMATION:

Background

The ANPR on proposed regulations on fishing for Atlantic striped bass in the EEZ was published in the **Federal Register** on August 16, 1989 (54 FR 33735). The schedule for this submitted ANPR specified a comment period through September 15, 1989.

A key organization to supply comments from on the ANPR is the Atlantic States Marine Fisheries Commission. The management measures presented in the ANPR were discussed at the Atlantic States Marine Fisheries Commission's Striped Bass Management Board Meeting on August 23, 1989. The Board (representatives of five coastal states) concluded that it would prefer to discuss proposed regulations with all 12 member Atlantic coastal states involved with striped bass management. The annual meeting of the Atlantic States Marine Fisheries Commission is scheduled for October 2–5, 1989, and the management measures in the ANPR could be discussed by all member states at that time. Therefore, to obtain the views of all member states of the Commission, the comment period is extended through October 15, 1989 by this notice.

(16 U.S.C. 1851 note)

Dated: August 29, 1989.

Richard H. Schaefer,

Director of Office of Fisheries, Conservation and Management, National Marine Fisheries Service.

BILLING CODE 3510–22–M

Notices

Federal Register

Vol. 54, No. 170

Tuesday, September 5, 1989

This section of the FEDERAL REGISTER contains documents other than rules or proposed rules that are applicable to the public. Notices of hearings and investigations, committee meetings, agency decisions and rulings, delegations of authority, filing of petitions and applications and agency statements of organization and functions are examples of documents appearing in this section.

DEPARTMENT OF AGRICULTURE

Office of the Secretary

Privacy Act; System of Records

AGENCY: Office of the Secretary, USDA.

ACTION: Notice of revision of Privacy Act Systems of Records.

SUMMARY: Notice is hereby given that the United States Department of Agriculture (USDA) is revising one of its Privacy Act Systems of Records, USDA/FmHA–1, "Applicant/Borrower or Grantee File, USDA/FmHA," for the purpose of adding two new routine uses and to clarify one of the previously established routine uses of the system.

EFFECTIVE DATE: This notice will be adopted without further publication in the **Federal Register** on November 6, 1989, unless modied by a subsequent notice to incorporate comments received from the public. Comments must be received by the contact person listed below on or before October 5, 1989.

FOR FURTHER INFORMATION CONTACT: Aimee Fisher, Freedom of Information Officer, Administrative Services Division, Farmers Home Administration (FmHA) USDA, Room 6865, South Building, Washington, DC 20250; telephone (202) 382–9638.

SUPPLEMENTARY INFORMATION: USDA/FmHA hereby revises its System of Records, USDA/FmHA–1, by amending the "routine uses of records maintained in the system, including categories of users and the purposes of such uses".

One new routine use is being added to implement the discretion granted the Secretary of Agriculture under the Stewart B. McKinney Homeless Assistance Amendments of 1988 (Pub. L. No. 100–628, dated November 7, 1988, which amended section 510(d) of the Housing Act of 1949) to permit litigation arising under section 502 (Farmers Home Administration single family housing loans) to be handled by the Department of Justice, by the USDA Office of the General Counsel, or by contract with private sector attorneys. This new routine use permits private sector attorneys under contract to provide legal services access to the FmHA files of borrowers involved in foreclosure, possession, and collection actions related to their FmHA loans. A second new routine use is being added to enable FmHA to refer its files to the Department of Justice for the purpose of litigation arising under statutes administered by FmHA. This system notice also modifies a previously published routine use to clarify that FmHA must make a determination, prior to releasing information that constitutes evidence in a judicial or administrative proceeding or that is sought in the course of discovery, that the information disclosed is relevant and necessary to the proceeding. A minor stylistic change has also been made to a second previously published routine use for purposes of clarity.

Accordingly, USDA publishes the following routine uses of the FmHA System of Records, "Applicant/Borrower or Grantee File, USDA/FmHA–1," originally published in 50 FR 25727, June 21, 1985:

USDA/FmHA–1

System Name:

Applicant/Borrower or Grantee File, USDA/FmHA–1

* * * * *

Routine Uses of Records Maintained in the System, Including Categories of Users and the Purposes of Such Uses:

Referral to the appropriate agency, whether Federal, State, local or foreign, charged with the responsibility of investigating or prosecuting a violation of law, or of enforcing or implementing a statute or a rule, regulation or order issued pursuant thereto, of any record within this system when information available indicates a violation or potential violation of law, whether civil, criminal or regulatory in nature, and whether arising by general statute or particular program statute, or by rule, regulation or order issued pursuant thereto.

Information not identified with any individual borrower(s) may provide the basis for statistical reports and news releases citing borrowers' progress.

Referral to employers, businesses, landlords, creditors and others to determine repayment ability and eligibility for FmHA programs. Disclosure may be made to a Congressional office from the record of an individual in response to an inquiry from the Congressional office made at the request of that individual.

Referral to a collection or servicing contractor, or a local, State, or Federal agency, when FmHA determines such referral is appropriate for servicing or collecting the borrower's account or as provided for in contracts with servicing or collection agencies.

Referral to a court, magistrate, or administrative tribunal, or to opposing counsel in a proceeding before any of the above, of any record within the system which constitutes evidence in that proceeding, or which is sought in the course of discovery, to the extent that the information disclosed is relevant and necessary to the proceeding.

Referral of commercial credit information, which is filed in a system of records, to a commercial credit reporting agency for it to make the information publicly available.

Referral to financial consultants, advisors, or underwriters, when FmHA determines such referral is appropriate for developing packaging and marketing strategies involving the sale of FmHA loan assets required by the Omnibus Budget Reconciliation Act of 1986, Pub. L. 99–509.

Referral to private attorneys under contract either with FmHA or with the Department of Justice for the purpose of foreclosure and possession actions and collection of past due accounts in connection with FmHA loans.

Referral to the Department of Justice for the purpose of litigation arising under statutes administered by FmHA.

Dated: August 29, 1989.

Clayton Yeutter,

Secretary of Agriculture.

BILLING CODE 3410–01–M

Animal and Plant Health Inspection Service

[Docket No. 89–133]

Availability of Environmental Assessment and Finding of No Significant Impact Relative to Issuance of a Permit to Field Test Genetically Engineered Tomato Plants

AGENCY: Animal and Plant Health Inspection Service, USDA.

ACTION: Notice.

SUMMARY: We are advising the public that an environmental assessment and finding of no significant impact have been prepared by the Animal and Plant Health Inspection Service relative to the issuance of a permit to Monsanto Agricultural Company to allow the field testing, in Jerseyville, Illinois, of genetically engineered tomato plants. The tomato plants have been genetically engineered to be tolerant to tobacco mosaic virus, tomato mosaic virus, or both. The assessment provides a basis for the conclusion that the field testing of these genetically engineered tomato plants will not present a risk of introduction or dissemination of a plant pest and will not have any significant impact on the quality of the human environment. Based upon this finding of no significant impact, the Animal and Plant Health Inspection Service has determined that an environmental impact statement need not be prepared.

ADDRESS: Copies of the environmental assessment and finding of no significant impact are available for public inspection at Biotechnology, Biologics, and Environmental Protection, Animal and Plant Health Inspection Service, U.S. Department of Agriculture, Room 850, Federal Building, 6505 Belcrest Road, Hyattsville, MD, between 8 a.m. and 4:30 p.m., Monday through Friday, except holidays.

FOR FURTHER INFORMATION CONTACT: Dr. Michael Schechtman, Biotechnologist, Biotechnology Permit Unit, Biotechnology, Biologics, and Environmental Protection, Animal and Plant Health Inspection Service, U.S. Department of Agriculture, Room 850, Federal Building, 6505 Belcrest Road, Hyattsville, MD 20782, (301) 436–8761. For copies of the environmental assessment and finding of no significant impact, write Ms. Linda Gordon at this same address. The environmental assessment should be requested under accession number 89–073–01.

SUPPLEMENTARY INFORMATION:

The regulations in 7 CFR part 340 regulate the introduction (importation, interstate movement, and release into the environment) of genetically engineered organisms and products that are plant pests or that there is reason to believe are plant pests (regulated articles). A permit must be obtained before a regulated article can be introduced in the United States. The regulations set forth procedures for obtaining a limited permit for the importation or interstate movement of a regulated article and for obtaining a permit for the release into the environment of a regulated article. The Animal and Plant Health Inspection Service (APHIS) has stated that it would prepare an environmental assessment and, when necessary, an environmental impact statement before issuing a permit for the release into the environment of a regulated article (see 52 FR 22906).

Monsanto Agricultural Company of St. Louis, Missouri, has submitted an application for a permit for release into the environment, to field test tomato plants genetically engineered to be tolerant to tobacco mosaic virus, tomato mosaic virus, or both. The field trial will take place in Jerseyville, Illinois.

In the course of reviewing the permit application, APHIS assessed the impact on the environment of releasing the tomato plants under conditions described in the Monsanto Agricultural Company application. APHIS concluded that the field testing will not present a risk of plant pest introduction or dissemination and will not have any significant impact on the quality of the human environment.

The environmental assessment and finding of no significant impact, which are based on data submitted by Monsanto Agricultural Company, as well as a review of other relevant literature, provide the public with documentation of APHIS' review and analysis of the environmental impacts associated with conducting the field testing.

The facts supporting APHIS's finding of no significant impact are summarized below and are contained in the environmental assessment.

1. Genes encoding the tobacco mosaic virus coat (capsid) protein and the tomato mosaic virus coat protein have been inserted separately and jointly into the chromosomes of a series of tomato plants. In nature, the genetic material contained in a plant chromosome can only be transferred to other sexually compatible plants via cross-pollination. In this field trial, the inserted gene(s) would not spread to any other plant by cross-pollination because the field test plot is a sufficient distance from any sexually compatible plants with which the genetically engineered tomato plants might cross-pollinate.

2. Neither the viral coat (capsid) protein genes, nor their gene products, confers on tomato plants any plant pathogenic characteristic. Introduction of these genes is expected to have no effect on complex plant characteristics such as the ability to fix nitrogen, yield, or susceptibility to unrelated plant pests.

3. The plasmid vectors used to transfer the tobacco mosaic virus coat (capsid) protein gene and the tomato mosaic virus coat protein gene into a tomato chromosome have been evaluated for their use in this experiment, and do not pose a plant pesk risk. The plasmid vectors, although derived from an original Ti plasmid with known plant pathogenic potential, have been disarmed; that is, genes that are necessary to confer phytopathogenicity have been removed from them. The plasmid vectors have been tested either alone or with their host bacterium, and shown to be nonpathogenic to susceptible plants.

4. The vector agent, the phytopathogenic bacterium that was used to deliver the plasmid vector encoding the tobacco mosaic virus coat (capsid) protein gene and the tomato mosaic virus coat protein gene into a tomato plant cell, has been shown to be eliminated and no longer associated with any transformed tomato plant or seed.

5. Horizontal movement by infectious transfer of the introduced gene is not known to be possible. The plasmid vector acts by delivering the gene to the tomato genome where it is stably inserted into the tomato chromosomal DNA. The plasmid vector cannot replicate independently of its vector agent and does not survive in any plant. No mechanism of horizontal movement is known to exist in nature to move the inserted gene from a chromosome of a transformed plant to any other organism.

6. The field test plot, which is approximately 0.8 acre, will be located on a large research farm. The research farm is located in an isolated area and has been safely used for controlled experiments employing regulated articles. The level of physical containment has been found to be adequate to prevent an accidental release or dissemination into the environment.

7. The field experiment will be ended by mowing and disking tomato plants and fruit back into the field plot. To eliminate volunteer plants, the plot will be cultivated as necessary for 2 months following the test, and again the following spring.

The environmental assessment and finding of no significant impact have been prepared in accordance with: (1) The National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4331 *et seq.*), (2) Regulations of the Council on Environmental Quality for Implementing the Procedural Provisions of NEPA (40 CFR parts 1500–1509), (3) USDA Regulations Implementing NEPA (7 CFR part 1b), and (4) APHIS Guidelines Implementing NEPA (44 FR 50381–50384, August 28, 1979, and 44 FR 51272–51274, August 31, 1979).

Done in Washington, DC, this 30th day of August 1989.

James W. Glosser,

Administrator, Animal and Plant Health Inspection Service.

[FR Doc. 89–20738 Filed 9–1–89; 8:45 am]

BILLING CODE 3410–34–M

[Docket No. 89–143]

U.S. Veterinary Biological Product and Establishment Licenses Issued, Suspended, Revoked, or Terminated

AGENCY: Animal and Plant Health Inspection Service, USDA.

ACTION: Notice.

SUMMARY: The purpose of this notice is to advise the public of the issuance, suspension, revocation, or termination of veterinary biological product and establishment licenses, and veterinary biological product permits by the Animal and Plant Health Inspection Service during the month of June 1989. These actions are taken in accordance with the regulations issued pursuant to the Virus-Serum-Toxin Act.

FOR FURTHER INFORMATION CONTACT: Joan Montgomery, Program Assistance, Veterinary Biologics, Biotechnology, Biologics, and Environmental Protection, Animal and Plant Health Inspection Service, U.S. Department of Agriculture, Room 838, Federal Building, 6505 Belcrest Road, Hyattsville, MD 20782, (301) 436–6332.

SUPPLEMENTARY INFORMATION: The regulations in 9 CFR part 102, "Licenses For Biological Products," require that every person who prepares certain biological products that are subject to the Virus-Serum-Toxin Act (21 U.S.C. 151 *et seq.*) shall hold an unexpired, unsuspended, and unrevoked U.S. Veterinary Biological Product License. The regulations set forth the procedures for applying for a license, the criteria for determining whether a license shall be issued, and the form of the license.

Pursuant to these regulations, the Animal and Plant Health Inspection Service (APHIS) issued the following U.S. Veterinary Biological Product Licenses during the month of June 1989:

Product license code	Date issued	Product	Establishment	Establishment license No.
1095.20	06-30-89	Bovine respiratory syncytial virus vaccine, killed virus	Grand Laboratories, Inc.	303.
1177.20	06-07-89	Bovine rhinotracheitis-virus diarrhea-parainfluenza₃ vaccine, modified live and killed virus.	CEVA Laboratories, Inc.	243–A.
1185.20	06-23-89	Bovine rhinotracheitis-virus diarrhea-parainfluenza₃-respiratory syncytial virus vaccine, killed virus.	Grand Laboratories, Inc.	303.
1679.31	06-07-89	Mink distemper-enteritis vaccine, modified live and killed virus	Harlan Sprague Dawley, Inc.	245.
1685.21	06-07-89	Mink enteritis, vaccine, killed virus	Harlan Sprague Dawley, Inc.	245.
1895.00	06-02-89	Pseudorabies vaccine, killed virus	Boehringer Ingelheim Animal Health, Inc.	124.
2840.00	06-09-89	Streptococcus suis bacterin	Bio VAc Laboratories, Inc.	307.
48B5.10	06-16-89	Newcastle-bronchitis vaccine—mycoplasma gallisepticum bacterin, killed virus.	Schering Corporation	165–A.
4929.31	06-07-89	Mink distemper-enteritis vaccine—clostridium botulinum type C bacterin-toxoid, modified live and killed virus.	Harlan Sprague Dawley, Inc.	245.
4949.31	06-07-89	Mink distemper-enteritis vaccine—clostridium botulinum type C-pseudomonas aeruginosa bacterin-toxoid, modified live and killed virus.	Harlan Sprague Dawley, Inc.	245.
4955.21	06-07-89	Mink enteritis vaccine—clostridium botulinum type C bacterin-toxoid, killed virus.	Harlan Sprague Dawley, Inc.	245.
49A5.21	06-07-89	Mink enteritis vaccine—clostridium botulinum type C-pseudomonas aeruginosa bacterin-toxoid, killed virus.	Harlan Sprague Dawley, Inc.	245.
B699.00	06-15-89	Pasteurella haemolytica toxoid	Langford Laboratories, Inc.	362.
A271.01	06-23-89	Bursal disease virus, live virus, for further manufacture	Select Laboratories, Inc.	279.
B641.00	06-23-89	Erysipelothrix rhusiopathiae bacterin, for further manufacture	SmithKline Beckman Corporation	189.

The regulations in 9 CFR part 104, "Permits for Biological Products," require that every person importing biological products subject to the Virus-Serum-Toxin Act (21 U.S.C. 151 *et seq.*) into the United States shall hold a U.S. Veterinary Biological Product Permit for each biological product to be imported. The regulations set forth the procedures for applying for a permit, the criteria for determining whether a permit shall be issued, and the form of the permit. Pursuant to these regulations, APHIS issued the following U.S. Veterinary Biological Product Permit for general distribution and sale during the month of June 1989:

Establishment	Permit No.	Dated Issued
Langford Laboratories, Inc.	362	June 15, 1989.

The regulations in 9 CFR part 102 also require that each person who prepares biological products that are subject to the Virus-Serum-Toxin Act (21 U.S.C. 151 *et seq.*) shall hold a U.S. Veterinary Biologics Establishment License. The regulations set forth the procedures for applying for a license, the criteria for determining whether a license shall be issued, and the form of the license. No U.S. Veterinary Biological Establishment Licenses were issued during the month of June 1989.

The regulations in 9 CFR parts 102 and 105 also contain provisions concerning the suspension, revocation, and termination of U.S. Veterinary Biological Product Licenses, U.S. Veterinary Biologics Establishment Licenses, and U.S. Veterinary Biological Product Permits. No U.S. Veterinary Biological Product Licenses, U.S. Veterinary Biologics Establishment Licenses, or U.S. Veterinary Biological Product Permits were suspended, revoked, or terminated during the month of June 1989.

Done in Washington, DC, this 30th day of August 1989.

James W. Glosser,

Administrator, Animal and Plant Health Inspection Service.

BILLING CODE 3410-34-M

DEPARTMENT OF COMMERCE

Agency Information Collection Under Review by the Office of Management and Budget

DOC has submitted to the Office of Management and Budget (OMB) for clearance the following proposal for collection of information under the provisions of the Paperwork Reduction Act (44 U.S.C. Chapter 35).

Agency: National Oceanic and Atmospheric Administration.
Title: Weather Modification Activities Report.
Form Numbers: NOAA—Forms 17-4, 17-4A, and 17-4B; OMB—0648-0025.
Type of Request: Request for extension of OMB approval of a currently cleared collection.
Burden: 40 respondents; 40 reporting hours; average hours per response—.5 hours; recordkeeping hours—5 hours per recordkeeper.
Needs and Uses: All non-Federal attempts to modify the weather must be reported. The data on the attempts are used to show trends in modification activities and for research.
Affected Public: State or local governments, businesses or other for-profit, small businesses or organizations.
Frequency: On occasion, recordkeeping.
Respondent's Obligation: Mandatory.
OMB Desk Officer: Russell Scarato, 395-7340.

Copies of the above information collection proposal can be obtained by calling or writing DOC Clearance Officer, Edward Michals, (202) 377-3271, Department of Commerce, Room 6622, 14th and Constitution Avenue NW., Washington, DC 20230.

Written comments and recommendations for the proposed information collection should be sent to Russell Scarato, OMB Desk Officer, Room 3208, New Executive Office Building, Washington, D.C. 20503.

Dated: August 28, 1989.

Edward Michals,

Departmental Clearance Officer, Office of Management and Organization.

[FR Doc. 89-20667 Filed 9-1-89; 8:45 am]

BILLING CODE 3510-CW-M

Agency Form Under Review by the Office of Management and Budget

DOC has submitted to the Office of Management and Budget (OMB) for clearance the following proposal for collection of information under the provisions of the Paperwork Reduction Act (44 U.S.C. Chapter 35).

Agency: Bureau of the Census.

Title: Quarterly Financial Report.

Form Number: QFR-101, 101A, 102, 103A.

Agency Approval Number: 0607-0432.

Type of Request: Revision of a currently approved collection.

Burden: 180,980 hours.

Number of Respondents: 14,785.

Avg Hours per Response: 4 hours and 11 minutes.

Needs and Uses: The Quarterly Financial Report (QFR) is the best source of timely financial data for gauging quarterly performance of the nonregulated, domestic corporate sector. Data are collected from a sample of manufacturing, mining, and trade corporations and are used by Government and private sector organizations and individuals for economic policy making and in estimating the Gross National Product.

Affected Public: Businesses and other for profit organizations and small businesses or organizations.

Frequency: Quarterly, Annually QFR-103A only, Biennially QFR-103A only.

Respondent's Obligation: Mandatory.

OMB Desk Officer: Don Arbuckle, 395-7340.

Copies of the above information collection proposal can be obtained by calling or writing DOC Clearance Officer, Edward Michals, (202) 377-3271, Department of Commerce, Room H6622, 14th and Constitution Avenue, NW., Washington, DC 20230.

Written comments and recommendations for the proposed information collection should be sent to Don Arbuckle, OMB Desk Officer, Room 3208, New Executive Office Building, Washington, DC 20503.

Dated: August 25, 1989.

Edward Michals,

Departmental Clearance Officer, Office of Management and Organization.

Bureau of Export Administration

Joint Factory Computing and Communications Subcommittee of: The Automated Manufacturing Equipment Technical Advisory Committee; the Computer Peripherals, Components and Related Test Equipment Technical Advisory Committee; the Computer Systems Technical Advisory Committee and the Electronic Instrumentation Technical Advisory Committee; Partially Closed Meeting

A meeting of the Joint Factory Computing and Communications Subcommittee of the Automated Manufacturing Equipment Technical Advisory Committee; the Computer Peripherals, Components and Related Test Equipment Technical Advisory Committee; the Computer Systems Technical Advisory Committee and the Electronic Instrumentation Technical Advisory Committee will be held September 29, 1989, 9:00 a.m., Room 1617F, Herbert C. Hoover Building, 14th Street and Constitution Avenue NW., Washington, DC. The Joint Subcommittee advises the Office of Technology & Policy Analysis on overlapping issues such as: Computerized Numerical Control (CNC), Computer-Aided-Design (CAD), Computer-Aided-Manufacturing (CAM), Computer Aided-Engineering (CAE), etc.

Agenda

General Session

1. Opening remarks by the Chairman.
2. Presentation of papers or comments by the public.
3. Reports from Technical Advisory Committee Representatives.
4. Discussion of CAD Project.
5. Networking.
6. Discussion of Automated Test Equipment.
7. Other Business.

Executive Session

8. Discussion of matters properly classified under Executive Order 12356, dealing with the U.S. and COCOM control program and strategic criteria related thereto.

The General Session of the meeting will be open to the public and a limited number of seats will be available. To the extent that time permits, members of the public may present oral statements to the Committee. Written statements may be submitted at any time before or after the meeting. However, to facilitate distribution of public presentation materials to the Committee members, the Committee suggests that the

materials be forwarded two weeks prior to the meeting date to the following address: Lee Ann Carpenter, Technical Support Staff, OTPA/BXA, Room 4069A, U.S. Department of Commerce, 14th & Constitution Ave., NW., Washington, DC 20230.

The Assistant Secretary for Administration, with the concurrence of the General Counsel, formally determined on January 10, 1988, pursuant to section 10(d) of the Federal Advisory Committee Act, as amended, that the series of meetings of the Committee and of any Subcommittee thereof, dealing with the classified materials listed in 5 U.S.C., 552b(c)(1) shall be exempt from the provisions relating to public meetings found in sections 10 (a)(1) and (a)(3), of the Federal Advisory Committee Act. The remaining series of meetings or portions thereof will be open to the public.

A copy of the Notice of Determination to close meetings or portions of meetings of the Subcommittee is available for public inspection and copying in the Central Reference and Records Inspection Facility, Room 6628, U.S. Department of Commerce, Washington, DC 20230. For further information or copies of the minutes, contact Lee Ann Carpenter on 202/377-2583.

Dated: August 29, 1989.

William L. Clements,

Acting Director, Office of Technology & Policy Analysis.

[FR Doc. 89-20724 Filed 9-1-89; 8:45 am]

BILLING CODE 3510-DT-M

Computer Systems Technical Advisory Committee; Partially Closed Meeting

A meeting of the Computer Systems Technical Advisory Committee will be held September 27, 1989, 1:00 p.m. in the Herbert C. Hoover Building, Room 1617F, 14th & Constitution Avenue, NW., Washington, DC. The Committee advises the Office of Technology and Policy Analysis with respect to technical questions which affect the level of export controls applicable to computer systems or technology.

Agenda

General Session

1. Opening remarks by the Chairman.

2. Presentation of papers or comments by the public.

3. Supercomputer Subcommittee Annual Report and 1990 Plan.

4. Computer Systems Technical Advisory Committee Annual Report and 1990 Plan.

5. Meeting Dates and Agenda for Future Meeting in Portland, Oregon.

6. Miscellaneous Items (Other Meeting Reports and Status Items).

Executive Session

7. Discussion of matters properly classified under Executive Order 12356, dealing with the U.S. and COCOM control program and strategic criteria related thereto.

The General Session of the meeting will be open to the public and a limited number of seats will be available. To the extent that time permits, members of the public may present oral statements to the Committee. Written statements may be submitted at any time before or after the meeting. However, to facilitate distribution of public presentation materials to the Committee members, the Committee suggests that the materials be forwarded two weeks prior to the meeting date to the following address: Lee Ann Carpenter, Technical Support Staff, OTPA/BXA, Room 4069A, U.S. Department of Commerce, 14th and Pennsylvania Avenue NW., Washington, DC 20230.

The Assistant Secretary for Administration, with the concurrence of the delegate of the General Counsel, formally determined on January 10, 1988, pursuant to section 10 (d) of the Federal Advisory Committee Act, as amended, that the series of meetings or portions of meetings of the Committee and of any Subcommittees thereof, dealing with the classified material listed in 5 U.S.C. 552b(c)(1) shall be exempt from the provisions relating to public meetings found in section 10(a)(1) and (a)(3) of the Federal Advisory Committee Act. The remaining series of meetings or portions thereof will be open to the public.

A copy of the Notice of Determination to close meetings or portions thereof is available for public inspection and copying in the Central Reference and Records Inspection Facility, Room 6628, U.S. Department of Commerce, Washington, DC 20230. For further information, contact Lee Ann Carpenter at (202) 377-2583.

Dated: August 29, 1989.

BILLING CODE 3510-DT-M

Hardware Subcommittee of the Computer Systems Technical Advisory Committee; Partially Closed Meeting

A meeting of the Hardware Subcommittee of the Computer Systems Technical Advisory Committee will be held September 28, 1989, 1:00 p.m., Room 1617F, Herbert C. Hoover Building, 14th Street and Constitution Avenue, NW., Washington, DC. The Hardware Subcommittee was formed to study computer hardware with the goal of making recommendations to the Department of Commerce relating to the appropriate parameters for controlling exports for reasons of national security.

Agenda

General Session

1. Opening Remarks by the Chairman.

2. Presentation of Papers or Comments by the Public.

3. Annual Report and 1990 Plan.

4. Status on Array Processor Foreign Availability Study.

5. Computer Systems Technical Advisory Committee Responses to Department of Commerce.

6. LAN Proposal Review.

7. License Simplification Proposal.

8. Workstations.

Executive Session

9. Discussion of matters properly classified under Executive Order 12356, dealing with the U.S. and COCOM control program and strategic criteria related thereto.

The general session of the meeting will be open to the public and a limited number of seats will be available. To the extent that time permits, members of the public may present oral statements to the Committee. Written statements may be submitted at any time before or after the meeting. However, to facilitate distribution of public presentation materials to the Committee members, the Committee suggests that the materials be forwarded two weeks prior to the meeting date to the following address: Lee Ann Carpenter, Technical Support Staff, OTPA/BXA, Room 4069A, U.S. Department of Commerce, 14th and Pennsylvania Avenue NW., Washington, DC 20230.

The Assistant Secretary for Administration, with the concurrence of the delegate of the General Counsel, formally determined on January 10, 1988, pursuant to section 10(d) of the Federal Advisory Committee Act, as amended, that the series of meetings or portions of meetings of the Committee and of any Subcommittee thereof, dealing with the classified materials listed in 5 U.S.C. 552b(c)(1) shall be exempt from the provisions relating to public meetings found in section 10(a)(1) and (a)(3), of the Federal Advisory Committee Act. The remaining series of meetings or portions thereof will be open to the public.

A copy of the Notice of Determination to close meetings or portions of meetings of the Committee is available for public inspection and copying in the Central Reference and Records Inspection Facility, Room 6628, U.S. Department of Commerce, Washington, DC. For further information or copies of the minutes, call Lee Ann Carpenter at (202) 377–2583.

Dated: August 29, 1989.

William L. Clements,

Acting Director, Office of Technology & Policy Analysis.

BILLING CODE 3510-DT-M

International Trade Administration

[C–223–601]

Certain Cut Flowers From Costa Rica; Final Results of Countervailing Duty Administrative Review

AGENCY: International Trade Administration/Import Administration, Commerce.

ACTION: Notice of final results of countervailing duty administrative review.

SUMMARY: On June 28, 1989, the Department of Commerce published the preliminary results of its administrative review of the agreement suspending the countervailing duty investigation on certain cut flowers from Costa Rica. We have now completed that review and determine that the signatories have complied with the terms of the suspension agreement during the period January 13, 1987 through December 31, 1987.

EFFECTIVE DATE: September 5, 1989.

FOR FURTHER INFORMATION CONTACT: Philip Pia or Paul McGarr, Office of Countervailing Compliance, International Trade Administration, U.S. Department of Commerce, Washington, DC 20230; telephone: (202) 377–2786.

SUPPLEMENTARY INFORMATION:

Background

On June 28, 1989, the Department of Commerce ("the Department") published in the **Federal Register** (54 FR 27197) the preliminary results of its administrative review of the agreement suspending the countervailing duty investigation regarding certain cut flowers from Costa Rica (52 FR 1356; January 13, 1987). We have now completed that administrative review in

accordance with section 751 of the Tariff Act of 1930 ("the Tariff Act").

Scope of Review

Imports covered by this review are shipments of Costa Rican miniature (spray) carnations, standard carnations and pompon chrysanthemums. During the review period, such merchandise was classifiable under items 192.17 and 192.21 of the Tariff Schedules of the United States. This merchandise is currently classifiable under HTS items 0603.10.30 and 0603.10.70.

The review covers 29 producers and exporters of the subject merchandise. These 29 producers and exporters, along with the Government of Costa Rica (GOCR) and the Asociacion Costarricense de Floricultores (ACOFLOR), are the signatories to the suspension agreement (see Appendix A of this notice for a listing of the 29 signatory producers and exporters).

The review covers the period January 13, 1987 through December 31, 1987, and six programs: (1) Tax Credit Certificates; (2) Certificates for Increasing Exports (CIEX); (3) Income Tax Exemptions for Export Earnings; (4) Exporter Credit for Sales Tax and Consumption Tax on Certain Domestic Purchases; (5) Exporter Exemptions for Taxes and Duties on Imports; and (6) Accelerated Depreciation.

Final Results of Review

We gave interested parties an opportunity to comment on the preliminary results. We received no comments.

As a result of our review, we determine that the signatories have complied with the terms of the suspension agreement for the period January 13, 1987 through December 31, 1987.

The agreement can remain in force only as long as shipments from the signatories account for at least 85 percent of imports of the subject cut flowers into the United States. Our information indicates that the 29 signatory companies accounted for substantially all of the imports into the United States of this merchandise during the review period.

This administrative review and notice are in accordance with section 751(a)(1) of the Tariff Act (19 U.S.C. 1675(a)(1)) and § 355.22 of the Commerce Regulations published in the **Federal Register** on December 27, 1988 (53 FR 52306) (to be codified at 19 CFR 355.22).

Dated: August 23, 1989.

Eric I. Garfinkel,

Assistant Secretary for Import Administration.

Appendix A

List of Signatory Producers and Exporters

1. American Flower Corp., S.A.

BILLING CODE 3510-DS-M

[C–533–065]

Certain Fasteners From India; Revocation of Countervailing Duty Order

AGENCY: International Trade Administration/Import Administration, Commerce.

ACTION: Notice of revocation of countervailing duty order.

SUMMARY: The Department of Commerce is revoking the countervailing duty order on certain industrial fasteners from India because it is no longer of interest to interested parties.

EFFECTIVE DATE: January 1, 1989.

FOR FURTHER INFORMATION CONTACT: Patricia W. Stroup or Paul J. McGarr, Office of Countervailing Compliance, International Trade Administration, U.S. Department of Commerce, Washington, DC 20230; telephone: (202) 377–2786.

SUPPLEMENTARY INFORMATION:

Background

On June 30, 1989, the Department of Commerce ("the Department") published in the **Federal Register** (54 FR 27662) its intent to revoke the countervailing duty order on certain fasteners from India (45 FR 48607; July 21, 1980). Interested parties who objected to the revocation were provided the opportunity to submit their comments on or before July 31, 1989. Additionally, as required by § 355.25(d)(4)(ii)) of the Commerce Department's regulations, published in the **Federal Register** on December 27, 1988 (53 FR 52358) (to be codified at 19 CFR 355.25(d)(4)(ii), the Department served written notice of its intent to revoke this order on each interested party listed on the service list. On July 3, 1989, the Department published a notice of opportunity to request administrative review in this proceeding (54 FR 27920) for the period January 1, 1988 through December 31, 1988.

Scope of Order
